**Static Analysis of beam for Induced Strain Actuation using Energy Principles**  
**(continued)**  
**Part 06**

In the last lecture, we started with the virtual work equation for this beam with piezo's and from those equations, we saw how we can get a governing equation that we are familiar with.

Now, we will see how by starting from the same virtual work equation, we can get a governing equation in a different form. So, again we look at equilibrium equation, but we will derive it in a different form. So, after we start with the virtual work equation, we obtained this form.

(Refer Slide Time: 1:45)

Induced strain beam actuation governing equations  
in a different form

$$\int_0^L \left( EA_{tot} \frac{\partial u_0}{\partial x} + ES_{tot} \frac{\partial^2 w}{\partial x^2} - N_p \right) \delta \left( \frac{\partial u_0}{\partial x} \right) dx$$

$$+ \int_0^L \left( ES_{tot} \frac{\partial u_0}{\partial x} + EI_{tot} \frac{\partial^2 w}{\partial x^2} - M_p \right) \delta \left( \frac{\partial^2 w}{\partial x^2} \right) dx - \int_0^L p_x \delta u_0 dx - \int_0^L p_z \delta w dx = 0$$

Smart Structure

So, if I don't shift the derivatives here, if I don't do the integration by parts, if we written it as it was, we have it here and rest of it we know how to get. Now, what we will do is instead of integrating by parts here and here, we will do the integration by parts here and here, and that will give us a governing differential equation in a different form. So, if we look at the first term which was our integral E A total, if I integrate by parts, it gives me: E A total,

del  $u_0$  by del  $x$  multiplied by integral of this and integral of this, is nothing but delta of  $u_0$  and it is evaluated at  $x$  equal to 0 and  $L$  and then we have minus of differentiation of this. So, del del  $x$  of  $E A_{tot}$ , del  $u_0$  by del  $x$ , multiplied by integral of that. So, delta of  $u_0$  0 to  $L$  dx. So, we can see it here, these terms. So, these terms come from this.

$$\int_0^L EA_{tot} \frac{\partial u_0}{\partial x} \delta \left( \frac{\partial u_0}{\partial x} \right) dx \Rightarrow EA_{tot} \frac{\partial u_0}{\partial x} \delta u_0 \Big|_0^L - \int_0^L \frac{\partial}{\partial x} \left( EA_{tot} \frac{\partial u_0}{\partial x} \right) \delta u_0 dx$$

Similarly, we can do the same thing for the next term where we have delta of del  $u_0$  by del  $x$  multiplied by  $E S_{tot}$ , into del  $w$  by del  $x$ . After we do the integration by parts, we get this term. And then, we had  $N_p$  multiplied by delta of del  $u_0$  by del  $x$  and that were integrated from 0 to  $L$ . So, if I do integration by parts here, it gives me  $N_p$  multiplied by the integral of this, which is delta of  $u_0$  0 to  $L$  minus del  $N_p$  by del  $x$  into variation of  $u_0$ , and which we can see here. So, this had a negative sign before. So, that is why it was negative, it is positive, what we see here.

$$\int_0^L N_p \delta \left( \frac{\partial u_0}{\partial x} \right) dx \Rightarrow N_p \delta u_0 \Big|_0^L - \int_0^L \frac{\partial N_p}{\partial x} \delta u_0 dx$$

Then we had a term like  $E S_{tot}$ , multiplied by del  $u_0$  by del  $x$ , multiplied by variation of the second order derivative of  $w$  and this was integrated from 0 to  $L$ . If I integrate this by part, that gives me  $E S_{tot}$ , del  $u_0$  by del  $x$  variation of delta  $w$  by del  $x$ , which is evaluated at the limit 0 and  $L$ . And then, minus I would have derivative of this and integral of this. So, now, the other term that I get as minus, I am writing here, multiplied by variation of del  $w$  by del  $x$ . But again, if I integrate this by parts, this would give me minus del by del  $x$ ,  $E S_{tot}$ , multiplied by variation of  $w$  and that gets evaluated at 0 to  $L$ . And then, plus this differentiated twice,  $E S_{tot}$ . So, here this term is missing, it is  $E S_{tot}$ , del  $u_0$  by del  $x$  multiplied by delta  $w$ . And here, we have the same thing, but differentiated once more multiplied by delta  $w$  dx. So, that is how we get this term, this term and this term. Accordingly, we can find out rest of the terms by doing the integration by parts and we get this entire expression.

$$\begin{aligned} & \int_0^L ES_{tot} \frac{\partial u_0}{\partial x} \delta \left( \frac{\partial^2 w}{\partial x^2} \right) dx \\ & \Rightarrow ES_{tot} \frac{\partial u_0}{\partial x} \delta \left( \frac{\partial w}{\partial x} \right) \Big|_0^L - \left[ \frac{\partial}{\partial x} \left( ES_{tot} \frac{\partial u_0}{\partial x} \right) \delta w \right] \Big|_0^L \\ & + \int_0^L \frac{\partial^2}{\partial x^2} \left( ES_{tot} \frac{\partial u_0}{\partial x} \right) \delta w dx \end{aligned}$$

(Refer Slide Time: 7:29)

$$\begin{aligned}
 & EA_{tot} \frac{\partial u_0}{\partial x} \delta u_0 \Big|_0^L - \int_0^L \frac{\partial}{\partial x} \left( EA_{tot} \frac{\partial u_0}{\partial x} \right) \delta u_0 dx + ES_{tot} \frac{\partial^2 w}{\partial x^2} \delta u_0 \Big|_0^L - \int_0^L \frac{\partial}{\partial x} \left( ES_{tot} \frac{\partial^2 w}{\partial x^2} \right) \delta u_0 dx \\
 & + ES_{tot} \frac{\partial u_0}{\partial x} \delta \left( \frac{\partial w}{\partial x} \right) \Big|_0^L - \frac{\partial}{\partial x} \left( ES_{tot} \frac{\partial u_0}{\partial x} \right) \delta w \Big|_0^L + \int_0^L \frac{\partial^2}{\partial x^2} \left( ES_{tot} \frac{\partial u_0}{\partial x} \right) \delta w dx \\
 & + EI_{tot} \frac{\partial^2 w}{\partial x^2} \delta \left( \frac{\partial w}{\partial x} \right) \Big|_0^L - \frac{\partial}{\partial x} \left( EI_{tot} \frac{\partial^2 w}{\partial x^2} \right) \delta w \Big|_0^L + \int_0^L \frac{\partial^2}{\partial x^2} \left( EI_{tot} \frac{\partial^2 w}{\partial x^2} \right) \delta w dx \\
 & - \int_0^L p_x \delta u_0 dx - \int_0^L p_z \delta w dx - N_p \delta u_0 \Big|_0^L + \int_0^L \frac{\partial}{\partial x} (N_p) \delta u_0 dx \\
 & - M_p \delta \left( \frac{\partial w}{\partial x} \right) \Big|_0^L + \frac{\partial M_p}{\partial x} \delta w \Big|_0^L - \int_0^L \frac{\partial^2 M_p}{\partial x^2} \delta w dx = 0
 \end{aligned}$$

Handwritten notes in red ink on the right side of the slide:

$$\begin{aligned}
 & \int_0^L EA_{tot} \frac{\partial u_0}{\partial x} \delta \left( \frac{\partial u_0}{\partial x} \right) dx \\
 & \Rightarrow EA_{tot} \frac{\partial u_0}{\partial x} \delta u_0 \Big|_0^L \\
 & - \int_0^L \frac{\partial}{\partial x} (EA_{tot} \frac{\partial u_0}{\partial x}) \delta u_0 dx \\
 & \int_0^L N_p \delta \left( \frac{\partial u_0}{\partial x} \right) dx \\
 & \Rightarrow N_p \delta u_0 \Big|_0^L - \int_0^L \frac{\partial N_p}{\partial x} \delta u_0 dx \\
 & \int_0^L ES_{tot} \frac{\partial u_0}{\partial x} \delta \left( \frac{\partial^2 w}{\partial x^2} \right) dx \\
 & = \left[ ES_{tot} \frac{\partial u_0}{\partial x} \delta \left( \frac{\partial^2 w}{\partial x^2} \right) \right]_0^L - \int_0^L \frac{\partial}{\partial x} (ES_{tot} \frac{\partial u_0}{\partial x}) \delta w dx \\
 & + \int_0^L \frac{\partial^2}{\partial x^2} (ES_{tot} \frac{\partial u_0}{\partial x}) \delta w dx
 \end{aligned}$$

Smart Structure

Now, if we look at this entire expression, we can see that the variations are in  $\delta u_0$ ,  $\delta w$  by  $\delta x$ , and that is all. So, if we separate out the components, that are multiplied with delta of  $u_0$ , delta of  $w$ , and delta of  $\delta w$  by  $\delta x$ , we get this. In this expression, we have these two terms that are integrated, whereas, these expressions are: these three expressions are all defined at the boundaries. Now, if we look at these boundary terms, we can see that, this is nothing but our  $N$ , normal force  $N$ .

So, this thing inside the bracket is normal force  $N$ . Why? Because, we have seen so far, that  $EA_{tot}$ , plus  $ES_{tot}$ , multiplied  $EA_{tot}$ ,  $\delta u_0$  by  $\delta x$ , plus  $ES_{tot}$ ,  $\delta^2 w$  by  $\delta x^2$ , minus  $N_p$ , minus  $N$ , equal to 0, which means that this equal to  $N$ . So, this is equal to  $N$  here.

$$EA_{tot} \frac{\partial u_0}{\partial x} + ES_{tot} \frac{\partial^2 w}{\partial x^2} - N_p - N = 0$$

Similarly, using the same reason, this is my  $M$ . And this is nothing but  $\delta M$  by  $\delta x$ , which gives me shear force. Now again, we can make similar argument and we can say that these terms are 0 for our case because at  $x$  equal to 0, we have the axial displacement specified which is  $u_0$ , which means that delta of  $u_0$  is 0. At the other end the normal force is 0.

Similarly, here we have the slope  $\delta w$  by  $\delta x$  specified, which means the variation of the slope is 0 at this end. And at  $x$  equal to  $L$ , we do not have the bending moment. So, the bending moment is 0 at  $x$  equal to  $L$ . And at  $x$  equal to 0, we have the displacement

specified. So,  $\delta w$  is 0 here and at  $x$  equal to  $L$ , we do not have any shear force. So, that helps me get rid of all these terms and we are left with only this and this. And again, we know that  $\delta u_0$  and  $\delta w$  are independent and arbitrary variation, which tells me that these integrands must be individually 0.

(Refer Slide Time: 10:43)

$$\begin{aligned}
 & - \int_0^L \left( \frac{\partial}{\partial x} \left( EA_{tot} \frac{\partial u_0}{\partial x} \right) + \frac{\partial}{\partial x} \left( ES_{tot} \frac{\partial^2 w}{\partial x^2} \right) - \frac{\partial N_p}{\partial x} + p_x \right) \delta u_0 dx \quad \checkmark \\
 & + \int_0^L \left( \frac{\partial^2}{\partial x^2} \left( ES_{tot} \frac{\partial u_0}{\partial x} \right) + \frac{\partial^2}{\partial x^2} \left( EI_{tot} \frac{\partial^2 w}{\partial x^2} \right) - \frac{\partial^2 M_p}{\partial x^2} - p_z \right) \delta w dx \quad \checkmark \\
 & + \left[ \left( EA_{tot} \frac{\partial u_0}{\partial x} + ES_{tot} \frac{\partial^2 w}{\partial x^2} - N_p \right) \delta u_0 \right]_0^L \quad \checkmark \quad EA \frac{\partial u_0}{\partial x} + ES_{tot} \frac{\partial^2 w}{\partial x^2} - N_p - N = 0 \\
 & + \left[ \left( ES_{tot} \frac{\partial u_0}{\partial x} + EI_{tot} \frac{\partial^2 w}{\partial x^2} - M_p \right) \delta \left( \frac{\partial w}{\partial x} \right) \right]_0^L \quad \checkmark \\
 & - \left[ \left( \frac{\partial}{\partial x} \left( ES_{tot} \frac{\partial u_0}{\partial x} \right) + \frac{\partial}{\partial x} \left( EI_{tot} \frac{\partial^2 w}{\partial x^2} \right) - \left( \frac{\partial M_p}{\partial x} \right) \right) \delta w \right]_0^L = 0 \quad \checkmark
 \end{aligned}$$

Smart Structure

And from that same argument we can say that this is our one governing differential equation, and this is our other governing differential equation. So, we get the governing differential equations in a different form. Now, if I compare this form with our previous form, the difference is that while getting the previous form, we did integration by parts in these terms where  $N_p$  and  $M_p$  were present, sorry, where  $P_x$  and  $P_z$  were present whereas, here we did integration by parts in the other terms. And there, it was written in terms of variation of  $\epsilon_0$  and  $\kappa$ . Here it is written in terms of  $u_0$  and  $w$ . And from there, we get these two equations. Now, we will see using these two equations, how we can get the solution to the problem.

(Refer Slide Time: 11:46)

$$\frac{\partial}{\partial x} \left( EA_{tot} \frac{\partial u_0}{\partial x} \right) + \frac{\partial}{\partial x} \left( ES_{tot} \frac{\partial^2 w}{\partial x^2} \right) - \frac{\partial N_p}{\partial x} + p_x = 0$$

$$\frac{\partial^2}{\partial x^2} \left( ES_{tot} \frac{\partial u_0}{\partial x} \right) + \frac{\partial^2}{\partial x^2} \left( EI_{tot} \frac{\partial^2 w}{\partial x^2} \right) - \frac{\partial^2 M_p}{\partial x^2} - p_z = 0$$

*Smart Structure*

Now, these two equations are now written in a compact form as this. So, where we have this operator. So,  $u_0$  comes here, and it gets operated here,  $w$  comes here and it gets operated here and we get the first equation. Similarly,  $u_0$  comes here and  $w$  comes here and we get the second equation. We are going to solve it by using a technique named the Galerkin technique.

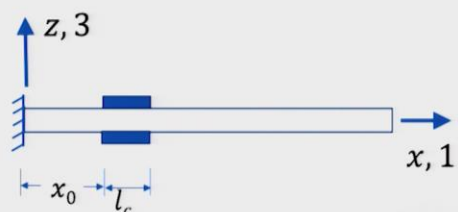

(Refer Slide Time: 12:24)

Galerkin Method

$$\begin{bmatrix} \frac{\partial}{\partial x} \left( EA_{tot} \frac{\partial}{\partial x} \right) & \frac{\partial}{\partial x} \left( ES_{tot} \frac{\partial^2}{\partial x^2} \right) \\ \frac{\partial^2}{\partial x^2} \left( ES_{tot} \frac{\partial}{\partial x} \right) & \frac{\partial^2}{\partial x^2} \left( EI_{tot} \frac{\partial^2}{\partial x^2} \right) \end{bmatrix} \begin{Bmatrix} u_0 \\ w \end{Bmatrix} - \begin{Bmatrix} \frac{\partial N_p}{\partial x} \\ \frac{\partial^2 M_p}{\partial x^2} \end{Bmatrix} = \begin{Bmatrix} -p_x \\ p_z \end{Bmatrix}$$

*Smart Structure*

So, let us apply the technique. Again, let us assume that we have  $u_0$  as this. So,  $u_0$  is written as a combination of this product and within this product, we have  $\phi$  and  $q$ . So,  $\phi_{u_i}$  is chosen function, chosen function to approximate  $u_0$  and similarly  $\phi_{w_j}$  is chosen to approximate  $w$ . If we can choose in such a way that they satisfy both essential and natural boundary conditions, I mean the geometric and force boundary conditions, that is good, but at the bare minimum they should satisfy the essential boundary conditions. So, these  $\phi$ 's are all known to us, because we are choosing them and they are being multiplied with unknown constants  $q_{u_i}$  and this  $q_{w_j}$ . Now,  $q_{u_i}$ ,  $q_{w_j}$  are unknowns to be found out. Now, we have assumed that our  $u_0$  has this  $m$  number of terms and  $w$  has this  $n$  number of terms.

So, the vector  $q_u$  ranges from 1 to  $m$  and the size of the vector  $q_w$  is  $n$ . Now, we can write a vector  $u$  which has  $u_0$  and  $w$ . And then, we can write it in terms of this  $\phi$ 's and this  $q$ 's as this. Here we have first  $m$  terms, which is populated with this  $q_u$ 's and then rest of the  $n$  terms are 0. And here, we have first  $m$  term 0 and then rest of the  $n$  terms populated with this  $q_w$ 's. So, this is of size 2 multiplied by  $m$  plus  $n$ . And this is of size  $m$  plus  $n$  multiplied by 1. Now, we can call this entire vector as one  $q$  vector with size  $m$  plus  $n$ . So, within this  $q$  vector the first  $m$  number of  $q$ 's are  $q_u$ 's and rest of the  $n$  number of  $q$ 's are  $q_w$ 's and it is multiplied with the same thing. So, in a compact way we can call this as  $\phi$  matrix multiplied by  $q$  matrix. So, this is our  $\phi$  matrix and this is our  $q$  vector.

(Refer Slide Time: 16:12)

The slide displays the following mathematical content:

$$U = \begin{Bmatrix} u_0 \\ w \end{Bmatrix} = \begin{bmatrix} \phi_{u_1} & \phi_{u_2} & \dots & \phi_{u_M} & 0 & 0 & 0 \\ 0 & 0 & \dots & 0 & \phi_{w_1} & \phi_{w_2} & \dots & \phi_{w_N} \end{bmatrix} \begin{Bmatrix} q_{u_1} \\ \vdots \\ q_{u_M} \\ q_{w_1} \\ \vdots \\ q_{w_N} \end{Bmatrix}$$

Dimensions are noted as  $2 \times (M+N)$  for the matrix and  $(M+N) \times 1$  for the vector.

$$u_0(x) = \sum_{i=1}^M \phi_{u_i}(x) q_{u_i} = \sum_{i=1}^M \phi_{u_i}(x) q_i$$

$$w(x) = \sum_{j=1}^N \phi_{w_j}(x) q_{w_j} = \sum_{j=1}^N \phi_{w_j}(x) q_{j+M}$$

Handwritten notes in red:

- $\phi_{u_i}(x) \rightarrow$  chosen function to approximate  $u_0$
- $\phi_{w_j}(x)$  is chosen to approximate  $w$
- $q_{u_i}, q_{w_j}$  are unknowns to be found out

The matrix is labeled  $[\Phi]$  and the vector is labeled  $\{q\}$ . The equation is summarized as  $U = \Phi(x)q$ .

So, again the governing equation rewritten here. So, if we put the approximations of  $u_0$  and  $w$  so, that becomes our  $\phi$  multiplied by  $q$ . Now, because they are approximations, they may not be exact with  $u_0$  and  $w$ . So, if I take the right-hand side to the left-hand side, and if we substitute  $u_0$   $w$  vector as  $q$  as  $\phi q$ , then we can say that, this entire thing may

not be exactly 0 because  $\phi q$  may not be exactly equal to  $u_0 w$ . So, there is can be some error which is remaining and that error is this. So, the close we are to the real value of  $u_0$  and  $w$  this is the error.

(Refer Slide Time: 17:11)

The beam equations are -

$$\begin{bmatrix} \frac{\partial}{\partial x} \left( EA_{tot} \frac{\partial}{\partial x} \right) & \frac{\partial}{\partial x} \left( ES_{tot} \frac{\partial^2}{\partial x^2} \right) \\ \frac{\partial^2}{\partial x^2} \left( ES_{tot} \frac{\partial}{\partial x} \right) & \frac{\partial^2}{\partial x^2} \left( EA_{tot} \frac{\partial^2}{\partial x^2} \right) \end{bmatrix} \begin{Bmatrix} u_0 \\ w \end{Bmatrix} - \begin{Bmatrix} \frac{\partial N_p}{\partial x} \\ \frac{\partial^2 M_p}{\partial x^2} \end{Bmatrix} = \begin{Bmatrix} -p_x \\ p_z \end{Bmatrix}$$

Error function -

$$e(x) = \begin{bmatrix} \frac{\partial}{\partial x} \left( EA_{tot} \frac{\partial}{\partial x} \right) & \frac{\partial}{\partial x} \left( ES_{tot} \frac{\partial^2}{\partial x^2} \right) \\ \frac{\partial^2}{\partial x^2} \left( ES_{tot} \frac{\partial}{\partial x} \right) & \frac{\partial^2}{\partial x^2} \left( EA_{tot} \frac{\partial^2}{\partial x^2} \right) \end{bmatrix} \Phi q - \begin{Bmatrix} \frac{\partial N_p}{\partial x} \\ \frac{\partial^2 M_p}{\partial x^2} \end{Bmatrix} = \begin{Bmatrix} -p_x \\ p_z \end{Bmatrix}$$

Smart Structure

Then what we do is: we multiply this error function by this approximation  $\phi$ 's and then, so, if we go back to our  $\phi$  vector. So, this is our  $\phi_1$ , this is our  $\phi_2$ , this is our  $\phi_3$   $\phi_m$  and so on and we can go up to  $\phi_n$ . So, we may say that, we may like to call this as our  $\phi_1$  vector and we can go on. So, this is our  $\phi_m$  vector and we may call each of them as a vector and we can say that, this  $\phi$  matrix consists of, this capital  $\phi$  matrix consists of all this small  $\phi$  vectors.

(Refer Slide Time: 18:40)

$$U = \begin{Bmatrix} u_0 \\ w \end{Bmatrix} = \begin{bmatrix} \phi_{u_1} & \phi_{u_2} & \dots & \phi_{u_M} & 0 & 0 & 0 \\ 0 & 0 & \dots & 0 & \phi_{w_1} & \phi_{w_2} & \dots & \phi_{w_N} \end{bmatrix} \begin{Bmatrix} q_{u_1} \\ \vdots \\ q_{u_M} \\ q_{w_1} \\ \vdots \\ q_{w_N} \end{Bmatrix}$$

2 x (M+N)

$$u_0(x) = \sum_{i=1}^M \phi_{u_i}(x) q_{u_i} = \sum_{i=1}^M \phi_{u_i}(x) q_i$$

$$w(x) = \sum_{j=1}^N \phi_{w_j}(x) q_{w_j} = \sum_{j=1}^N \phi_{w_j}(x) q_{j+M}$$

$$= \begin{bmatrix} \phi_{u_1} & \phi_{u_2} & \dots & \phi_{u_M} & 0 & 0 & \dots & 0 \\ 0 & 0 & \dots & 0 & \phi_{w_1} & \phi_{w_2} & \dots & \phi_{w_N} \end{bmatrix} \begin{Bmatrix} q_1 \\ q_2 \\ \vdots \\ q_{M+N} \end{Bmatrix} = \Phi(x) q$$

[Phi] = [ {phi}\_1, {phi}\_2, ..., {phi}\_{M+N} ]

$\phi_{u_i}(x)$  - chosen function to approximate  $u_0$   
 $\phi_{w_j}(x)$  is chosen to approximate  $w$   
 $q_{u_i}, q_{w_j}$  are unknowns to be found out

Now, in this error function, if I multiply the - what we are doing here, if I multiply the  $i$ th  $\phi$ , the transpose of that with the error function and then integrate from 0 to  $L$  and equate that to 0 and we can do it for all these  $\phi$ 's. So, that gives me total  $m$  plus  $n$  number of equations. And those  $m$  plus  $n$  number of equations would have these  $q$ 's as the unknowns and that will give me. So, it will give me  $m$  plus  $n$  number of equations with  $m$  plus  $n$  number of unknowns and that can be written in a matrix form as this. Now, this we call stiffness matrix and this we call force vector. In the stiffness matrix, the generalized  $i$ th component can be written as this. So, the so  $k_{ij}$  is equal to  $\phi_i$  multiplied by this matrix multiplied by  $\phi_j$ . So, we know that it is 1 by 2 because the  $i$ th column of  $\phi$  is 2 by 1, and similarly this is 2 by 1 and this is 2 by 2.

So, after this multiplication this gives me one value the  $ij$ th value of the  $K$ th matrix. Let us assume that our  $\phi_j$ , let us assume that, we are taking from our  $\phi$  matrix, we are taking this as  $i$  and this as  $j$ . So, let us assume that  $i$  is equal to 1 and  $j$  is equal to 2. So, in this case, it would look like this:  $\phi_{u_1} 0$  multiplied by this vector  $\Delta$  by  $\Delta x$ ,  $E A$  total  $\Delta$  by  $\Delta x$ , and then, we have this  $\phi_{u_1}$  and 0. So, when I multiply this column with this  $\rho$ , I have  $\Delta \Delta x$  of  $E A$  total,  $\Delta \phi_1 \Delta x$ , plus 0. And here, I have  $\Delta^2 \Delta x$  of  $E S$  total,  $\Delta \phi_1 \Delta x$  as 0. So, as we said, let us assume  $i$  is equal to 1  $j$  is equal to 2. So, it is 2. So that gives me  $\phi_{u_1} 0$ , and here, we have  $\Delta \Delta x$  of  $E A$  total,  $\Delta \phi_{u_1}$  by  $\Delta x$ . And here, we have  $\Delta^2$  by  $\Delta x$   $E A$  total,  $\Delta \phi_{u_2}$  by  $\Delta x$ . And of course, this has to be integrated from 0 to  $L$ . This also has to be integrated from 0 to  $L$ . Again, we multiply this  $\rho$  with this vector and after we multiply, we are remaining with only one term. So, this term multiplied with by this term, that will give me just one value. This multiplied by 0 will give me 0. So, finally, we will get 1 by 1 term which is our  $k_{ij}$ . So, in

this particular case, which is k 12. So, accordingly we can just put any i here and any j here, and accordingly, we will get the k ij and this entire matrix will be populated.

(Refer Slide Time: 23:53)

From method of weighted residual -

$$\int_0^L \phi_i^T e(x) dx = 0 \quad \text{for } i = 1, 2, \dots, M + N$$

Solution of the above equation in matrix form (M+N number of equations) as -

**Kq = F**

The generalized stiffness matrix are -

$$K_{ij} = \int_0^L \phi_i^T \begin{bmatrix} \frac{\partial}{\partial x} \left( EA_{tot} \frac{\partial}{\partial x} \right) & \frac{\partial}{\partial x} \left( ES_{tot} \frac{\partial^2}{\partial x^2} \right) \\ \frac{\partial^2}{\partial x^2} \left( ES_{tot} \frac{\partial}{\partial x} \right) & \frac{\partial^2}{\partial x^2} \left( EA_{tot} \frac{\partial^2}{\partial x^2} \right) \end{bmatrix} \phi_j dx$$

*Handwritten notes:*

Assume  $i=1, j=2$

$$\int_0^L \begin{Bmatrix} \phi_{u1} \\ 0 \end{Bmatrix} \begin{bmatrix} \frac{\partial}{\partial x} (EA_{tot} \frac{\partial}{\partial x}) & \frac{\partial}{\partial x} (ES_{tot} \frac{\partial^2}{\partial x^2}) \\ \frac{\partial^2}{\partial x^2} (ES_{tot} \frac{\partial}{\partial x}) & \frac{\partial^2}{\partial x^2} (EA_{tot} \frac{\partial^2}{\partial x^2}) \end{bmatrix} \begin{Bmatrix} \phi_{u2} \\ 0 \end{Bmatrix} dx$$

$$\Rightarrow \int_0^L \begin{Bmatrix} \phi_{u1} \\ 0 \end{Bmatrix} \begin{Bmatrix} \frac{\partial}{\partial x} (EA_{tot} \frac{\partial \phi_{u2}}{\partial x}) \\ \frac{\partial^2}{\partial x^2} (ES_{tot} \frac{\partial \phi_{u2}}{\partial x}) \end{Bmatrix} dx$$

*Dimensions:*  $1 \times 2$  (matrix),  $2 \times 1$  (matrix),  $2 \times 2$  (matrix)

Similarly, when I find out phi I, this becomes the expression. So, phi i is multiplied with del Np by del x, and del 2 Mp by del x 2, and then we have phi i transpose. So, here also we have phi i transpose and here also we have phi i transpose multiplied with minus Px, Pz vector. Now, generally while evaluating this, we don't directly evaluate this, we shift the derivatives here also by integrating by parts and then we see that the boundary terms go 0 and the rest of the integral evaluated. So, instead of the differentiation being here, we get the differentiation here and we evaluate. So, later on when we do an example, we will see it in more details, how the derivative is shifted and how this term is evaluated in a better way.

So, with this we get the k matrix and the force vector and by solving we get our q. And once we, and once we get our q. So, we have q u, we have q w's. So, we get q ui, q wj from here, and then we put it back in our approximation that u0, as a function of u is summation of phi ui into q ui, and w as a function of x is equal to phi wj into q wj. So, we just put it here, and we put it here, and that gives us the desired solution. So, we get our solution. So, that is one way to solve these differential equations.

(Refer Slide Time: 25:53)

The generalized forcing vectors are –

$$F_i = \int_0^L \phi_i^T \begin{Bmatrix} \frac{\partial N_p}{\partial x} \\ \frac{\partial^2 M_p}{\partial x^2} \end{Bmatrix} dx + \int_0^L \phi_i^T \begin{Bmatrix} -p_x \\ p_z \end{Bmatrix} dx$$

$[K]\{z\} = \{F\}$   
 $z_{u_i}$  →  $u_0(x) = \sum \phi_{u_i} z_{u_i}$   
 $z_{w_j}$  →  $w(x) = \sum \phi_{w_j} z_{w_j}$   
 solution

So, here we started with the differential equation and then, we multiplied them by each of these approximation functions and finally, this differential equation was converted to a set of algebraic equations. And then by solving the algebraic equations, we get our solution.

So, with this I would conclude it here. We will look into some other similar techniques in the next lecture.

Thank you.
