Lecture No. # 17
Three Body Problem (Contd.)

Last time we have been discussing about the restricted three body problem and then, we have started to find out about, about the lagrange points or that what we call as the librational points. We are in the synodic reference frame with respect to two primary bodies, one primary body and other secondary body, which are quite heavy with respect to a tertiary body, which is very small, infinite or say, infinitesimally small. So, at the librational point, this tertiary body, it appears to be at rest in the synodic reference frame. So, we continue with the same discussion in this lecture.

(Refer Slide Time: 01:01)

Lecture # 17 (121)

Restricted Three Body Problem

$$\ddot{x} - \omega_s^2 x - 2\omega_s \dot{y} = -\frac{\mu_1}{r_{1s}^3} (x - r_{1s}) - \frac{\mu_2}{r_{2s}^3} (x + r_{2s}) \quad (1)$$

$$\ddot{y} - \omega_s^2 y + 2\omega_s \dot{x} = -\frac{\mu_1 y}{r_{1s}^3} - \frac{\mu_2 y}{r_{2s}^3} \quad (2)$$

$$\ddot{z} = -\frac{\mu_1 z}{r_{1s}^3} - \frac{\mu_2 z}{r_{2s}^3} \quad (3)$$

$r_{1s} \equiv r_1$ $r_{2s} \equiv r_2$ $\omega_s \equiv \omega$

Integration of above three equations produces.

So, we started with the equations,

So, these are the three equations that we have started with so here for our convenience we wrote r_{1s} is equal to r_1 and r_{2s} equivalently as r_2 and ω_s can be replaced as

omega so if the integration of this three equations with respect to t it produce the jacobi's integral.

(Refer Slide Time: 03:31)

Jacobi's Integral.

$$\dot{x}^2 + \dot{y}^2 + \dot{z}^2 = x^2 + y^2 + \frac{2(1-\mu^*)}{r_1} + \frac{2\mu^*}{r_2} - C$$

$$v^2 = x^2 + y^2 + \frac{2(1-\mu^*)}{r_1} + \frac{2\mu^*}{r_2} - C = 2U - C = \phi - C$$

where, $U = \frac{1}{2}(x^2 + y^2) + \frac{1-\mu^*}{r_1} + \frac{\mu^*}{r_2}$

$\phi(x, y, z) = C$ (for $v=0$)

↳ Equation of a Surface.

So, that we wrote as integration of above three equations produced Jacobi's integral, which we wrote as x dot square plus y dot square plus z dot square is equal to x square plus y square plus 2 1 minus mu star, and the left hand side here, this is nothing, but v square. So, the same thing we wrote as v square x square y plus 2 1 minus mu star by r 1 plus by r 2 minus c and this can be written as 2 u minus c is equal to phi minus c, where u is equal to 1 by 2 times x square plus y square plus 1 minus mu star by r 1 plus mu star by r 2.

So, here the phi, which is appearing, so phi we wrote as a function of x, y, z and for v equal to 0 phi, which is a function of x, y and z. so, this describes the equation of a surface, so we will keep discussing about these things expanded further. So, what we were discussing about? The librational points and the, or the equilibrium points, which are also called the Lagrange's points. So, librational points are the Lagrange's points. They arise once we set x double dot y double dot and z double dot equal to 0 and x dot y dot z dot equal to 0 and inter substitute into these equations, and resulting equations, they provide us the librational points. So, we need to solve them.

(Refer Slide Time: 06:03)

Double point

$\frac{\partial f}{\partial x} = 0$
 $\frac{\partial f}{\partial y} = 0$

$f(x, y)$

$\rightarrow \begin{cases} \ddot{x} = \ddot{y} = \ddot{z} = 0 \\ \dot{x} = \dot{y} = \dot{z} = 0 \end{cases}$ Equilibrium points \rightarrow this gives the double points.

Librational points / Lagrange points

$-\omega^2 x = -\frac{\mu_1}{r_1^3} (x - r_{B1}) - \frac{\mu_2}{r_2^3} (x + r_{B2})$ — (4)

$-\omega^2 y = -\frac{\mu_1}{r_1^3} y - \frac{\mu_2}{r_2^3} y$ — (5)

$0 = -\frac{\mu_1}{r_1^3} - \frac{\mu_2}{r_2^3}$ — (6)

So, also I hesitate, that the librational points, that is nothing, but the double points. So, double points, they can be defined as if a curve is given, so this curve may intersect itself in a point. So, at that point, at that point we can have two tangents. So, if this curve is defined by $f(x, y)$, so $\frac{\partial f}{\partial x} = 0$ and $\frac{\partial f}{\partial y} = 0$. This gives the double points, so if we do the $\nabla f = 0$ operation on this equation, so we have the Jacobi's integral available.

So, we differentiate the Jacobi's integral or the function ϕ is equal to c , c is available to us, so we can work with this and we can prove this. So, $\phi = c$, so here we can write it as this v^2 is equal to $\phi - c$. So, with this equation it is possible to work out using this partial differential and find out the librational points or either, you directly use the equation, which we have developed earlier and set into this. The $\ddot{x} \ddot{y} \ddot{z} = 0$. Of course, here \dot{z} is not present in this equation but, this the equilibrium point also refers to the $\dot{x} \dot{y} \dot{z} = 0$, so we have the $\ddot{x} \ddot{y} \ddot{z} = 0$ and $\dot{x} \dot{y} \dot{z} = 0$. This gives us the equilibrium points or what we call as the librational points or the Lagrange points, Lagrange points.

So, rather than working with this differentiation, this partial differential, we start working with this and set into this equation, this constant. So, the solution to this will be, so last time we have worked out all those things and we saw, that the resulting equations, they

are minus omega square x r 1 cube x minus r B 1 minus mu 2 by r 2 cube x plus r B 2, and the this is our equation number 4, this is our equation number 5. And then 0 equal to minus mu 1 z by r 1 cube minus mu 2 z by r 2 cube, this is equation number 6.

So, now this, 4, 3 equations, equation number 4, 5 and 6, they can be solved to find out the values of x, y and z.

(Refer Slide Time: 09:51)

from Eq. (6)

$$\left(\frac{\mu_1}{r_1} + \frac{\mu_2}{r_2} \right) z = 0$$

↓ non zero.

$$\Rightarrow \boxed{z = 0}$$

This implies that the librational points lie in the orbital plane of the primary and secondary bodies.

Now Equations (5) and (6) can be solved to yield "x & y".

So, from equation number 6, from this equation, this is very easy to solve, we can see, that this equation can be written as mu 1 by r 1 plus mu 2 by r 2 times z equal to 0 from equation 6. Now, the quantity, which is present here, this is non-zero and therefore this implies, that z equal to 0. So, this is the solution, that we get for z equal to 0. So, this simply implies, that the point, this implies, that the librational points lie in the orbital plane of the primary and secondary bodies. Now, we can proceed to solve the equations 4 and 5.

Now, equations, 4 and 5, 5 and 6, 5 and 6 can be solved to yield, x, x and y.

(Refer Slide Time: 12:01)

$$\mu_1 = Gm_1 = m_1$$

$$\mu_2 = Gm_2 = m_2$$

$$m_1 + m_2 = 1$$

$$\mu_1 = m_1 = 1 - \mu^*$$

$$\mu_2 = m_2 = \mu^*$$

$$-y = - \frac{1 - \mu^*}{r_1^3} y - \frac{\mu^*}{r_2^3} y$$

$$\left(\frac{1 - \mu^*}{r_1^3} + \frac{\mu^*}{r_2^3} \right) y = y$$

So, solving the equation 5 and 6 we can do in the normalized form and also, we can do in the not non-normalized form, so both are possible. So, on the normalized scale what we have seen, that we set μ_1 is equal to Gm_1 and G we set as 1, so therefore, this got reduced to m_1 . And similarly, we have μ_2 is equal to, Gm_2 is equal to m_2 . Moreover, we wrote m_1 as $m_1 + m_2$, this is equal to 1 and then we defined m_1 as 1 minus μ^* and m_2 is equal to, μ^* . So, we have this equation number, sorry, this is equation number 4 and 5, this is not 5 and 6, so we have equation number 4 and equation number 5, which is related to the x and y coordinates.

So, from equation number 5 we have minus y equal to μ_1 is nothing, but m_1 is equal to 1 minus μ^* and μ_2 , similarly is this quantity here. So, we can simply write this as 1 minus μ^* . You can have a look of this equation again, so we are replacing in this quantity, μ_1 is nothing, but 1 minus μ^* . Similarly, μ_2 is μ^* . So, this will be replaced by 1 minus μ^* divided by r_1^3 y minus μ^* r_2^3 and y . We can rearrange them, so 1 minus μ^* by r_1^3 plus by r_2^3 .

(Refer Slide Time: 14:52)

$$\mu_2 = h \mu_2 = m_2$$

$$\mu_1 = h \mu_1 = 1 - \mu^*$$

$$\mu_2 = m_2 = \mu^*$$

from Eq. (5)

$$-y = -\frac{1-\mu^*}{r_1^3} y - \frac{\mu^*}{r_2^3} y$$

$$\left(\frac{1-\mu^*}{r_1^3} + \frac{\mu^*}{r_2^3} \right) y = y$$

and assuming $y \neq 0$.

$$\Rightarrow \boxed{\frac{1-\mu^*}{r_1^3} + \frac{\mu^*}{r_2^3} = 1}$$

And assuming y not equal to 0 in this equation, so this leads to this, implies 1 minus μ star by r_1 cube plus μ star by r_2 cube, this is equal to 1.

(Refer Slide Time: 15:19)

$$-x = -\frac{1-\mu^*}{r_1^3} (x - \mu^*) - \frac{\mu^*}{r_2^3} (x + 1 - \mu^*)$$

Substituting Eq. (7) into Eq. (8).

$$-x = -\left[\frac{1-\mu^*}{r_1^3} + \frac{\mu^*}{r_2^3} \right] x + \frac{\mu^*}{r_2^3} (1 - \mu^*) - \frac{\mu^*}{r_1^3}$$

$$x = x + \frac{\mu^*}{r_2^3} (1 - \mu^*) - \frac{\mu^*}{r_1^3}$$

Now, from equation 4, minus x is equal to minus 1 minus μ star by r_1 cube x minus μ star. Here, this quantity is nothing, but $x B 1$, this we have explained in earlier lecture, μ star by r_2 cube times x plus 1 minus μ star.

So, the solution, that we got here, this we can write as equation number 7. Let us say this is equation number 8. So, substituting, **equation 8 into**, equation 7 into equation 8, so first we will sort out the common terms, so this we can write as minus sign, we can cancel on both sides, so let us remove the minus sign at this stage itself. So, 1 minus mu star r 1 cube x and from here we sort it out, that is, mu star by r 2 cube times x and then from this place we will have plus mu star r 2 whole cube times 1 minus mu star minus mu star times 1 minus mu star divided by r 1 whole cube. So, if we substitute from equation from equation 7 this quantity into this, so this become x is equal to x plus mu star r 2 whole cube 1 minus mu star.

(Refer Slide Time: 18:12)

Substituting Eq. (7) into Eq. (8).

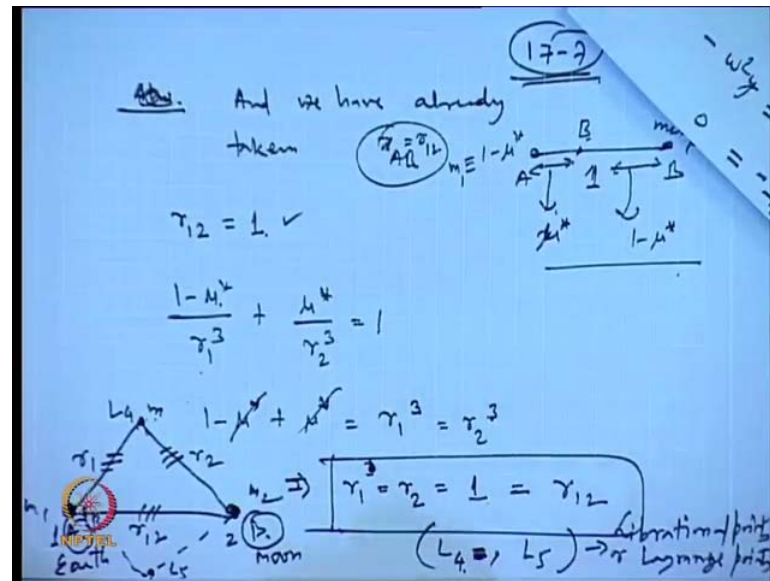

$$x = x \left[\frac{1 - \mu^*}{r_1^3} + \frac{\mu^*}{r_2^3} \right] + \frac{\mu^*}{r_2^3} (1 - \mu^*) - \frac{\mu^*}{r_1^3}$$

$$\cancel{x} = \cancel{x} + \frac{\mu^*}{r_2^3} (1 - \mu^*) - \frac{\mu^*}{r_1^3}$$

$$\frac{1}{r_1^3} = \frac{1}{r_2^3} \Rightarrow \boxed{r_1 = r_2} \quad \text{--- (9)}$$

This is **r 1** r 2 whole cube and this is r 1 whole cube, so these 2 cancel out, leaving us with r 1 cube is equal to r 2 cube. So, this simply implies, r 1 is equal to r 2, so this is our result number 9.

(Refer Slide Time: 18:31)

And we have already taken the distance x AB, that is, the distance between these two particles A and B as 1. And if this is the point B, so from here we measured this distance as, this mass was 1 minus μ^* and this distance we measured as, wrote as μ^* and this distance we wrote as 1 minus μ^* , and this mass as μ^* . Therefore, this is m_2 , so this we are replacing with μ^* and m_1 we are replacing with 1 minus μ^* .

So, already our distance r_{12} or x AB we can write as r_{12} . So, r_{12} equal to 1, this we have already written. So, if we have that some equation number 7, this is our equation number 7, now in this equation if we substitute r_1 is equal to r_2 , so this will yield us 1 minus μ^* times μ^* is equal to r_1^3 is equal to r_2^3 . So, this cancels out and this implies r_1 is equal to r_2 is equal to 1. And therefore, this quantity is nothing, but equal to r_{12} .

So, it shows, that the equilibrium points, they lie in an equilateral triangle. So, here the points we have, the point number 1, which is indicated by A; the point number 2, which is indicated by B. So, this is m_1 , m_2 and the mass m . So, this distance was our r_1 and this distance was r_2 and this is r_{12} . So, this one is equal to this one and this one, and on a normalized scale they are equal to 1. Therefore, they, these three points, they lie in the equilateral triangle. So, from here it is obvious, that one point will lie here, another point will appear here downwards, somewhere here in this place.

So, if I, we have the earth here in this place and this is our moon, so for the earth moon system one point will appear here, another point will appear here in this point and they will appear always at the same distance because here, because it is equilibrium point. So, this mass is going to appear from these two places to be always present in the same point. So, as the moon is moving and the earth is also moving, so the they have their bary centre somewhere lying. Suppose, this is the heavy, heaviest mass, the earth is here. So, suppose bary centre is lying here in this place somewhere, this is our point B, so earth will be moving along, around this point and the moon will also be moving around this point. So, this is our earth and this is our moon. So, you got this point, they are moving like this and while the m is remaining at a constant distance from this point and this point, so it will always appear in the same point.

And later on, we will discuss more about this graphically, how the whole thing looks like. So, beside these two points, so this we can name as the L 4 and the L 5. So, L 5 will appear down, downwards somewhere in this place. So, this, this solution will, later on we will see, we will find out using the, by solving these equations 4, 5 and 6. We will find out the values x and y from this place and obviously, of z also, and these are going to give us the points L 4 and L 5. So, these are our librational points; librational points are Lagrange points.

(Refer Slide Time: 23:41)

Alternatively we work in terms of Equ (4), (5) & (6)

from Eq. (6) we can write.

$$\left(\frac{m_1}{r_1} + \frac{m_2}{r_2} \right) z = 0 \Rightarrow z = 0$$

— (9) because quantity in bracket is non zero

So, alternately, we work in terms of equation 4, 5 and 6. So, this is going to produce a more general result and from there we will further develop and look into graphically what does it mean to have the librational points and how according to the variation in v . So, either I can have the 0 velocity, which is the bonding surface beyond which the particle cannot go or if we have v , which is positive, which is always positive. So, if we have certain positive value of the v , so how the particles will be moving? The 3rd particle will be moving with respect to this primary and the secondary bodies m_1 and m_2 .

So, from, from equation 6 we can write, this is our equation number 6, so from here it is apparent z equal to 0. So, from equation 6 we have μ_1 plus r_1 plus μ_2 by r_2 and z equal to 0. So, simply this implies z equal to 0 because quantity in bracket is non-zero. So, here we term this as equation number 9; so, this is our equation number 9.

(Refer Slide Time: 26:05)

$$-\omega^2 y = -\frac{\mu_1}{r_1^3} y - \frac{\mu_2}{r_2^3} y \quad (6)$$

$$0 = -\frac{\mu_1}{r_1^3} y - \frac{\mu_2}{r_2^3} y \quad (5)$$

from Eq. (6) we can write.

$$\left(\frac{\mu_1}{r_1} + \frac{\mu_2}{r_2}\right) z = 0 \Rightarrow z = 0 \quad (9)$$

because quantity in bracket is non zero.

from Eq. (5)

$$\omega^2 = \frac{\mu_1}{r_1^3} + \frac{\mu_2}{r_2^3} \quad (10) \quad y \neq 0$$

Now, for, from equation number 5 we get ω^2 , this is equal to μ_1 by r_1 cube plus μ_2 by r_2 cube, assuming why this is not equal to 0. So, this is our equation number 10.

(Refer Slide Time: 26:51)

From Eq. (4)

$$\omega^2 x = \frac{\mu_1}{r_1^3} (x - r_{B1}) + \frac{\mu_2}{r_2^3} (x + r_{B2}) \quad (11)$$

from eq (10) Putting Equation (10) into Equation (11).

Rearranging.

$$\omega^2 x = \left(\frac{\mu_1}{r_1^3} + \frac{\mu_2}{r_2^3} \right) x + \left(\frac{\mu_2}{r_2^3} r_{B2} - \frac{\mu_1}{r_1^3} r_{B1} \right)$$

$$\cancel{\omega^2 x} = \cancel{\omega^2 x} + \left(\frac{\mu_2}{r_2^3} r_{B2} - \frac{\mu_1}{r_1^3} r_{B1} \right)$$

$$\Rightarrow \frac{\mu_2}{r_2^3} r_{B2} = \frac{\mu_1}{r_1^3} r_{B1} \quad (12)$$

And equation number 4 gives us, so from equation 4 $\omega^2 x$, this will be equal to μ_1 by r_1 cube minus μ_2 by r_2 cube x plus r_{B2} . This is equation number 11.

Now, from equation 10, so if we put the equation 10, equation 10 into equation 11, so what we can do? So, before this we need to little rearrange this, so rearrange. So, already we have done the rearrangement earlier, this we can write as μ_1 by r_1 cube plus μ_2 by r_2 cube x plus μ_2 by r_2 cube r_{B2} minus μ_1 by r_1 cube r_{B1} . So, this quantity we can substitute from equation number 10. So, this quantity is nothing, but $\omega^2 x$. So, $\omega^2 x$ and $\omega^2 x$ this cancels out, as earlier we have done in the normalized form, but here in this format we are going to get little more inside. So, this is μ_2 minus μ_1 , so they cancel out and this implies μ_2 by r_2 cube times r_{B2} , and this we term as our equation number 12.

(Refer Slide Time: 30:19)

Moreover, Eq. (10) can be written as. (12-10)

$$U = G(m_1 m_2 / r_{12})$$

$$\omega^2 = \frac{\mu}{r_{12}^3} = \frac{\mu_1}{r_1^3} + \frac{\mu_2}{r_2^3} \quad \text{--- (13)}$$

Also we know that

$$r_{B1} + r_{B2} = r_{12} \quad \text{--- (14)}$$

$$m_1 r_{B1} = m_2 r_{B2} \quad \text{--- (15)}$$

From Eq. (15)

$$\frac{m_1}{m_2} = \frac{r_{B2}}{r_{B1}} = \frac{\mu_1}{\mu_2} \quad \text{--- (16)}$$

Moreover, equation 10 can be written as μ by r_{12} whole cube because ω square is equal to nothing, but μ by r_{12} whole cube, where r_{12} is the distance between the points A and B and μ is nothing, but here, μ is nothing, but G times m_1 plus m_2 . So, this is equal to μ_1 by r_1 cube plus μ_2 by r_2 cube.

Also, we know, that r_{B1} plus r_{B2} , this is equal to r_{12} , the total distance between the point 1 and 2. And moreover, m_1 times r_{B1} equal to m_2 times r_{B2} . So, these two results can be utilized along with the equation, that we have just now written, equation number 12 to data useful results. So, from this we can write as 12, this is 13th, this we can term as 14 and this 15. So, from equation 15 we have m_1 by m_2 is equal to r_{B2} by r_{B1} and m_1 by m_2 . If we multiply up and down by G , so this will be nothing, but equal to μ_1 by μ_2 . So, this is our equation number 16.

(Refer Slide Time: 32:48)

$$\Rightarrow \frac{\mu_2}{r_2^3} = \frac{\mu_1}{r_1^3} r_{B1} \quad \text{--- (12)}$$

$$\mu_1 + \mu_2 = \mu \quad \text{--- (17)}$$

Inserting these results into Eq. (13)

$$\frac{\mu}{r_{12}^3} = \frac{\mu_1}{r_1^3} + \frac{\mu_1}{r_1^3} \times \frac{r_{B1}}{r_{B2}} = \frac{\mu_1}{r_1^3} \left(1 + \frac{r_{B1}}{r_{B2}} \right)$$

$$\Rightarrow \frac{\mu_1}{r_1^3} \times \frac{r_{12}}{r_{B2}} = \frac{\mu}{r_{12}^3} \quad \text{--- (18)}$$

Similarly

$$r_{12} \frac{\mu_1}{r_1^3} = \frac{\mu}{r_{12}^3} r_{B2}$$

Also, we will have $\mu_1 + \mu_2 = \mu$, this we write as equation number 17. Now, it is inserting into the equation number, equation number 13. So, inserting these results into equation 13.

So, we will have μ by r_{12} whole cube, this is equal to μ_1 by r_1 cube plus μ_1 by, now μ_2 by r_2 cube we need to replace, so μ_2 by r_2 cube we can replace from equation number 12; μ_2 by r_2 cube, it can be replaced from equation 12. So, μ_2 by r_2 cube, this becomes μ_1 by r_1 cube times r_{B1} by r_{B2} . We can take it out μ_1 by r_1 cube, this gives us $r_{B1} r_{B2}$. So, this implies μ_1 by r_1 cube and this we can sum it up. So, $r_{B1} + r_{B2}$, this is nothing, but equal to r_{12} . So, we can write this as r_{12} divided by r_{B2} is equal to μ by r_{12} whole cube.

Now, similarly, μ_2 by r_2 cube, so we will do little more expansion, we will write it little more properly. So, we will write this as μ_1 by r_1 cube is equal to μ by, r_{12} is equal to r_{12} whole cube times r_{B2} .

(Refer Slide Time: 36:47)

Handwritten derivation on a blue background. At the top right, there is a circled label "17-12" and a small box containing "© CEE I.I.T. KGP". The text "Similarly we can write" is written in cursive. Below it, the phrase "by putting from eq (19)" is written. The main equation is:
$$\frac{\mu_2}{r_2^3} = \frac{\mu_1}{r_1^3} \times \frac{r_{B1}}{r_{B2}}$$
This is followed by a simplification:
$$= \frac{\mu_1 \cancel{r_{B2}}}{r_{12}^3} \times \frac{r_{B1}}{\cancel{r_{B2}}} = \frac{\mu_1}{r_{12}^3} r_{B1}$$
At the bottom, the final result is boxed and labeled with a circled "20":
$$r_{12} \frac{\mu_2}{r_2^3} = \frac{\mu_1}{r_{12}^3} r_{B1}$$
An NPTEL logo is visible in the bottom left corner of the slide.

Similarly, we can write, this is the result, that we got earlier μ_2 by r_2 cube, this is a result, that we had in the equation number 12. So, we, we utilize this result, so this quantity will be equal to, now μ times r_{B2} . So, we have here this equation we can utilize, let us name this also as equation number 19.

So, from here we will have, so if we can take out from μ_1 by r_1 cube from here and insert into this equation here in this place, so this is our, and inserting into this equation. Similarly, we can write this by putting from equation 19. So, μ_1 and μ_1 by r_1 cube we are replacing here, so this comes in terms of this quantity is here, μ times r_{B2} divide the r_2 to the power of 4 times r_{B1} by r_{B2} , this cancels out and what we get is... or r_{12} times μ_2 by $r_{12} r_2$ whole cube. This is equal to μ by r_{12} whole cube r_{B1}

Now, all these equations can be utilized, so this is our equation number 20.

(Refer Slide Time: 39:42)

from Eqs. (19) & (20) 17-13

$$\frac{r_{12}^4}{r_1^3} \mu_1 = \frac{\mu}{r_{12}^3} r_{B2}$$

$$\Rightarrow \frac{r_{12}^4}{r_1^3} = \frac{\mu}{\mu_1} r_{B2} \quad \leftrightarrow \quad \frac{r_{12}^4}{r_2^3} = \frac{\mu}{\mu_2} r_{B1}$$

$$= \left(\frac{\mu_1 + \mu_2}{\mu_1} \right) r_{B2} \quad \quad = \left(\frac{\mu_1 + \mu_2}{\mu_2} \right) r_{B1}$$

$$= \left(1 + \frac{\mu_2}{\mu_1} \right) r_{B2} \quad \quad = \left(1 + \frac{\mu_1}{\mu_2} \right) r_{B1}$$

To find out the relevant relationship between these quantities, so we can look into equation number 19 and 20. So, from equations 19 and 20, r_{12} whole cube, r_{12} by r_1 , this r_{12} by r_1 whole cube times μ_1 , this is equal to μr_{B2} , this is one equation. Another we get r_{12} to the power 4 from equation number 20 to the power r_2 cube time is equal to μ by μ_2 times r_{B1} . So, these are the two equations after rewriting we are getting. So, from here the useful results can be derived. So, if we expand them further, so this can be written as μ_1 plus μ_2 divided by μ_1 times r_{B2} . So, this is nothing, but 1 plus μ_2 by μ_1 times r_{B2} and here this will yield us μ_1 plus μ_2 divided by μ_2 times r_{B1} , 1 plus μ_1 by μ_2 times r_{B1} .

(Refer Slide Time: 43:34)

we can express r_{B2} in terms of r_{B1}

$$r_{B2} = \frac{\mu_1}{\mu_2} r_{B1}$$

Eq. (21) will lead to

$$\frac{r_{12}^4}{r_1^3} = \left(1 + \frac{\mu_2}{\mu_1}\right) \times \frac{\mu_1}{\mu_2} r_{B1} = \left(1 + \frac{\mu_1}{\mu_2}\right) r_{B1}$$

(23)

Now, both the equations, they are available here. So, these equations, let us say this is our 21 and this is 22. So, r_{B2} can be expressed in terms of r_{B1} , so we can express r_{B2} in terms of r_{B1} , which we have written earlier. So, r_{B2} is nothing, but μ_1 by μ_2 times r_{B1} . So, use this result to resolve the things further. So, this becomes the equation, 20, 21 will become equation 20 will lead to r_{12} to the power 4 r_1 cube. This becomes 1 plus μ_2 by μ_1 times μ_1 by μ_2 times r_{B1} . So, here we can cancel out μ_1 if we multiply in sides, so this becomes 1 plus μ_1 by μ_2 times r_{B1} . So this we name as equation number 23.

Now, we can compare equation number 23 and this equation number 22. So, we have in equation number 22, r_{12} to the power 4 by r_2 whole cube equal to, on the right hand side, 1 plus μ_1 by μ_2 times r_{B1} . And this equation on the right hand side also, we have 1 plus μ_1 by μ_2 times r_{B1} , while the left side differs.

Equating Eqs (22) & (23)

$$\frac{r_{12}^4}{r_2^3} = \frac{r_{12}^4}{r_1^3} \Rightarrow \frac{1}{r_1} = \frac{1}{r_2} \Rightarrow r_1 = r_2$$

also from Eq. (21)

So, by equating these two equations 22 and 23, equating equations 22 and 23, this will give us r_{12} to the power 4 by r_2 whole cube equal to r_{12} to the power 4 by r_1 whole cube and this implies 1 by r_1 is equal to 1 by r_2 and this implies r_1 is equal to r_2 .

(Refer Slide Time: 45:56)

also from Eq. (21)

$$\frac{r_{12}^4}{r_1^3} = \frac{\mu_2}{\mu_1} r_{B1} = \left(1 + \frac{\mu_2}{\mu_1}\right) r_{B1}$$

$$= \left(1 + \frac{r_{B2}}{r_{B1}}\right) r_{B1} = r_{B1} + r_{B2} = r_{12}$$

Also, from equation 21, r_1 to the power 4 divided by r_1 cube, this is equal to μ_2 by μ_1 times r_{B1} is equal to, this we have written as 1 plus μ_2 by μ_1 , this quantity we can replace as r_{B2} by r_{B1} multiplied by r_{B1} . So, this leads up to r_{B1} plus r_{B2} is equal to r_{12} .

(Refer Slide Time: 47:14)

$\Rightarrow \frac{r_{12}^4}{r_1^3} = r_{12} \Rightarrow r_1 = r_{12} \quad (25)$
 from (24) & (25)
 $r_1 = r_2 = r_{12}$
 \Rightarrow The three point masses lie on an equilateral triangle.

So, this implies, r_1 to the power 4 by r_1 whole cube is equal to, r_1 , r_{12} , and this implies r_1 is equal to r_{12} . Therefore, from this result, this is result number, we can write this as 24, and this we can write as 25. So, from 24 and 25 we get r_1 is equal to r_2 is equal to r_{12} . This is what the result we established on the normalized skill. So, there it was very easy while here it took some time to work it out. So, this implies the three points, three points are the three masses lie on an equilateral triangle.

(Refer Slide Time: 49:21)

$x + y$
 $r_1^2 = (x - r_{B1})^2 + y^2 = r_{12}^2 \quad (26)$
 $r_2^2 = (x + r_{B2})^2 + y^2 = r_{12}^2 \quad (27)$
 from (26) & (27) we can write
 $(x - r_{B1})^2 + y^2 = (x + r_{B2})^2 + y^2$
 $\Rightarrow x - r_{B1} = \pm (x + r_{B2}) \quad (28)$

Now, we have once worked out all things, so next we can look into the, what will be the values of x and y . So, we need to work it out working for values of x and y . So, we know, that x minus r_{B1} square plus y square, this is the quantity r_{12} square. And similarly, we have x plus r_{B2} , this is our equation number 26 and this is 27. So, utilizing the previous results and here we have already, we see, that the right hand side in both the cases. Therefore, they are referring to the same quantities because this distance we wrote as r_1 , r_1 square and this distance we wrote as r_2 square. So, this quantity was, because we have already proved, that r_1 equal to r_2 is equal to r_{12} , so from 26 and, equation 26 and 27 we can write x minus r_{B1} x plus r_{B2} square plus y square. So, this implies x minus r_{B1} is equal to plus minus x plus r_{B2} .

(Refer Slide Time: 51:29)

$$r_{B1} + r_{B2} = r_{12}$$

$$r_{B1} = r_{12} - r_{B2}$$

$$= r_{12} - \frac{\mu_1}{\mu_2} r_{B1}$$

$$r_{B1} \left(1 + \frac{\mu_1}{\mu_2} \right) = r_{12}$$

$$\Rightarrow \boxed{r_{B1} = \frac{r_{12} \mu_1}{\mu_1 + \mu_2}} \quad -29-$$

Next, we utilize some of the results, like we can prove it, r_{B1} plus r_{B2} , this we have already written as equal to r_{12} . So, from here it can be written as r_{B2} , so r_{B1} is equal to r_{12} minus r_{B2} and r_{B2} again can be written as μ_1 by μ_2 times r_{B1} . And therefore, r_{B1} , earlier also we have proved this result, r_1 times r_{B1} times 1 plus μ_1 by μ_2 , this becomes r_{12} and this implies r_{B1} is equal to r_{12} μ_1 divided by μ_1 plus μ_2 .

(Refer Slide Time: 52:55)

from Eq. (28)

$$x - r_{B1} = - (x + r_{B2})$$

$$\Rightarrow 2x = r_{B1} - r_{B2}$$

$$x = \frac{1}{2} (r_{B1} - r_{B2})$$

$$= \frac{1}{2} \left(\frac{\mu_2 \mu_1}{\mu_1 + \mu_2} - \frac{\mu_1}{\mu_2} r_{B2} \right)$$

$$= \frac{1}{2} \left(r_{B1} - \frac{\mu_1}{\mu_2} r_{B1} \right) = \frac{1}{2} \left(\frac{\mu_2 - \mu_1}{\mu_2} \right) r_{B1}$$

Now, from equation 28, taking negative sign we can write this as, x is equal to $\frac{1}{2} r_{B1} - r_{B2}$. So, r_{B1} , r_{B2} we have right now expressed, so you can, we can use those expression to resolve it further. So, inserting for r_{B1} and r_{B2} , this is $\frac{\mu_2 \mu_1}{\mu_1 + \mu_2}$ divided by μ_1 plus here. We have in this equation μ_1 plus μ_2 times r_{B1} , this is μ_2 here, this is μ_2 minus r_{B2} , we have written as μ_1 by μ_2 times r_{B1} . So, we can simplify it first and then we can write it again $\frac{1}{2} r_{B1} - r_{B2}$. We can write as μ_1 by μ_2 times r_{B1} . So, this becomes $\frac{1}{2} \mu_2$ minus μ_1 by μ_2 times r_{B1} .

(Refer Slide Time: 54:55)

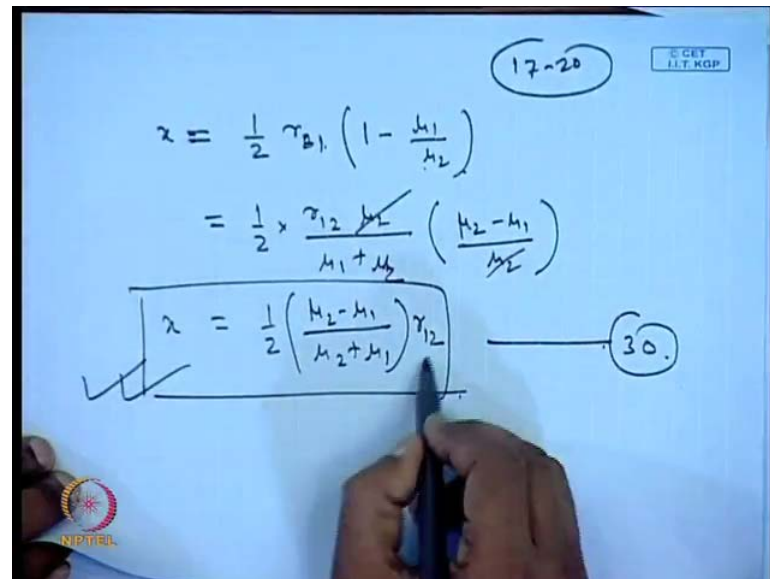

$$x = \frac{1}{2} r_{B1} \left(1 - \frac{\mu_1}{\mu_2} \right)$$

$$= \frac{1}{2} \times \frac{\mu_2 \mu_1}{\mu_1 + \mu_2} \left(\frac{\mu_2 - \mu_1}{\mu_2} \right)$$

$$\boxed{x = \frac{1}{2} \left(\frac{\mu_2 - \mu_1}{\mu_2 + \mu_1} \right) r_{B1}} \quad \text{--- (30)}$$

So, what we get x as $\frac{1}{2} r_{B1} (1 - \frac{\mu_1}{\mu_2})$, and r_{B1} we have already written in terms of r_{12} . So, this becomes $\frac{1}{2} r_{12} \frac{\mu_2 - \mu_1}{\mu_2 + \mu_1}$ and then multiplied by $\mu_2 - \mu_1$ by μ_2 , so they cancel out. Ultimately, we get $\mu_2 - \mu_1$ by $\mu_2 + \mu_1$. So, this is the value of x that we get and multiplied by of course, r_{12} . So, this is our equation number, this is 30.

(Refer Slide Time: 56:16)

$$\begin{aligned}
 x &= \frac{1}{2} r_{B1} \left(1 - \frac{\mu_1}{\mu_2} \right) \\
 &= \frac{1}{2} \times \frac{r_{12} \cancel{\mu_2}}{\mu_1 + \mu_2} \left(\frac{\mu_2 - \mu_1}{\cancel{\mu_2}} \right) \\
 \boxed{x} &= \frac{1}{2} \left(\frac{\mu_2 - \mu_1}{\mu_2 + \mu_1} \right) r_{12} \quad \text{--- (30)}
 \end{aligned}$$

Now, we can work out for y, so we can work along the same line. x we can substitute from here, so this will be $\frac{1}{2} r_{12} \frac{\mu_2 - \mu_1}{\mu_2 + \mu_1}$ by $\mu_2 - \mu_1$ by $\mu_2 + \mu_1$. Now, r_{B1} can be written in terms of r_{12} . So, after that simplification you can write this as $\frac{1}{2} \frac{\mu_2 - \mu_1}{\mu_2 + \mu_1} r_{12}$ by $\frac{\mu_2 - \mu_1}{\mu_2 + \mu_1}$. And further simplification of this can be done, so we will continue next time. So, will see, that y can be written as $\frac{\mu_2 - \mu_1}{\mu_2 + \mu_1} r_{12}$.

(Refer Slide Time: 58:14)

$$x = \frac{1}{2} \left(\frac{\mu_2 - \mu_1}{\mu_2 + \mu_1} \right) r_{12} \quad (30.)$$
$$y = \pm \frac{\sqrt{2}}{2} r_{12} \quad z=0$$

So, we can see, that the x and y , both have been written in terms of r_{12} , which is the distance between the points A and B , so these two useful results. And z we have already written, that, in that z equal to 0 . So, using this we will be able to find out where the point is exactly located.

So, we continue with these things next time and beside this these are the two points, beside this we have three points, other points, which are collinear, that is, the line is the same, on the same line. So, those three points how to work them out, that we will see next time.

Thank you very much.
