**Analysis of composite laminate with piezoelectric patches(continued)**  
**Part 04**

Today, we will continue our discussion on Analysis of Composite Laminates which has piezoelectric patches.

In the previous lecture, we saw a case where the deformation was purely in plane, it was because our actuators were actuated in such a way that it generates only in plane force and also the composite laminate was symmetric.

Now, today we will see a pure bending case. Now again the structure is same, we have a composite laminate and the laminate is symmetric, dimensions are same, this is our x axis, this is y. So, this dimension is L and this is c by 2 and this is c by 2 and it is fixed at one end. And if we look at the view along the x z plane, it looks like this.

So, it has a piezoelectric patch and again we can assume that it is throughout, but that does not matter even if we keep it at a small part of it, the analysis remains same. So, let us assume that our thickness of the laminate is  $t_b$  and thickness of the two patches are  $t_c$  and the laminate is symmetric. So, this is the differential equation that ordinary differential equation, that we derived considering the Rayleigh-Ritz technique. So, we are solving it using Rayleigh-Ritz method.

$$[M_{II}]\{\ddot{q}_I\} + [M_{IW}]\{\ddot{q}_W\} + [K_{II}]\{q_I\} + [K_{IW}]\{q_W\} = \{F_I\}$$

$$[M_{WI}]\{\ddot{q}_I\} + [M_{WW}]\{\ddot{q}_W\} + [K_{WI}]\{q_I\} + [K_{WW}]\{q_W\} = \{F_W\}$$

Now, within this differential equation ah these terms are 0, these terms do not come into picture because this is 0 because it is a static problem. The actuation is static. So, there is no acceleration and  $K_I$ ,  $K_I$ ,  $K_{IW}$  equal to  $K_{IW}$  equal to 0 as before since B matrix is 0, symmetric laminate. So, we are left with only this equation. So, these two equations i.e., the first equation and the second equation can be solved separately.

Now, in this case the actuation is purely a bending actuation. So, we need to solve only the only this equation. So, solve  $K_{WW} q_W$  is equal to  $F_w$ . So, now as before we need to make some approximations. So, let us go to next slide.

(Refer Slide Time: 4:00)

Pure Bending  
Rayleigh Ritz Method

$$[M_{zz}] \{\ddot{q}_z\} + [M_{zw}] \{\ddot{q}_w\} + [K_{zz}] \{q_z\} + [K_{zw}] \{q_w\} = \{F_z\}$$

$$[M_{wz}] \{\ddot{q}_z\} + [M_{ww}] \{\ddot{q}_w\} + [K_{wz}] \{q_z\} + [K_{ww}] \{q_w\} = \{F_w\}$$

static problem

$$[K_{zw}] = [K_{wz}] = [0]$$

since [B] = [0]  
symmetric laminate

solve  $[K_{ww}] \{q_w\} = \{F_w\}$

Our approximation was a function of  $x, y$  is the approximation that we make is as  $x^2$  by  $1$  square multiplied by  $q_{w1}$ . So, this is we can call it  $\phi_{w1}$  and this is our this is  $q_{w1}$ .

$$w(x, y) = \frac{x^2}{l^2} q_{w1}$$

Now, this satisfies the essential boundary condition. So, at  $x$  equal to  $0$ ,  $w$  is  $0$  and at  $x$  equal to  $0$   $dw$  by  $dx$  is equal to  $0$ . So, the cantilever boundary condition is satisfied slope and displacements at  $x$  equal to  $0$  is  $0$ .

Now, we need to find out our  $K_{ww}$ . So,  $K$  we are just writing it as  $K$  because other components of  $K$  are not there anymore and to do that, we have the expression as  $B_w$  transpose, multiplied by the  $D$  matrix, multiplied by  $B_w$  and it is integral. Now, we need to find out this  $B_w$  transpose and to find out the  $B_w$  transpose, we need our quantities like  $\kappa$ .

$$K = \int_{\Omega} [B_w]^T [D] [B_w] d\Omega$$

So,  $\kappa$  as we know is  $\frac{\partial^2 w}{\partial x^2}$  this is  $\frac{\partial^2 w}{\partial y^2}$  and this is  $2 \frac{\partial^2 w}{\partial x \partial y}$  and as per the approximation, this can be written as  $\frac{\partial^2 \phi_{w1}}{\partial x^2}$ . This quantity is  $0$  because  $\phi$  is a function of only  $x$ . So, again it is a very simplified approximation. We are assuming that the bending i.e., the  $w$  is function of only  $x$ . So, bending is with respect to only the  $y$  axis. And this quantity is  $0$  and this quantity is  $0$ . And this is equal to  $q_{w1}$ . And also,  $\frac{\partial^2 \phi_{w1}}{\partial x^2}$  is: if I just differentiate it twice, it becomes  $2$  by  $l^2$ . And this is our  $B_w$  matrix we can say.

$$K = \begin{Bmatrix} \frac{\partial^2 w}{\partial x^2} \\ \frac{\partial^2 w}{\partial y^2} \\ 2 \frac{\partial^2 w}{\partial x \partial y} \end{Bmatrix} = \begin{Bmatrix} \frac{\partial^2 \phi_{wI}}{\partial x^2} \\ 0 \\ 0 \end{Bmatrix} = \begin{Bmatrix} \frac{2}{l^2} \\ 0 \\ 0 \end{Bmatrix}$$

And also, we need the  $M_P$ 's and  $M_P$ 's have only one component and which is this. Again, that is an approximation. So, we have only one component of  $M_P$  which is  $M_{PX}$  and 0 0. And we know how to find out  $M_{XP}$ , we have done it before.

$$M_P = \begin{Bmatrix} M_{PX} \\ 0 \\ 0 \end{Bmatrix}$$

So, finally, if we put everything in this expression this becomes an integral over x and y 0 0. And then, we have D matrix here and here we have 0 0. Let us write this as an integral from x and y. So, this quantity reduces to  $\frac{\partial^2 \phi_{wI}}{\partial x^2}$  by  $\frac{\partial^2 \phi_{wI}}{\partial x^2}$ ,  $D_{11}$ ,  $\frac{\partial^2 \phi_{wI}}{\partial x^2}$ ,  $\frac{\partial^2 \phi_{wI}}{\partial x^2}$  dx dy. And finally, on being integrated, this gives us 4 c. So, this is  $D_{XX}$  generally as per our convention. So, this D matrix many a times we write it as  $D_{11}$ ,  $D_{12}$ , I mean all these A B or D matrix, sometimes we write it from write it as  $A_{11}$   $A_{12}$   $A_{16}$  or we can write it as  $D_{XX}$   $D_{XY}$  and  $D_{XS}$ . So, some books you will find out these subscripts to be 12 or 6 and in some of the books you may find it to be x y or s and both are same.

$$K_{11} = \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial^2 \phi_{wI}}{\partial x^2} \quad 0 \quad 0 \right\} [D] \begin{Bmatrix} \frac{\partial^2 \phi_{wI}}{\partial x^2} \\ 0 \\ 0 \end{Bmatrix} dx dy$$

$$K_{11} = \int_{-c/2}^{c/2} \int_0^l \frac{\partial^2 \phi_{wI}}{\partial x^2} [D] \frac{\partial^2 \phi_{wI}}{\partial x^2} dx dy$$

$$K_{11} = \frac{4CD_{XX}}{l^3}$$

So, this is our expression for K and K has only one component. So, let's call it  $K_{11}$ .

Now we have to find out the right-hand side the force term which comes due to the piezoelectric actuation. Now, just to note one thing this we are we have been calling  $M_{PX}$  not  $M_{XP}$  same thing.

(Refer Slide Time: 10:00)

$w(x,y) = \frac{x^2}{l^2} q_{w1}$  at  $x=0$   $w=0$   
 $x=l$   $\frac{dw}{dx} = 0$

$K_{11} = \int [B_w]^T [D] [B_w] d\Omega$

$= \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial^2 \phi_{w1}}{\partial x^2} \ 0 \ 0 \right\} [D] \begin{Bmatrix} \frac{\partial^2 \phi_{w1}}{\partial x^2} \\ 0 \\ 0 \end{Bmatrix} dx dy$

$= \int_{-c/2}^{c/2} \int_0^l \frac{\partial^2 \phi_{w1}}{\partial x^2} D_{xx} \frac{\partial^2 \phi_{w1}}{\partial x^2} dx dy$

$= \frac{4cD_{xx}}{l^3}$

$K = \begin{Bmatrix} \frac{\partial^2 w}{\partial x^2} \\ \frac{\partial w}{\partial y} \\ 2 \frac{\partial^2 w}{\partial x \partial y} \end{Bmatrix} = \begin{Bmatrix} \frac{\partial^2 \phi_{w1}}{\partial x^2} \\ 0 \\ 0 \end{Bmatrix} q_{w1}$

$M_p = \begin{Bmatrix} M_{px} \\ 0 \\ 0 \end{Bmatrix}$

*Smart Structure*

Now, we have to find out the force term. So, we have  $F_P$  is equal to minus  $c$  by  $2$ ,  $c$  by  $2$ ,  $0$  to  $1$  and then we have  $\frac{\partial^2 \phi_{w1}}{\partial x^2}$  by  $\frac{\partial x^2}{\partial x^2}$   $0$   $0$ . And this is multiplied with this vector  $M_{PX}$   $0$   $0$  and we have this.

$$F_P = \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial^2 \phi_{w1}}{\partial x^2} \ 0 \ 0 \right\} \begin{Bmatrix} M_{PX} \\ 0 \\ 0 \end{Bmatrix} dx dy$$

So, finally, this turns out to be this.

$$F_P = \int_{-c/2}^{c/2} \int_0^l M_{PX} \frac{\partial^2 \phi_{w1}}{\partial x^2} dx dy = \frac{2M_{PX}c}{l}$$

And then on being integrated the value comes to be  $2 M_{PX} c$  by  $L$ , and then we can solve the equation and  $q_{w1}$  can come to. So, this is again it has only one component let us call it  $F_{P1}$  by  $K_{11}$  and that gives me  $q_{w1}$  to be  $M_{PX}$ ,  $1$  square by  $2 D_{XX}$ . So, this is our  $q_{w1}$  and then we can substitute  $q_{w1}$  to the original approximation and that gives us  $w$  as a function of  $x$ .

$$q_{w1} = \frac{F_{P1}}{K_{11}} = \frac{M_{PX}l^2}{2D_{XX}}$$

Now, we will solve this similar problem using the Galerkin technique.

(Refer Slide Time: 11:47)

$$F_{P2} = \int_{-c/2}^{c/2} \int_0^L \left\{ \frac{\partial^2 \phi_{w1}}{\partial x^2} \quad 0 \quad 0 \right\} \begin{Bmatrix} M_{P2} \\ 0 \\ 0 \end{Bmatrix} dx dy$$

$$= \int_{-c/2}^{c/2} \int_0^L M_{P2} \frac{\partial^2 \phi_{w1}}{\partial x^2} dx dy = \frac{2 M_{P2} c}{L}$$

$$q_{w1} = \frac{F_{P1}}{K_{11}} = \frac{M_{P2} L^2}{2 D_{xx}}$$

To do it using Galerkin technique, we need to again make a different approximation because in Galerkin technique when we are having a purely bending problem, the highest order derivative appearing is 4. So, accordingly the approximation has to be changed. So, let us approximate  $w$  as  $6x$  by  $l$  square, minus  $4x$  by  $l$  cube, plus  $x$  by  $l$  to the power 4 multiplied by  $q_{w1}$ . So, this is our approximation now. So, this is our  $\phi_{w1}$ . Now this satisfies both essential and natural boundary condition which means the geometric and force boundary conditions.

$$w(x, y) = \left[ 6 \left( \frac{x}{l} \right)^2 - 4 \left( \frac{x}{l} \right)^3 + \left( \frac{x}{l} \right)^4 \right] q_{w1}$$

So, satisfies geometric and force boundary conditions. So, those conditions are  $w$  at  $y$  is 0, now  $\frac{\partial w}{\partial x}$  at  $x$  equal to 0 is 0. And then we have  $\frac{\partial^2 w}{\partial x^2}$ , it is a cantilever beam. So, at  $x$  equal to  $l$  is 0 and then we have  $\frac{\partial^3 w}{\partial x^3}$  at  $x$  equal to  $l$  is 0. It has the derivatives up to fourth order existing. So, we need to make sure that minimum fourth order derivative exists because that is that is the highest order of derivative that would appear in our equation.

$$w(0, y) = 0 \quad \left. \frac{\partial^2 w}{\partial x^2} \right|_{x=l} = 0$$

$$\left. \frac{\partial w}{\partial x} \right|_{x=0} = 0 \quad \left. \frac{\partial^3 w}{\partial x^3} \right|_{x=l} = 0$$

So, the equation is  $D_{xx} \frac{\partial^4 w}{\partial x^4} = \frac{\partial^2 M_{P2}}{\partial x^2}$ .

$$D_{XX} \frac{\partial^4 w}{\partial x^4} = \frac{\partial^2 M_{PX}}{\partial x^2}$$

And then, we define an error as we have been doing and the error is  $D_{XX}$  multiplied by the fourth order derivative of  $w$  with respect to  $x$  minus this.

$$\epsilon = D_{XX} \frac{\partial^4 w}{\partial x^4} - \frac{\partial^2 M_{PX}}{\partial x^2}$$

And then we say that we have to multiply this error with  $\phi_{w1}$  and on being integrated over the domain that should be 0. So, let us do that. Now we multiply  $\phi_{w1}$  minus  $\partial^2 M_{PX}$  by  $\partial x^2 dx dy$  is equal to 0. So, this quantity would give us a term where I have  $q_{w1}$  and this would give us a pure force term and by solving that we can find out our  $q_{w1}$ .

$$\int_{-c/2}^{c/2} \int_0^l \phi_{w1} \left( D_{XX} \frac{\partial^4 w}{\partial x^4} - \frac{\partial^2 M_{PX}}{\partial x^2} \right) dx dy = 0$$

So, if these entire expressions are evaluated finally,  $q_{w1}$  comes to be 5 by 36 multiplied by  $M_{PX} l^2$  square by  $D_{XX}$ .

$$q_{w1} = \frac{5}{36} \left( \frac{M_{PX} l^2}{D_{XX}} \right)$$

And then it can be put in the original approximation and our solution is done.

(Refer Slide Time: 16:23)

Galerkin Technique

$$w(x,y) = \left[ 6 \left( \frac{x}{L} \right)^2 - 4 \left( \frac{x}{L} \right)^3 + \left( \frac{x}{L} \right)^4 \right] q_{w1}$$

↓  
 $\phi_{w1}$

satisfies geometric and force boundary conditions

$$w(0,y) = 0 \quad \left. \frac{\partial w}{\partial x} \right|_{x=L} = 0$$

$$\left. \frac{\partial w}{\partial x} \right|_{x=0} = 0 \quad \left. \frac{\partial^2 w}{\partial x^2} \right|_{x=L} = 0$$

$$D_{xx} \frac{\partial^4 w}{\partial x^4} = \frac{\partial^2 M_{PX}}{\partial x^2} \quad \epsilon = D_{xx} \frac{\partial^4 w}{\partial x^4} - \frac{\partial^2 M_{PX}}{\partial x^2}$$

$$\int_{-c/2}^{c/2} \int_0^l \phi_{w1} \left( D_{xx} \frac{\partial^4 w}{\partial x^4} - \frac{\partial^2 M_{PX}}{\partial x^2} \right) dx dy = 0$$

$$\Rightarrow q_{w1} = \frac{5}{36} \frac{M_{PX} l^2}{D_{xx}}$$

Smart Structure

Now, we will solve another problem where we have an anti-symmetric laminate.

Now, we know that, in an anti-symmetric laminate our B matrix is: so, with this anti-symmetric laminate is angle ply. It is not a cross ply. Because depending on whether the anti-laminate is angle ply or cross ply our B matrix changes. So, this is  $B_{XS}$  this is 0,  $B_{YS}$ , this is  $B_{XS}$   $B_{YS}$  0.

$$[B] = \begin{bmatrix} 0 & 0 & B_{XS} \\ 0 & 0 & B_{YS} \\ B_{XS} & B_{YS} & 0 \end{bmatrix}$$

And then we have A matrix and we know that for any balanced laminate, our A matrix has  $A_{XS}$  as 0, 0 0 0,  $A_{SS}$ .

$$[B] = \begin{bmatrix} A_{XX} & A_{XY} & 0 \\ A_{XY} & A_{YY} & 0 \\ 0 & 0 & A_{SS} \end{bmatrix}$$

And then we have D matrix and because this laminate is anti-symmetric. So, our  $D_{XS}$   $D_{YS}$  are also 0, 0 0  $D_{SS}$ .

$$[D] = \begin{bmatrix} D_{XX} & D_{XY} & 0 \\ D_{XY} & D_{YY} & 0 \\ 0 & 0 & D_{SS} \end{bmatrix}$$

And again, our structural details remain the same. We have a plate laminate which has a dimension of  $l$  along the x-axis and a dimension of  $c$  along the y-axis. And if we look at the x-z plane again, we have piezoelectric patches at the top and bottom and the patches are of the same property. Both material and geometric properties are the same.

So, this is  $t_b$  this is  $t_c$  and this is our x-axis, this is z-axis. Now, in this laminate, the piezoelectric patches which are put here, if they are actuated even in the in-plane mode, suppose I give the same voltage at the top and bottom, then also it would induce some out-of-plane deformation because our B matrix is non-zero. So, now because in the B matrix, we have  $B_{XS}$  and  $B_{YS}$  present. So, it's basically a coupling between the in-plane deformation and the twisting. Now, please understand that  $B_{XS}$ ,  $B_{XY}$  and  $B_{YY}$  are 0 and that is why any in-plane loading, any in-plane actuation is not going to cause any bending, but it would be going to cause twisting. So, here twisting and in-plane deformations are coupled.

Now, there is no coupling between bending and twisting, but there is a coupling between in-plane normal strain components and torsional strain. So, we need to approximate both  $u$  and  $w$  and solve it accordingly. So, now let us make some approximation. So, assume  $u_0$  as a function of  $x$  and  $y$  is the approximation that we take is  $x$  by  $l$ ,  $q_{u1}$ .

So, this is our  $\phi_{u1}$ , and for  $w$ , let us make the approximation to be  $x$  square  $y$  by  $l$  square  $c$ ,  $q_{w1}$ . And this is called  $\phi_{w1}$ . And we have  $v_0$  as 0.

$$u_0(x, y) = \frac{x}{l} q_{u1} \quad w(x, y) = \frac{x^2 y}{l^2 c} q_{w1}$$

Now in our approximation for  $w$ , we took a  $y$  component also because we expect a twisting to be induced that is why we do not have a purely  $x$  component, I mean,  $w$   $x$   $y$  is not just a function of  $x$  it is a function of  $y$  as well. And  $u_0$  is function of  $x$  only. Now all we need to do is we need to solve that solve two equations. So, finally, in this case the equation would look like this.

We will have  $K_{IW}$  multiplied by  $q_I$  plane plus: we just wrote the equation in the, ok. So, we have to solve two equations here. We have  $K_{II}$  multiplied by  $q_I$  which we call in plane plus  $K_{IW}$  multiplied by  $q_w$  is equal to  $F_I$ . And here we have  $K_{WI}$  multiplied by  $q_I$  plus  $K_{WW}$  multiplied by  $q_w$  is equal to  $F_w$ . So, we have to solve these two equations. So, we need to evaluate these matrices.

$$[K_{II}]\{q_I\} + [K_{IW}]\{q_w\} = \{F_I\}$$

$$[K_{WI}]\{q_I\} + [K_{WW}]\{q_w\} = \{F_w\}$$

(Refer Slide Time: 23:36)

Antisymmetric Laminate (Angle  $\phi_1$ )

$$[B] = \begin{bmatrix} 0 & 0 & B_{25} \\ 0 & 0 & B_{35} \\ B_{25} & B_{35} & 0 \end{bmatrix}$$

$$[A] = \begin{bmatrix} A_{xx} & A_{xy} & 0 \\ A_{xy} & A_{yy} & 0 \\ 0 & 0 & A_{ss} \end{bmatrix} \quad [D] = \begin{bmatrix} D_{xx} & D_{xy} & 0 \\ D_{xy} & D_{yy} & 0 \\ 0 & 0 & D_{ss} \end{bmatrix}$$

Assume  $u_0(x, y) = \frac{x}{l} q_{u1}$       $w(x, y) = \frac{x^2 y}{l^2 c} q_{w1}$

$v_0 = 0$

$$[K_{II}]\{q_I\} + [K_{IW}]\{q_w\} = \{F_I\}$$

$$[K_{WI}]\{q_I\} + [K_{WW}]\{q_w\} = \{F_w\}$$

So, finally, this entire thing looks like this if we write it in the, I mean, as per their expressions. So, this is  $B_1^T$  multiplied by  $A$  matrix, multiplied by  $B_1^T$  transpose  $dx$   $dy$  and we have  $q_{u1}$  plus minus  $c$  by  $2$ ,  $c$  by  $2$ ,  $0$  to  $L$ , then we have  $B_1^T$  multiplied by the  $B$  matrix,

multiplied by  $B_w$  (transpose should not be there) and then we have  $dx dy$ . And finally, at the right-hand side we have this is multiplied by  $q_{w1}$  and at the right-hand side we have minus  $c$  by  $2$ ,  $c$  by  $2$ ,  $0$  to  $1$ . And then we have  $B_1$  transpose into  $N_P dx dy$ .

$$\begin{aligned} & \int_{-c/2}^{c/2} \int_0^l [B_I]^T [A] [B_I] dx dy q_{u1} + \int_{-c/2}^{c/2} \int_0^l [B_I]^T [B] [B_W] dx dy q_{w1} \\ &= \int_{-c/2}^{c/2} \int_0^l [B_I]^T \{N_P\} dx dy \end{aligned}$$

So, again if we follow the same procedure, this comes to be minus  $c$  by  $2$ ,  $c$  by  $2$ ,  $0$  to  $1$ . And then, we have  $\text{del } \phi_{u1}$  by  $\text{del } x$ ,  $0$   $0$ . And we have the  $A$  matrix here and this becomes  $\text{del } \phi_{u1}$  by  $\text{del } x$ ,  $0$   $0$   $dx dy$ ,  $q_{u1}$  plus we have same thing  $\text{del } \phi_{u1}$  by  $\text{del } x$ ,  $0$   $0$  and here we have the  $B$  matrix and here we have  $\text{del } 2 \phi_{w1}$   $\text{del } x$ ,  $2$ ,  $0$  twice of  $\text{del } 2 \phi_{w1}$   $\text{del } x$   $\text{del } y$ . Now please understand if we look at the ah approximations for  $w$  this  $\phi_{w1}$ , if we differentiate it twice with respect to  $x$  there is a non zero derivative. If we differentiate it twice with respect to  $y$  there is a zero derivative. And if we differentiate it with respect to  $x$  once and  $y$  once again there is a non-zero derivative. So, that is why the middle term is  $0$  and the other two terms are non-zero.  $dx dy$ . And this is multiplied by  $q_{w1}$  minus  $c$  by  $2$ ,  $c$  by  $2$ ,  $0$  to  $1$ . And this quantity is  $\text{del } \phi_{u1}$  by  $\text{del } x$ ,  $0$   $0$ . Here we have  $N_{PX}$   $0$   $0$  and  $dx dy$ .

$$\begin{aligned} & \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial \phi_{u1}}{\partial x} \quad 0 \quad 0 \right\} [A] \left\{ \begin{matrix} \frac{\partial \phi_{u1}}{\partial x} \\ 0 \\ 0 \end{matrix} \right\} dx dy q_{u1} \\ &+ \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial \phi_{u1}}{\partial x} \quad 0 \quad 0 \right\} [B] \left\{ \begin{matrix} \frac{\partial^2 \phi_{w1}}{\partial x^2} \\ 0 \\ 2 \frac{\partial^2 \phi_{w1}}{\partial x \partial y} \end{matrix} \right\} dx dy q_{w1} \\ &= \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial \phi_{u1}}{\partial x} \quad 0 \quad 0 \right\} \left[ \begin{matrix} N_{PX} \\ 0 \\ 0 \end{matrix} \right] dx dy \end{aligned}$$

So, after all these evaluations this quantity comes to be minus  $c$  by  $2$ ,  $c$  by  $2$ ,  $0$  to  $1$ . So, here we have  $\text{del } \phi_{u1}$  by  $\text{del } x$ ,  $A_{XX}$  multiplied by  $\text{del } \phi_{u1}$  by  $\text{del } x$ ,  $dx dy$ ,  $q_{w1}$ . We are just evaluating this term. And then we have minus  $c$  by  $2$ ,  $c$  by  $2$ ,  $0$  to  $1$ . If we evaluate this term, we will get  $\text{del } \phi_{u1}$  by  $\text{del } x$  multiplied by  $B_{11}$ . So, it is it is not  $B_{11}$ , it will be  $B_{XS}$   $B_{XS}$  multiplied by twice of  $\text{del } \phi_{w1}$   $x$   $y$  by  $\text{del } x$   $\text{del } y$ , and  $dx dy$   $q_{w1}$ . Finally, at the right-hand side we have minus  $c$  by  $2$ ,  $c$  by  $2$ ,  $0$  to  $1$   $\text{del } \phi_{u1}$  by  $\text{del } x$   $N_{PX}$   $dx dy$ .

$$\int_{-c/2}^{c/2} \int_0^l \left( \frac{\partial \phi_{u1}}{\partial x} \right) A_{XX} \left( \frac{\partial \phi_{u1}}{\partial x} \right) dx dy q_{u1} + \int_{-c/2}^{c/2} \int_0^l \left( \frac{\partial \phi_{u1}}{\partial x} \right) B_{XS} \left( 2 \frac{\partial^2 \phi_{w1}}{\partial x \partial y} \right) dx dy q_{w1}$$

$$= \int_{-c/2}^{c/2} \int_0^l \left( \frac{\partial \phi_{u1}}{\partial x} \right) N_{PX} dx dy$$

So, there is one equation where  $q_{u1}$  and  $q_{w1}$  are the unknowns.

(Refer Slide Time: 29:26)

Handwritten derivation on a whiteboard:

$$\int_{-c/2}^{c/2} \int_0^l [B_T]^T [A] [B_T] dx dy q_{u1} + \int_{-c/2}^{c/2} \int_0^l [B_T]^T [B] [B_W] dx dy q_{w1}$$

$$= \int_{-c/2}^{c/2} \int_0^l [B_T]^T \{N_P\} dx dy$$

$$\Rightarrow \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial \phi_{u1}}{\partial x} \right\} [A] \left\{ \frac{\partial \phi_{u1}}{\partial x} \right\} dx dy q_{u1} + \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial \phi_{u1}}{\partial x} \right\} [B] \left\{ \begin{matrix} \frac{\partial^2 \phi_{w1}}{\partial x^2} \\ 0 \\ 2 \frac{\partial^2 \phi_{w1}}{\partial x \partial y} \end{matrix} \right\} dx dy q_{w1}$$

$$= \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial \phi_{u1}}{\partial x} \right\} \left\{ \begin{matrix} N_{PX} \\ 0 \\ 0 \end{matrix} \right\} dx dy$$

$$\Rightarrow \int_{-c/2}^{c/2} \int_0^l \frac{\partial \phi_{u1}}{\partial x} A_{XX} \frac{\partial \phi_{u1}}{\partial x} dx dy q_{u1} + \int_{-c/2}^{c/2} \int_0^l \frac{\partial \phi_{u1}}{\partial x} B_{XS} 2 \frac{\partial^2 \phi_{w1}}{\partial x \partial y} dx dy q_{w1} = \int_{-c/2}^{c/2} \int_0^l \frac{\partial \phi_{u1}}{\partial x} N_{PX} dx dy$$

Next, we have to form another equation and, in that equation, would be again with  $q_{u1}$  and  $q_{w1}$  as the unknowns and that equation would look like this. 0 to L and here we have  $B_T$  transpose multiplied by  $B_W$  transpose multiplied by the B matrix, dx dy. And this is multiplied with  $q_{u1}$  plus minus c by 2, minus c by 2, 0 to l  $B_W$  transpose multiplied by D multiplied by  $B_W$  dx dy. And then at the right-hand side we have  $\frac{\partial^2 \phi_{w1}}{\partial x^2}$ ,  $2 \frac{\partial^2 \phi_{w1}}{\partial x \partial y}$ , but there is no actuation because the actuation is purely in plane actuation. Our piezo's are actuated symmetrically with same voltage. So, we can write it here. Pure in plane actuation.

$$\int_{-c/2}^{c/2} \int_0^l [B_w]^T [B] [B_l] dx dy q_{u1} + \int_{-c/2}^{c/2} \int_0^l [B_w]^T [D] [B_w] dx dy q_{w1}$$

$$= \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial \phi_{w1}}{\partial x} \quad 0 \quad 2 \frac{\partial^2 \phi_{w1}}{\partial x \partial y} \right\} \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} dx dy$$

Now, if these expressions are simplified, this comes to be this  $2 \phi_{w1} \times y$ . Then we have  $B_{XS} \phi_{u1} \times dx dy q_{u1}$  and then we have minus  $c$  by  $2$ ,  $c$  by  $2$ ,  $0$  to  $L$  and here we have contributions from  $D$  matrix and that is  $\phi_{w1} \times x \times D_{XS} \phi_{w1} \times x$  plus  $\phi_{w1} \times y$  and then we have  $D_{SS}$  again twice  $\phi_{w1} \text{ comma } x y dx dy$ . And then at the right-hand side we have  $0$ .

$$\int_{-c/2}^{c/2} \int_0^l 2 \phi_{w1,xy} B_{XS} \phi_{u1,x} dx dy q_{u1}$$

$$+ \int_{-c/2}^{c/2} \int_0^l (\phi_{w1,xx} D_{xx} \phi_{w1,xx} + 2 \phi_{w1,xy} D_{SS} 2 \phi_{w1,xy}) dx dy q_{w1} = 0$$

So, here the derivatives are written as comma with subscripts and here it was written as the derivative itself, but again they are same. So, we have got 2 equations, the previous equation is this. Here I have unknowns  $q_{u1}$ ,  $q_{w1}$ . Next equation is this. Here I have unknowns  $q_{u1}$ ,  $q_{w1}$ . And so, 2 equations 2 unknowns we can solve these 2 equations. After solving these equations, we can find out  $q_{u1}$  and  $q_{w1}$ . So, let us give some number to it maybe we call it 1 and maybe we call it 2. So, solving 1 and 2,  $q_{u1}$ ,  $q_{w1}$  can be found out. So, in this problem ah it was an antisymmetric laminate the actuation was a pure in plane actuation. Now although the actuation was actuation was in plane actuation because of the  $B$  matrix being non zero we had to solve the 2 coupled equations. So, we got  $q_{u1}$  and  $q_{w1}$  each of these  $u_0$  and  $w$  had 1 term in the approximation.

So, after this solution we can find out the constants associated with each of these terms unknown constants and after getting these 2 constants we can again back substitute and find out your  $u_0$  and  $w$  and that solves the problem.

(Refer Slide Time: 34:20)

$$\int_{-c/2}^{c/2} \int_0^l [B_w]^T [D] [B_w] dx dy q_{u1} + \int_{-c/2}^{c/2} \int_0^l [B_w]^T [D] [B_w] dx dy$$

$$= \int_{-c/2}^{c/2} \int_0^l \left\{ \frac{\partial^2 \phi_{u1}}{\partial x^2} = \frac{\partial^2 \phi_{u1}}{\partial x^2} \right\} \begin{Bmatrix} 0 \\ 0 \\ 0 \end{Bmatrix} dx dy$$

pure in plane activation

$$\Rightarrow \int_{-c/2}^{c/2} \int_0^l 2\phi_{w1,xy} B_{xx} \phi_{u1,x} dx dy q_{u1}$$

$$+ \int_{-c/2}^{c/2} \int_0^l (\phi_{w1,xx} D_{xx} \phi_{w1,xx} + 2\phi_{w1,xy} D_{xy} 2\phi_{w1,xy}) dx dy q_{w1} = 0$$

solving ① and ②  $q_{u1}, q_{w1}$  can be found out

So, with this I would conclude this lecture.

Thank you.
