Lecture-04
Time-Dependent Perturbation Theory of Two States (Part-1)

Hello welcome to the lecture number 4 of the course quantum mechanics and molecular spectroscopy. Before we get on with the lecture number 4 we will have a quick recap of lecture number 3, in lecture number 3 we looked at 2 important points.

(Refer Slide Time: 00:54)

$$\langle A \rangle = \langle \Psi | \hat{A} | \Psi \rangle = \int \Psi^* \hat{A} \Psi d\tau$$

$$= \langle \Psi | \hat{A} | \Psi \rangle = \int \Psi^* \hat{A} \Psi d\tau$$

$$\Psi = \psi e^{-iEt/\hbar} \Rightarrow \text{Stationary State}$$

$$\frac{d\langle A \rangle}{dt} = \frac{i}{\hbar} \langle [\hat{H}, \hat{A}] \rangle$$

$$\hat{F}, \hat{G}$$

$$\Delta F \cdot \Delta G \geq \frac{1}{2} \langle [\hat{F}, \hat{G}] \rangle$$

$$\Delta x \cdot \Delta p_x \geq \frac{1}{2} \hbar \quad [x, p_x] \neq 0 \text{ do not commute}$$

First is that an average value of A operator it is given by $\langle \Psi | \hat{A} | \Psi \rangle$ this is nothing but integral $\int \Psi^* \hat{A} \Psi d\tau$ ok. This is also equal to $\langle \Psi | \hat{A} | \Psi \rangle = \int \Psi^* \hat{A} \Psi d\tau$ where Ψ equals to $\psi e^{-iEt/\hbar}$ and of course it is only valid if you know ψ is a stationary state. Secondly we said that the time dependence of the average value of operator A is equal to $\frac{i}{\hbar}$ average value of the commutator $[H, A]$ ok.

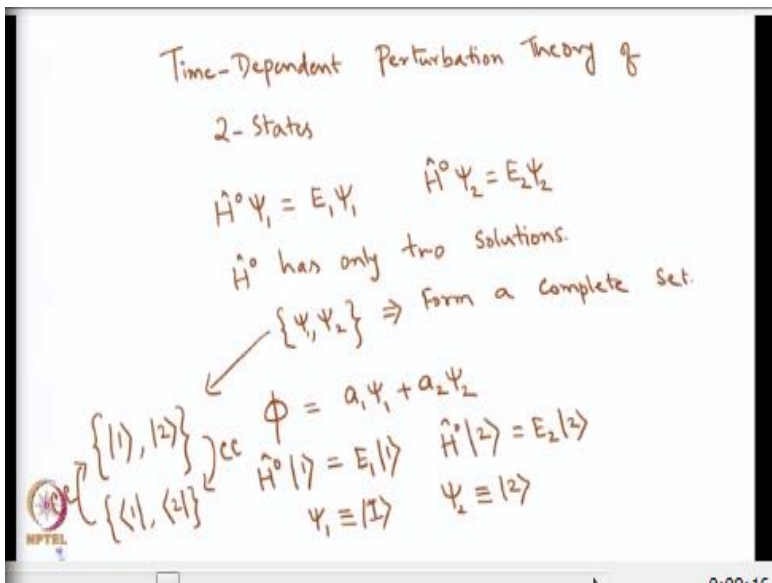

It simply means that the average value of A or the expectation value of an operator A will have time dependence or not will depend on whether it will commute with the Hamiltonian or not. If it commutes with Hamiltonian then there will be no time dependence and if it does not commute with Hamiltonian it will show some time dependence. And I also told you that this is very useful in spectroscopy.

Because the operator A corresponding to the interaction of light with the matter or white with molecule or atom ok does not commute with the Hamiltonian of the molecule or the atom ok. Therefore 1 can make a transition from a one expectation value say 1s orbital or 1s energy level and hydrogen atom to some other energy level say 2s or 2p. There is another interesting thing that is if we have 2 operators F and G.

The uncertainty relation of the expectation value of operators F and G is equal to is always going to be greater than 1/2 of F and G commutators ok. For example we know that Heisenberg's uncertainty principle says $\Delta x \cdot \Delta p_x$ should be greater than or equal to $1/2 \hbar$ which means the operator x and operator P x ok do not commute in fact this is not equal to 0 ok.

Now, so now we know the time dependence of an average value of A will just depend on that operator will commute with Hamiltonian or not ok. We will now go to the second part of our course that is the time dependent perturbation theory. To begin with I will show only time dependent perturbation theory of 2 states because it has some interesting consequences.

(Refer Slide Time: 05:28)

So, we will start with time dependent perturbation theory of 2 states ok, now what does this mean, means the following. For example if I had an Hamiltonian H 0 that means some Hamiltonian for which you know the solution and that acts on a wave function psi 1 that will

give you $E_1 \psi_1$. And this H_0 acts on ψ_2 will give you $E_2 \psi_2$ and H_0 has only 2 solutions ok that is.

So, therefore the ψ_1 and ψ_2 form complete set and what did they say about complete set any arbitrary function ψ can now be written as a linear combination of $a_1 \psi_1 + a_2 \psi_2$ ok. This is like a plane ok, if you have a plane you only need 2 coordinates sorry x and y . So, any point in the plane is a linear combination of x and y ok. So, we have a kind of a restricted environment where the Hamiltonian will be restricted to a plane that is consisting of ψ_1 and ψ_2 ok.

Now I am going to slightly rewrite this ok, so you have H_0 in terms of bracket notation $H_0 \psi_1 = E_1 \psi_1$ and $H_0 \psi_2 = E_2 \psi_2$ where ψ_1 is identically equal to 1, ψ_2 is identically equal to 2 ok. So, if ψ_1 and ψ_2 form a complete set then there is another complete set that is nothing but 1, 2. I also told you that there is also another complete set that is made up of complex conjugates of 1 and 2. So, that is nothing but set 1, 2, so these 2 are complex conjugates of each other ok.

(Refer Slide Time: 09:25)

Handwritten mathematical derivation showing the expansion of a wave function Ψ in terms of basis states ψ_1 and ψ_2 , and the application of the Hamiltonian operator \hat{H} .

$$\hat{H} \psi_1 = E_1 \psi_1 \quad \hat{H} \psi_2 = E_2 \psi_2$$

$$\hat{H} = \hat{H}_0 + \hat{H}'(t)$$

$$\Psi = a_1(t) \psi_1 e^{-iE_1 t/\hbar} + a_2(t) \psi_2 e^{-iE_2 t/\hbar}$$

$$i\hbar \frac{\partial \Psi}{\partial t} = \hat{H} \Psi$$

$$\text{LHS } i\hbar \frac{\partial}{\partial t} \left\{ a_1(t) e^{-iE_1 t/\hbar} \psi_1 + a_2(t) e^{-iE_2 t/\hbar} \psi_2 \right\}$$

$$= \hat{H} \left\{ a_1(t) e^{-iE_1 t/\hbar} \psi_1 + a_2(t) e^{-iE_2 t/\hbar} \psi_2 \right\} \text{ RHS}$$

So, now we have this problem in which H_0 of 1 is equal to $E_1 \psi_1$ and H_0 of 2 is equal to $E_2 \psi_2$ ok. Now let there be a some kind of perturbation ok, so what will this perturbations to it will move the states. So, let me write the Hamiltonian corresponding to other when you have a

perturbation the total Hamiltonian H will be nothing but H_0 plus some perturbation H' of t because we are looking at time dependent perturbation ok.

Now let us suppose ok if there is a point or a ball kept on the surface of a floor. And then one can think of playing a football, so constantly someone is kicking it ok because then the balls will keep moving all over the floor. Or if you go to a football match ok then there is this floor or the ground in which there is a football is kept and the players are kicking the ball in different directions and that is your time dependent perturbation.

So, what will it happen, it will keep moving its position but let us assume that it is always restricted to the ground ok, so but its position is going to change. So, every time you have a new position it can be written as a linear combination of some ν_x and ν_y . So, it has to be a linear combination of ν_1 and ν_2 and this position is going to be time dependent. Therefore the wave function ψ can be now written as $a_1 e^{-i E_1 t / \hbar} + a_2 e^{-i E_2 t / \hbar}$.

So, that is my wave function, that wave function works with this entire Hamiltonian. Of course if H' goes to 0 then a_1 and a_2 will collapse to some value ok either a_1 will go to 0 or a_2 will go to 0 ok. So, now we will go back to our Schrodinger equation which is nothing but $\hbar \frac{d}{dt} \psi = H \psi$. So, finally what we want to do is, we want to solve this Schrodinger equation with this wave function ok, so let us do it.

So, this will be $\hbar \frac{d}{dt} (a_1 e^{-i E_1 t / \hbar} + a_2 e^{-i E_2 t / \hbar}) = (E_1 a_1 e^{-i E_1 t / \hbar} + E_2 a_2 e^{-i E_2 t / \hbar})$. This should equal to $\hbar \frac{d}{dt} (a_1 e^{-i E_1 t / \hbar} + a_2 e^{-i E_2 t / \hbar})$. Now this is a long equation, so what I am going to do is I am going to call this as LHS that is left hand side then I am going to call this as RHS. I will evaluate the left hand side and right hand side independently and then equate them later.

(Refer Slide Time: 14:18)

$$\begin{aligned}
 \text{LHS} &= i\hbar \frac{\partial}{\partial t} \left\{ \frac{a_1(t) e^{-iE_1 t / \hbar}}{L_1} + \frac{a_2(t) e^{-iE_2 t / \hbar}}{L_2} \right\} \\
 &= i\hbar \left\{ \dot{a}_1(t) e^{-iE_1 t / \hbar} + a_1(t) \left(\frac{-iE_1}{\hbar} \right) e^{-iE_1 t / \hbar} \right\} + i\hbar \left\{ \dot{a}_2(t) e^{-iE_2 t / \hbar} + a_2(t) \left(\frac{-iE_2}{\hbar} \right) e^{-iE_2 t / \hbar} \right\} \\
 &= i\hbar \left\{ \frac{\dot{a}_1(t) e^{-iE_1 t / \hbar}}{L_1} + \frac{\dot{a}_2(t) e^{-iE_2 t / \hbar}}{L_2} \right\} + \left\{ \frac{E_1 a_1(t) e^{-iE_1 t / \hbar}}{L_3} + \frac{E_2 a_2(t) e^{-iE_2 t / \hbar}}{L_4} \right\}
 \end{aligned}$$

$\dot{a}_1(t) = \frac{da_1(t)}{dt}$
 $\dot{a}_2(t) = \frac{da_2(t)}{dt}$

So, let us start with LHS, LHS equals to $i\hbar \frac{d}{dt}$ of $\frac{a_1(t) e^{-iE_1 t / \hbar}}{L_1} + \frac{a_2(t) e^{-iE_2 t / \hbar}}{L_2}$ ok. Now let us take the derivative, now you will see that in each of these terms ok term 1 and term 2. There are 2 time dependent parts $a_1(t)$ and $e^{-iE_1 t / \hbar}$ similarly $a_2(t)$ and $e^{-iE_2 t / \hbar}$. So, you have to use a product rule of differentiation what you get is $i\hbar \dot{a}_1(t) e^{-iE_1 t / \hbar}$ ok where $\dot{a}_1(t)$ is equal to $\frac{da_1(t)}{dt}$.

Similarly $\dot{a}_2(t)$ is equal to $\frac{da_2(t)}{dt}$, it just a notation ok just keep in mind when I say put a dot over something, it means it is a time derivative ok, $e^{-iE_1 t / \hbar}$ to the power of $-iE_1 t / \hbar$ + $a_1(t)$. Now $a_1(t)$, now I will take the time derivative of the other one this will be $-iE_1 a_1(t) e^{-iE_1 t / \hbar}$. Similarly you get $\dot{a}_2(t) e^{-iE_2 t / \hbar} + a_2(t) (-iE_2) e^{-iE_2 t / \hbar}$.

So, this I can rewrite as is equal to $i\hbar \dot{a}_1(t) e^{-iE_1 t / \hbar} + \dot{a}_2(t) e^{-iE_2 t / \hbar}$ ok. Now you can see there is an i here and there is an i here, i square that will be -1 and there is a $-$ sign as well. So, that will become $+1$, there is the \hbar in the numerator and there is an \hbar in the denominator, so these 2 get cancelled. So, essentially what you get is that $+E_1 a_1(t) e^{-iE_1 t / \hbar} + E_2 a_2(t) e^{-iE_2 t / \hbar}$.

So, there are 4 terms, I will call this us L 1 that is LHS 1, L 2 that is LHS 2, L 3 LHS 3, L4 LHS 4 ok.

(Refer Slide Time: 19:11)

$$\begin{aligned}
 \text{RHS} &= \hat{H} \left\{ a_1(t) e^{-iE_1 t/\hbar} |1\rangle + a_2(t) e^{-iE_2 t/\hbar} |2\rangle \right\} \\
 &= \left\{ \hat{H}^0 + \hat{H}'(t) \right\} \left\{ a_1(t) e^{-iE_1 t/\hbar} |1\rangle + a_2(t) e^{-iE_2 t/\hbar} |2\rangle \right\} \\
 &= \left\{ a_1(t) e^{-iE_1 t/\hbar} \hat{H}^0 |1\rangle + a_2(t) e^{-iE_2 t/\hbar} \hat{H}^0 |2\rangle \right. \\
 &\quad \left. + a_1(t) \hat{H}'(t) e^{-iE_1 t/\hbar} |1\rangle + a_2(t) \hat{H}'(t) e^{-iE_2 t/\hbar} |2\rangle \right\} \\
 &= \underbrace{\left\{ \frac{E_1 a_1(t) e^{-iE_1 t/\hbar} |1\rangle}{R_1} + \frac{E_2 a_2(t) e^{-iE_2 t/\hbar} |2\rangle}{R_2} \right\}}_{R_3} + \underbrace{\left\{ a_1(t) \hat{H}'(t) e^{-iE_1 t/\hbar} |1\rangle + a_2(t) \hat{H}'(t) e^{-iE_2 t/\hbar} |2\rangle \right\}}_{R_4}
 \end{aligned}$$

LHS = RHS L3 = R1 L4 = R2

Now let us look at the RHS, this is nothing but your \hat{H} ok acting on your wave function that is nothing but a 1 of $t E$ to power of $-i E t$ by \hbar + a 2 $t e$ to the power of $-i a 2 t$ by \hbar ok. Now I want to quickly go back and see that you know there are 4 terms ok, the first 2 terms of the time derivatives with respect to a 1 and a 2 and the second 2 terms are have this energy values E_1 and E_2 , so something that you must remember ok.

Now this is equal to this is nothing but is equal to your \hat{H} is nothing but $\hat{H}^0 + \hat{H}'(t)$ ok. Now this must act on a 1 of $t e$ to the power of $-i E_1 t$ by \hbar + a 2 $t e$ to the power of $-i E_2 t$ by \hbar ok. So this will be not nothing but a 1 of $t E$ to the power of $-i e_1 t$ by \hbar , \hat{H}^0 will only act on 1. So, \hat{H}^0 acting on 1 + a 2 times $t e$ to the power of $-i E_2 t$ by \hbar \hat{H}^0 acting on 2.

You see because \hat{H}^0 is your initial Hamiltonian which is nothing but your time independent Hamiltonian. So, it will not act on anything that is time dependent ok. So, either a 1 t or a 2 to the power of $-i E_1 t$ by \hbar , it will only act on the state a 1 and give you E_1 ok. Similarly the second part of the equation ok + a 1 $t \hat{H}'(t)$ now acting on e to the power of $-i E_1 t$ by \hbar acting on 1 + a 2 times $t \hat{H}'(t)$ acting on a 2 to the power of $-i E_2 t$ by \hbar ok.

So, these are the 4 terms that you will get, now when H_0 acts on 1 will give me E_1 . So this will become $E_1 a_1$ of $t e$ to the power of $-i E_1 t$ by \hbar + second one H_0 acting on 2 will give you $E_2 t$. So, $E_2 a_2$ of $t e$ to the power of $-i E_2 t$ by \hbar + the 2 terms that is a $0 a_1 t$ H' of t acting on e to the power of $-i E_1 t$ by \hbar + a_2 of $t H'$ of t acting on e to the power of $-i E_2 t$ by \hbar .

So, here also we get 4 terms, this I will call it as right hand side 1 R1, right hand side term 2, R2, right hand side term 3, R3, right hand side term 4, R4. So, but you know LHS and RHS must be equal, so LHS must be equal to RHS. Now you will quickly see that L3 term is equal to R1 term and L4 term is equal to R2 term. So, this one here and this one here R 1, R2 will be equal to L3, L3 and L4. So, since L3 and L4 are equal to R1 + R2, so which means you can cancel out each.

(Refer Slide Time: 25:08)

The slide shows the following handwritten mathematical steps:

$$i\hbar \left\{ \dot{a}_1(t) e^{-iE_1 t/\hbar} |1\rangle + \dot{a}_2(t) e^{-iE_2 t/\hbar} |2\rangle \right\}$$

$$= a_1(t) H(t) e^{-iE_1 t/\hbar} |1\rangle + a_2(t) H(t) e^{-iE_2 t/\hbar} |2\rangle$$

multiply with ψ_1^* on the left and integrate
 $\langle 1 |$ and integrate.

$$i\hbar \left\{ \langle 1 | \dot{a}_1(t) e^{-iE_1 t/\hbar} |1\rangle + \langle 1 | \dot{a}_2(t) e^{-iE_2 t/\hbar} |2\rangle \right\}$$

$$= \left\{ \langle 1 | a_1(t) H(t) e^{-iE_1 t/\hbar} |1\rangle + \langle 1 | a_2(t) H(t) e^{-iE_2 t/\hbar} |2\rangle \right\}$$

So, what you will be left out with is $i \hbar a_1 t e$ to the power of $-i E_1 t$ by \hbar + $a_2 t e$ to the power of $-i E_2 t$ by \hbar is equal to $a_1 t H'$ of t acting on e to the power of $-i E_1 t$ by \hbar + $a_2 t H'$ of t acting on e to the power of $-i E_2 t$ by \hbar , so this is what you get from that equation ok. Now let us do some little bit of math ok, now what I am going to do is the following.

I am going to multiply with ψ_1^* on the left and integrate, this simply means that I will put a function like that and multiply and integrate. Now if I do that you will get $i \hbar a_1 t e$ to the

power of $-i E_1 t$ by \hbar $1 + 1 a_2 t$ e to the power of $-i E_2 t$ by \hbar 2, this is equal to $1 a_1 t$
H prime t e to the power of $-i E_1 t$ by \hbar $1 + 1 a_2 t$ H prime t e to the power of $-i E_2 t$ by \hbar
2 ok, I will have 4 integrals that I have to evaluate.

If I can evaluate these 4 integrals then I will know the time dependence of this perturbation. We
will carry on the remaining part in the next lecture, I am going to stop now, thank you.
