Lecture – 6
Time-Dependent Perturbation Theory of Two States (Part – 3)

Hello, welcome to the lecture number 6 of the course quantum mechanics and molecular spectroscopy. We will have a quick recap of contents of lecture number 5.

(Refer Slide Time: 03:37)

$$\begin{aligned} \hat{H}^0 |1\rangle &= E_1 |1\rangle & \hat{H}^0 |2\rangle &= E_2 |2\rangle \\ \{|1\rangle, |2\rangle\} &\Rightarrow \text{Complete Set} \\ &\Rightarrow \text{Orthonormal} \\ \langle 1|2\rangle &= 0 & \langle 1|1\rangle &= \langle 2|2\rangle = 1 \end{aligned}$$

$$\hat{H}^0 + \hat{H}'(t) = \hat{H}$$

$$i\hbar \frac{\partial}{\partial t} \Psi(t) = \hat{H} \Psi(t)$$

$$\Psi = a_1(t) e^{-iE_1 t/\hbar} |1\rangle + a_2(t) e^{-iE_2 t/\hbar} |2\rangle$$

$$\begin{aligned} i\hbar \dot{a}_1(t) e^{-iE_1 t/\hbar} &= a_2(t) e^{-iE_2 t/\hbar} \langle 1|\hat{H}'(t)|2\rangle \\ i\hbar \dot{a}_2(t) e^{-iE_2 t/\hbar} &= a_1(t) e^{-iE_1 t/\hbar} \langle 2|\hat{H}'(t)|1\rangle \end{aligned}$$

In the lecture number 5, we looked at the perturbation theory of two states in which if you had Hamiltonian H_0 such that it acted on state 1 and produced E_1 and H_0 acting on state 2 gives you E_2 and the states 1 and 2 form complete set and they are orthonormal. Orthonormal simply means integral of 1 over 2 = 0 and the integral of 1 over 1 should be equal to 2 over 2 which is equal to 1 okay.

Now, we said that there is a time-dependent perturbation that acts on states 1 and 2 of the system which is nothing but H' of t and this when added to H_0 will give you the total Hamiltonian H and it will follow the time-dependent Schrodinger equation okay. In this case, the Ψ is a superposition state, one can think of $\Psi = a_1$ of t e to the power of $-i E_1 t$ by \hbar + a_2 of t e to the power of $-i E_2 t$ by \hbar okay. So this is the wave function Ψ .

Now, by plugging the Ψ in the Schrodinger equation, we ended up with the following equation after doing some amount of algebra that is nothing but $i\hbar \dot{a}_1$ dot t e to the power

of $-i E_1 t$ by \hbar should be equal to a_2 of $t e$ to the power of $-i E_2 t$ by \hbar integral over 1 H prime of t^2 . Similarly, we had $i\hbar a_2 \dot{t} e$ to the power of $-i E_2 t$ by $\hbar = a_1$ of $t e$ to the power of $-i E_1 t$ by \hbar $2 H$ prime of t^1 okay. So, these are the equations that we ended up in the last lecture.

(Refer Slide Time: 04:32)

$$i\hbar \dot{a}_1(t) e^{-iE_1 t/\hbar} = a_2(t) \left[e^{-iE_2 t/\hbar} \right] \langle 1 | \hat{H}'(t) | 2 \rangle$$

↑
definite integral.

$$\dot{a}_1(t) = \frac{d}{dt} a_1(t)$$

$$\dot{a}_1(t) = \frac{1}{i\hbar} \left[a_2(t) e^{-i(E_2 - E_1)t/\hbar} \right] \langle 1 | \hat{H}'(t) | 2 \rangle$$

$E_2 - E_1 = \Delta E_{21} = \hbar\omega_{21}$

$$a_1(t) = \frac{1}{i\hbar} \left[a_2(t) e^{-i\omega_{21}t} \right] \langle 1 | \hat{H}'(t) | 2 \rangle$$

$$a_2(t) = \frac{1}{i\hbar} \left[a_1(t) e^{i\omega_{21}t} \right] \langle 2 | \hat{H}'(t) | 1 \rangle$$

if $H(t)$ in Hermitian
the
 $\langle 1 | \hat{H}'(t) | 2 \rangle = \langle 2 | \hat{H}'(t) | 1 \rangle$

$a_1(t)$ & $a_2(t)$ are
out of phase wr. to
each other

Now, let us start looking at this equation little bit more carefully $i\hbar a_1 \dot{t} e$ to the power of $-i E_1 t$ by $\hbar = a_2 t e$ to the power of $-i E_2 t$ by \hbar $1 H$ prime of t^2 okay. Now, of course this is a definite integral. This definite integral will give you some number okay. It could be 0, but definitely it could be a number. If this is some number and $a_2 t$ is a coefficient and e to power of $-i$ is the phase factor.

So all this tells you that the time dependence of a , by the way $a_1 \dot{t}$ is nothing but d by dt of a_1 of t . So, the time dependence of a_1 coefficient will depend on a_2 coefficient okay. One can rewrite this little bit in a different way. So, $a_1 \dot{t}$ is equal to, so one can take $i\hbar$ on the other side, $i\hbar$ into a_2 of e to the power of, now you can take this exponential function on the other side, so what we will get is $-i E_2 - E_1$ into t by \hbar and the integral $1 H$ prime of t^2 okay.

Now, of course we can write $E_2 - E_1$ is equal to ΔE_{21} , so this is equal to $\hbar\omega_{21}$. So, if I write that way, then I get $a_1 \dot{t} = 1$ over $i\hbar$ a_2 of $t e$ to the power of $-i\omega_{21} t$ because this \hbar and that \hbar will get cancelled okay into $1 H$ prime t^2 okay. Now, you can also rewrite the same equation starting from the other equation for $a_2 \dot{t}$. So that will come out to be $a_2 \dot{t}$ will be equal to 1 over $i\hbar$ a_1 of $t e$ to the power of $i\omega_{21} t$

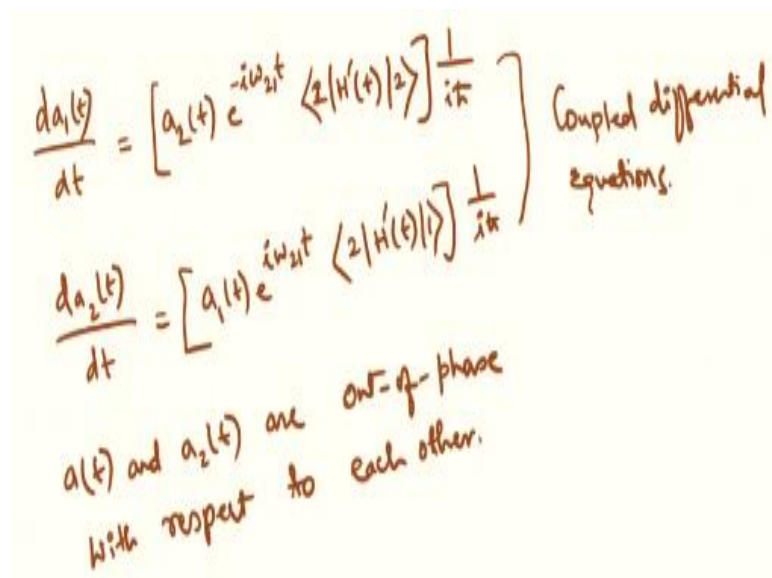

2 H' of t 1.

Now I will quickly realize if H' of t is Hermitian, then the integrals 1 H' of t 2 should be equal to 2 H' of t 1, of course this is only true when H' is Hermitian. Then you will see that this one and these two will be equal or if they are not even, if this H' is not Hermitian, then this will be complex conjugates of each other. Now you will see that this is if you look at the constants, this $i\hbar$ is a constant, okay.

Now, these are some constants because they are definite integrals okay. We will have either complex conjugate of each other or they are equal to each other. Now, all you can see that a_1 dot's dependence on a_2 is with this function e to the power of $-i\omega_2 t$ while as a_2 dot's dependence will be on e to the power of $i\omega_2 t$. So, these two functions are out of phase with respect to each other, simply something like this okay, so that will be our a_2 .

So, whenever a_2 will go up a_1 will come down and whenever a_2 will come down a_1 will go up okay. So that is the time dependence of the two, a_1 and a_2 which are out of phase, a_1 of t and a_2 of t are out of phase with respect to each other okay.

(Refer Slide Time: 10:04)

$$\frac{da_1(t)}{dt} = \left[a_2(t) e^{-i\omega_2 t} \langle 2|H'(t)|2 \rangle \right] \frac{1}{i\hbar}$$

$$\frac{da_2(t)}{dt} = \left[a_1(t) e^{i\omega_2 t} \langle 2|H'(t)|1 \rangle \right] \frac{1}{i\hbar}$$

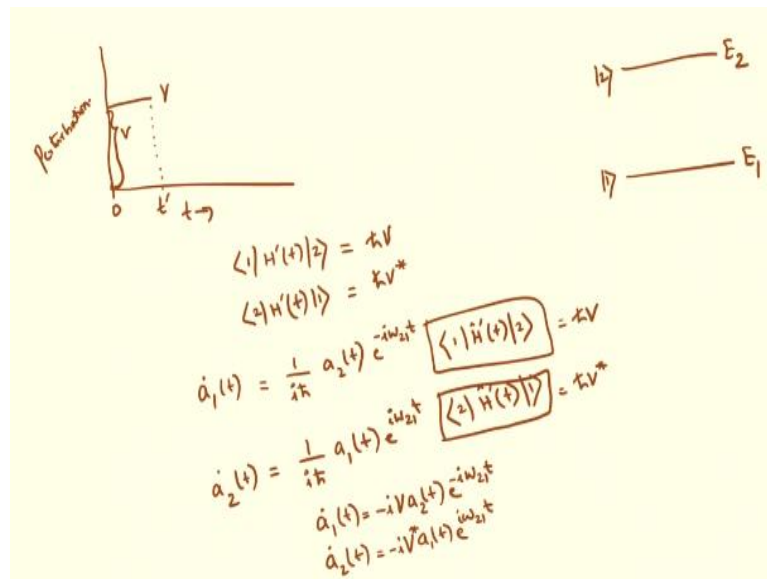

Coupled differential equations.

$a_1(t)$ and $a_2(t)$ are out-of-phase with respect to each other.

Now, if such is the scenario, so we need to solve this coupled differential equations which are nothing but da_1 of t by $dt = a_2$ of $t e$ to the power of $-i\omega_2 t$ $\langle 2|H'$ of $t|2 \rangle$ and da_2 of t by $dt =$ whole thing divided by 1 by $i\hbar$, a_1 of $t e$ to the power of $i\omega_2 t$ $\langle 2|H'$ of $t|1 \rangle$ over $i\hbar$ okay. So these two are coupled differential equations okay and such that a_1 of t and a_2 of t are out of phase with respect to each other okay. Now of course it is kind of

difficult to solve, but we will make an attempt.

(Refer Slide Time: 11:51)

Now let us assume there are 2 two states, 1 and 2 with energies E_1 and E_2 okay. Now at time $t = 0$, I am going to switch on a constant perturbation okay and it is constant. So what happens is that a time and only if I think of perturbation, so I will switch on a time $t = 0$, this is time, it is equal to 0, I will switch on a constant perturbation for some time okay until this goes to say t' okay and I will have some value, let us call it as V okay.

So this is V okay. Now in such a way that this $\langle 1 | H'(t) | 2 \rangle$ becomes $\hbar V$ and $\langle 2 | H'(t) | 1 \rangle$ becomes $\hbar V^*$ okay, where V and V^* are complex conjugates with respect to each other. In fact, if you look at these integrals, these integrals are complex conjugates of each other So if such is the scenario, then your $\dot{a}_1(t)$ will be equal to $\frac{1}{i\hbar} a_2(t) e^{-i\omega_{21}t}$.

And you had this integral $\langle 1 | H'(t) | 2 \rangle$ okay and other integral was $\dot{a}_2(t) = \frac{1}{i\hbar} a_1(t) e^{i\omega_{21}t}$ okay. Now, this integral of course is equal to $\hbar V$ and this integral equals to $\hbar V^*$ okay. Then what happens? I can rewrite these equations as the following $\dot{a}_1(t)$ is equal to, this $\hbar V$ and this $\hbar V$ will cancel, i in the denominator will go to the numerator as $-i$.

So, $-i V a_2(t) e^{-i\omega_{21}t}$ that will be $\dot{a}_1(t)$ and your $\dot{a}_2(t)$ will be equal to $\text{minus } -i V^* a_1(t) e^{i\omega_{21}t}$ okay.

(Refer Slide Time: 15:26)

$\dot{a}_1(t) = -iV a_2(t) e^{-i\omega_{21}t}$ $\dot{a}_2(t) = -iV^* a_1(t) e^{i\omega_{21}t}$
 $a_2(t) = \frac{-1}{iV} \dot{a}_1(t) e^{i\omega_{21}t}$ $a_1(t) = \frac{-1}{iV^*} \dot{a}_2(t) e^{-i\omega_{21}t}$
 Differentiate both the equations w.r.t 't'
 $\ddot{a}_1(t) = -iV \dot{a}_2(t) e^{-i\omega_{21}t} - \omega_{21} V a_2(t) e^{-i\omega_{21}t}$
 $\ddot{a}_2(t) = -iV^* \dot{a}_1(t) e^{i\omega_{21}t} + \omega_{21} V^* a_1(t) e^{i\omega_{21}t}$
 $\ddot{a}_1(t) = -a_1(t) V V^* - i\omega_{21} \dot{a}_1(t)$
 $\ddot{a}_2(t) = -a_2(t) V V^* + i\omega_{21} \dot{a}_2(t)$
HOME WORK

So I am going to rewrite them again. So what you had is $a_1 \dot{t} = -iV a_2$ of $t e$ to the power of $-i \omega_{21} t$ okay and $a_2 \dot{t} = -iV^* a_1$ of $t e$ to the power of $i \omega_{21} t$. So what I am going to do is I am going to rewrite this equation a slightly different way. So what I will do is this I will write in terms of a_1 and a_2 . So, one can rewrite this equation as this will become a_2 of $t = -1$ by $iV a_1 \dot{t} e$ to the power of $i \omega_{21} t$ because if this I take on the other side $-i \omega_{21}$ becomes plus.

And this will become a_1 of t will become -1 by $iV^* a_2 \dot{t} e$ to the power of $-i \omega_{21} t$ okay. Now what I will do is I will differentiate once more. Differentiate both the equations with respect to time okay. So what I will get is if I differentiate once more and rearrange okay, what I will get is the following $a_1 \ddot{t} = -iV a_2 \dot{t} e$ to the power of $-i \omega_{21} t - \omega_{21} V a_2$ of $t e$ to the power of $-i \omega_{21} t$ okay.

Similarly, I can get $a_2 \dot{t} = -iV^* a_1 \dot{t} e$ to the power of $i \omega_{21} t + \omega_{21} V^* a_1$ of $t e$ to the power of $i \omega_{21} t$ okay. Then what I can do is instead of a_1 and a_2 , I can plug these here and finally what I can get is the following. After rearrangement what I get is $a_1 \ddot{t} = -a_1$ of $t V V^* - i \omega_{21} a_1 \dot{t}$. Similarly $a_2 \dot{t} = -a_2$ of $t V V^* + i \omega_{21} a_2 \dot{t}$.

So, one can do you know you can all use these 4 equation equations and rearrange okay because wherever there is an a_1 you can plug it in $a_2 \dot{t}$ and then you can do amount of rearrangement. It is not very easy, one can do it as a homework. So this is conversion of these to this okay, you can try it as a homework. It is not very easy, it takes a little more than 10 or

15 minutes or this is just simple math, so one can be able to do it. So what we have is these 2 equations okay.

(Refer Slide Time: 20:49)

$$\ddot{a}_1(t) = -a_1(t)VV^* - i\omega_{21} \dot{a}_1(t) \quad \text{--- (1)} \Rightarrow a_1(t)$$

$$\ddot{a}_2(t) = -a_2(t)VV^* + i\omega_{21} \dot{a}_2(t) \quad \text{--- (2)} \Rightarrow a_2(t)$$

↓ General Solution.

$$a_1(t) = [Ae^{i\Omega t} - Be^{-i\Omega t}] e^{i\omega_{21}t/2}$$

$$a_2(t) = [Ae^{i\Omega t} + Be^{-i\Omega t}] e^{i\omega_{21}t/2}$$

$$\Omega = \frac{1}{2} [\omega_{21}^2 + 4|V|^2]^{1/2}$$

A and B are constants which will depend on initial conditions.

at $t=0$ $a_1(0) = 1$ $a_2(0) = 0$

$$a_1(t) = \left\{ \cos \Omega t + \frac{i\omega_{21}}{2\Omega} \sin \Omega t \right\} e^{-i\omega_{21}t/2}$$

$$a_2(t) = \left(\frac{-i|V|}{\Omega} \right) \sin e^{i\omega_{21}t/2}$$

|> — $a_2(t)$
|> — $a_1(t)$

So the 2 equations that we have is very simply that a_1 double dot $t = -a_1$ of t $V V^* - i$ ω_{21} a_1 dot of t , a_2 double dot of $t = -a_2$ of t $V V^* + i$ ω_{21} of a_2 dot t . Now, by writing this we have done one thing very simple. Now, the equation 1 will only consist of a_1 of t , a_1 of t , its first derivative and its second derivate and this equation 2 will have only a_2 of t . So, a_2 , its first derivative and its second derivatives with respect to.

So, what we have done by doing this, we have separated out the coupled differential equations in a_1 and a_2 as second order differential equations in a_1 and a_2 respectively. So, they are no longer coupled okay, but while going from first order equations we went to second order differential equations to uncouple them. Now, if you have such a case one can find a general solution.

The a_1 of t will be equal to Ae to the power of i $\omega_{21} t - Be$ to the power of $-i$ $\omega_{21} t e$ to the power of $\omega_{21} t$ by 2 and a_2 of $t = Ae$ to the power of i $\omega_{21} t + Be$ to the power of $-i$ $\omega_{21} t e$ to the power of $\omega_{21} t$ by 2 where ω_{21} equal to half of ω_{21}^2 square + four times modulus of V square whole to the power of half and A and B are constants which will depend on initial conditions okay.

Now, one can solve this with the condition that at $t = 0$ a_1 of $0 = 1$ and a_2 of $0 = 0$. Why are we doing that? Because if we had two states 1 and 2 and their coefficients being a_1 of t and

a_2 of t at time $t = 0$, we are assuming that the population is only in the state 1 and state 2 has no population and when you do that, these equations will run on to a_1 of t will be equal to $\cos \omega_{21} t + i \omega_{21} \text{ by } 2 \omega_{21} \sin \omega_{21} t$ whole e to the power of $-i \omega_{21} t$ by 2.

And a_2 of t will be equal to $-i \text{ modulus of } V \text{ by } \omega_{21} \sin e$ to the power of $i \omega_{21} t$ by 2. So, these are the 2 equations that end up and one can then equate to get the probability.

(Refer Slide Time: 25:35)

So, P_1 of t will be nothing but modulus of a_1 of t whole square and P_2 of t that is probability of finding the system in state 2 is a_2 of t modulus squared okay. In such scenario, what we will get is the following okay. P_1 of t after doing some math, what we will get is $1 - 4 \text{ modulus of } V \text{ square divided by } \omega_{21} \text{ square} + 4 \text{ times modulus of } V \text{ square into Sin square half of } \omega_{21} \text{ square} + 4 \text{ times modulus of } V \text{ whole square to the power of half}$.

And P_2 of t will be equal to modulus of V by $\omega_{21} \text{ square Sin } \omega_{21} t$ which will be nothing but for time modulus of V square divided by $\omega_{21} \text{ square} + 4 \text{ times modulus of } V \text{ whole square Sin square half of } \omega_{21} \text{ square} + 4 \text{ times modulus of } V \text{ square to the power of half}$. Now, one can think of this is P_2 of t , but think of it like this. So, there is some function that is $\text{Sin square } x$ and some multiplier.

Now, let us look at P_2 , P_2 of t , now this is $\text{Sin square of some function okay multiplied by something}$. So, let us call it as a $\text{Sin square } x$ okay. So P_1 of t is nothing but $1 - a \text{ Sin square of } x$. So, at time $t = 0$, let us this is 0 and this is 1 that is the population, if I take population,

then my a_1 will go up or go down like that. So, this is P_1 of t and a_2 will whenever will go like this, so this is P_2 of t such that P_1 of $t + P_2$ of $t = 1$.

These oscillations of states 1 and 2 are called Rabi oscillations okay. So we will stop here and continue in the next lecture. Thank you.
