Module - 02
Lecture - 02
Linear independence, basis, dimensionality

We have talked about vectors and scalars, we have talked about vector space and we have talked about vector products.

(Refer Slide Time: 00:22)

The image shows a screenshot of a presentation slide. At the top left is the NPTEL logo, a stylized flower-like shape. At the top right is the Indian Institute of Technology Kanpur logo, a circular emblem with a lamp in the center. The title of the slide is "Module 2: Vectors, Vector Spaces, Vector Functions". Below the title is a bulleted list of topics:

- Vectors and scalars, vector space, Vector products
- Linear independence, basis, dimensionality
- Vector functions, scalar and vector fields, vector differentiation
- Gradient, divergence, curl
- Practice Problems.

Now, the next topic that will be the topic for today's lecture will be linear independence, basis and dimensionality.

(Refer Slide Time: 00:30)

The slide is titled "Linear Independence" and features the NPTEL logo and the Indian Institute of Technology Bombay logo. The text on the slide reads: "Vectors are said to be linearly independent if one cannot be expressed as a linear combination of the others. Formally, vectors $\vec{v}_1, \vec{v}_2, \vec{v}_3 \dots \vec{v}_N$ are said to be linearly independent if $c_1 \vec{v}_1 + c_2 \vec{v}_2 + c_3 \vec{v}_3 \dots + c_N \vec{v}_N = 0$ Only for $c_1 = c_2 = c_3 \dots = c_N = 0$ ". Handwritten notes in red ink include: "Suppose we find Eq 1 satisfied for $c_1 \neq 0$ Linearly DEPENDENT" and " $\vec{v}_1 = -\frac{c_2}{c_1} \vec{v}_2 - \frac{c_3}{c_1} \vec{v}_3 + \dots - \frac{c_N}{c_1} \vec{v}_N$ ".

So, what is linear independence? So, vectors are said to be linearly independent if one cannot be expressed as a linear combination of the others. So, if you take a set of vectors then you say that if you can express one as a combination of the others then you say that they are linearly dependent and if you cannot do that you say that they are linearly independent.

So, formally the way you define linear independence is that if you have a set of vectors V_1, V_2, V_3 up to V_N you say that these vectors are linearly independent if the statement $C_1 V_1$ plus $C_2 V_2$ plus up to $C_N V_N$ equal to 0 is only valid when C_1 equal to C_2 equal to C_3 equal to C_N equal to 0. So, C_1, C_2 etcetera are real numbers; C_1, C_2 up to C_N these are real numbers and this is always true whenever you have C_1 equal to C_2 equal to C_3 and up to C_N equal to 0 then this first relation will hold. So, this first relation holds whenever the second relation holds.

So, the second relation implies the first, but if the vectors are linearly independent then there is no other solution, there is no solution with nonzero $C_1 C_2$ with any one of one or more of these not equal to 0. So, that is what it means to say that the vectors are linearly independent. So, again the formal way of stating is that if you have a statement like $C_1 V_1$ plus $C_2 V_2$ plus $C_3 V_3$ up to $C_N V_N$ equal to 0 that necessarily implies C_1 equal to C_2 equal to C_3 up to C_N equal to 0 if the vectors are linearly independent.

If they are linearly dependent you can have another set of C_1 's where all of them are nonzero which still satisfy the first equation. So, under the way now suppose you have a set, suppose we find equation 1 satisfied for C_1 not equal to 0. So, you find C_1 not equal to 0 and maybe some of the others are also not equal to 0, maybe some of the others are also not equal to 0. So, if you find equation 1 satisfied for let us say C_1 not equal to 0 then I can take V_1 to the other side and I can write it (Refer Time: 03:12) as a following, I can write V_1 is equal to C_2 and I can divide by C_1 because it is not equal to 0 C_1 minus, minus C_3 by $C_1 V_3$ and so on, minus C_N by $C_1 V_N$. Why I am writing this is that C_2 by C_1 is now a real number as a C_3 by C_1 and so on.

So, what I did is I wrote V_1 as a combination as a linear combination. So, this is called a linear combination where you multiply each vector by a real number and you add them up. So, I wrote V_1 as a linear combination of $V_2 V_3$ up to V_n . So, whenever you have vectors that are not linearly this is a case when they are linearly dependent, dependent. So, when vectors are linearly independent then you can write 1 as a linear combination of the other which is the same as this formal statement of linear independence.

Basis and Dimensionality

NPTEL

$$c_1 \vec{v}_1 + c_2 \vec{v}_2 + c_3 \vec{v}_3 + \dots + c_N \vec{v}_N = \vec{0}$$

$$c_1 = c_2 = c_3 = \dots = c_N = 0$$

$$\Delta = \begin{bmatrix} A_x & A_y & A_z \\ B_x & B_y & B_z \\ C_x & C_y & C_z \end{bmatrix}$$

In any vector space there can be only a certain number of linearly independent vectors

3D vector space \vec{A} and \vec{B}

(A_x, A_y, A_z) (B_x, B_y, B_z)

$c_1 \vec{A} + c_2 \vec{B} = \vec{0}$

$\vec{A} = -\frac{c_2}{c_1} \vec{B}$

$c_1 \vec{A} + c_2 \vec{B} + c_3 \vec{C} = \vec{0}$

$c_1 A_x + c_2 B_x + c_3 C_x = 0$

$c_1 A_y + c_2 B_y + c_3 C_y = 0$

$c_1 A_z + c_2 B_z + c_3 C_z = 0$

Condition for existence of nontrivial soln
 $\text{Det } \Delta = 0$

Maximum number of linearly independent vectors is called the basis

So, just to emphasize again we said that these vectors V_1, V_2, V_3 up to V_N are linearly independent if the first equation implies the second. So, now, in any vector space there are always a maximum number of vectors that are linearly independent and we will come to that in a minute. But, let us take an example suppose we take the usual 3

dimensional vector space. Now if you take vectors let us say, if you take any 2 vectors let us say A and B. So, if you take 2 vectors then you ask; what is the condition that these vectors are linearly independent? Now A will have certain components let us say A_x , A_y , A_z and B has components B_x , B_y , B_z .

Now A and B being linearly independent means you will write that you will raise a $C_1 A$ plus $C_2 B$ equal to 0. So, you check if they are linearly independent then this is satisfied by some C_1 and C_2 which are both not 0. So, if this is satisfied for some for some C_1 and C_2 which is not 0 then I can write A as minus C_2 by $C_1 B$ so; that means, A is proportional to B. So, A is a vector that is in the same direction as B it has a slightly different length. So, if you take 2 vectors then when you say that they are linearly dependent; that means, they are proportional to each other. So, if you take only 2 vectors then they are linearly they are linearly dependent if they are proportional to each other. So, this is the condition for 2 vectors.

Now what if you have 3 vectors suppose you have A, B and C, then what we say is that the condition for linear independence is that this $C_1 A$ plus $C_2 B$ plus $C_3 C$ equal to 0 and I should probably emphasize that this is actually a 0 vector. So, in all these cases this left hand side is a vector. So, right hand side is also a vector. So, it is a 0 vector. So, this equal to 0 for some C_1 , C_2 , C_3 not equal to 0. So, if they are linearly dependent then you have some C_1 , C_2 , C_3 which is not equal to 0 for which this is valid and how do you find the C_1 , C_2 , C_3 , I mean how do you state this condition. So, what you will say is that if I write the x y and z components of this I will get 3 equations. So, $C_1 A_x$ plus $C_2 B_x$ plus $C_3 C_x$ equal to 0 and then I will get $C_1 A_y$ plus $C_2 B_y$ plus $C_3 C_y$ equal to 0 and $C_1 A_z$ plus $C_2 B_z$ plus $C_3 C_z$ equal to 0. So, these are the conditions.

So, you have to have some C_1 , C_2 , C_3 which are not all 0 satisfying these 3 equations and you might remember from theory of these are all homogeneous linear equations. So, so if you think of C_1 , C_2 , C_3 as variables these are homogeneous linear equations. Now all these are satisfied for C_1 equal to C_2 equal to C_3 equal to 0, but the condition for non trivial solution as a solution where C_1 , C_2 , C_3 are not all 0. So, that condition for existence of non trivial solution and this you might be familiar. So, we say the determinant involving A_x , B_x , C_x , A_y , B_y , C_y , A_z , B_z , C_z that should be equal to 0.

So, the condition for existence of non trivial solution I will just write determinant of delta equal to 0 and what is this delta. So, delta is this matrix equal to $A_x, A_y, A_z; B_x, B_y, B_z; C_x, C_y, C_z$. So, if the determinant of this matrix delta is 0 then you say A B and C are linearly dependent. So, if this determinant is not equal to 0 then A, B, C are linearly independent. So, in this way you can that there are very easy ways to check whether 2 or 3 vectors are linearly dependent or independent, and you can do this for all vector spaces you can check linear dependence or independence.

(Refer Slide Time: 10:06)

The slide contains the following content:

- Equation: $c_1 v_1 + c_2 v_2 + c_3 v_3 + \dots + c_N v_N = 0$
- Equation: $c_1 = c_2 = c_3 = \dots = c_N = 0$
- Equation: $\Delta = \begin{bmatrix} A_x & A_y & A_z \\ B_x & B_y & B_z \\ C_x & C_y & C_z \end{bmatrix}$
- Text: "In any vector space there can be only a certain number of linearly independent vectors"
- Text: "3D vector space \vec{A} and \vec{B} "
- Equation: $c_1 \vec{A} + c_2 \vec{B} = \vec{0}$
- Equation: $\vec{A} = -\frac{c_2}{c_1} \vec{B}$
- Text: "A, B, C $c_1 \vec{A} + c_2 \vec{B} + c_3 \vec{C} = \vec{0}$ "
- Equation: (A_x, A_y, A_z) and (B_x, B_y, B_z)
- Equation: $c_1 A_x + c_2 B_x + c_3 C_x = 0$
- Equation: $c_1 A_y + c_2 B_y + c_3 C_y = 0$
- Equation: $c_1 A_z + c_2 B_z + c_3 C_z = 0$
- Text: "Condition for existence of nontrivial soln $\text{Det } \Delta = 0$ "
- Text: "Maximum number of linearly independent vectors is called the basis"
- Section Header: "Basis and Dimensionality"

Now, the maximum number of linearly independent vectors is called the basis. So, if instead of having just A B and C if you had a fourth vector D in 3 dimensional space then you would have 4 equations, if you had a fourth vector. So, if you had A, B, C and D then what you would have is you will have C_1, C_2, C_3 and C_4 and you would have 4 unknowns and 3 equations and obviously, you can always find a solution because you can always adjust the fourth variable so that it satisfies these equations. So, what I want to say is that in 3D space you can have a maximum of 3 linearly independent vectors and we will see this in a few minutes.

(Refer Slide Time: 10:49)

NPTEL

Vectors form a basis for a vector space if:

1. They are linearly independent
2. They span the entire vector space

Any vector \vec{V} can be written as $c_1 \vec{b}_1 + c_2 \vec{b}_2 + c_3 \vec{b}_3$

$$\vec{V} = v_x \hat{i} + v_y \hat{j} + v_z \hat{k}$$

Maximum number of linearly independent vectors is called the basis dimension

So, this brings us to the idea of basis and dimensionalities. So, vectors if you have a set of vectors they form a basis for a vector space is 2 conditions first they should be linearly independent and they should span the entire vector space. So, suppose you had 3 vectors b_1 , b_2 and b_3 these should be linearly independent. So, when you say that they should be linearly independent we already saw the definition of linearly independent, a linear independence and they should span the entire vector space. So, what do you mean by they should span a entire vector space? Any vector V can be written as some linear combination of b_1 , b_2 , b_3 .

So, some linear combinations, so I will just write $c_1 b_1$ plus $c_2 b_2$ plus $c_3 b_3$. So, any vector V any vector, you take any vector you can write it as a linear combination of these 3 basis vectors. So, in 3 dimensional vector space, one example - example is i, j, k the unit vectors in the x, y and z direction these form a basis because they are linearly independent you can show this.

For example, if you take the determinant of the components in this delta that we talked about, so if you have i then A_x is 1, A_y and A_z are 0; j for j B_x is 0, B_y is 1, B_z is 0 and for k vector C_x equal to 0, C_y equal to 0, C_z equal to 1 and you can clearly see that the determinant is equal to 1 and it is not 0. So, the determinant of delta equal to 1, so it is not equal to 0. So, just write delta for this i, j, k , delta equal to $1, 0, 0, 0, 1, 0, 0, 0, 1$ and determinant of delta not equal to 0. So, these are linearly independent and they span the

entire vector space because you know that any vector you take, any vector you take, suppose you take any vector V I can write it as; I can write it in terms of a (Refer Time: 13:25) component. So, $V_x i$, $V_y j$ plus $V_z k$, so this vector is written as a linear combination, so V_x V_y V_z are scalars. So, you wrote this vector as a linear combination of i j and k so; that means, i j k span the entire space and i j k form a basis in this vector space.

So, they are linearly independent and they span the entire vector space, so any vector in the vector space can be written as a linear combination of i j k . So, that is in 3 dimensions. Now what I said is the maximum number of linearly independent vectors is called the basis of the vector space. So, in any vector space you can have a maximum number of linearly independent vectors and that is called the dimension. So, the maximum number of linearly independent vectors is called the dimension of the vector space.

So, you can ask the question what is the dimension. So, in the case of the 3D vector space the dimension is 3 because your number of linearly the maximum number of vectors that can be linearly independent is 3 if you have a fourth vector it will be linearly dependent. So, the basis is also the number of vectors in the basis is also gives you the dimensionality. So, you can either say maximum number of linearly independent vectors or the number of vectors in the basis. So, both are equal to the dimensionality, in 3D space you have 3 basis vectors. So, the dimensionality is 3.

(Refer Slide Time: 15:02)

The slide features the NPTEL logo on the left and the Indian Institute of Technology Bombay logo on the right. The title "Basis and Dimensionality" is centered at the top. Below the title, the text reads "Basis: Examples" and "Unit vectors in 3D space – Not unique". Handwritten in red ink are the unit vectors $\hat{i} = (1, 0, 0)$, $\hat{j} = (0, 1, 0)$, and $\hat{k} = (0, 0, 1)$. Below these, another set of vectors is shown: $\vec{b}_1 = (1, 1, 0)$, $\vec{b}_2 = (1, -1, 0)$, and $\vec{b}_3 = (0, 0, 1)$. A handwritten note in red ink states "Also a basis for 3D vector space". At the bottom, the text says "Number of vectors in basis is called DIMENSIONALITY".

So, let us take examples of basis. So, suppose you have in 3D space, so your \hat{i} ; I can write that as 1, 0, 0, \hat{j} ; I can write as 0, 1, 0, \hat{k} ; I can write it as 0, 0, 1 and what is important is that these are not unique these are not the only basis that you can have, you can have other basis also. So, for example, you can have a vector let us say b_1 equal to 1 1 0, b_2 equal to 1 minus 1 0 and b_3 equal to 0, 0, 1.

So, this is also a basis for 3D vector space. So, the basis is not unique you can have many different basis, but they should still satisfy the conditions that they should be linearly independent and you can write any vectors as a linear combination of these and you can verify that, you can write any vector as a linear combination of these linearly independent vectors.

So, for example, suppose you just take 2 of these vectors b_1 and b_2 . Now these are b_1 and b_2 are linearly independent, but I cannot express an arbitrary vector as a linear combination of b_1 and b_2 because whatever linear combination I take of b_1 and b_2 the z component will always be 0. So, 2 just b_1 and b_2 cannot form a basis you need b_1 b_2 and b_3 to form a basis. So, you need the 3 vectors to form the basis and what we said again is that the number of vectors in the basis is called the dimensionality.

(Refer Slide Time: 17:03)

Basis: Examples
Unit vectors in 3D space – Not unique
 $\hat{i} = (1, 0, 0)$ $\hat{j} = (0, 1, 0)$ $\hat{k} = (0, 0, 1)$
 $\vec{a}_1 = (1, 1, 0)$ $\vec{a}_2 = (1, -1, 0)$ $\vec{a}_3 = (0, 0, 1)$ Also a basis for 3D vector space.

Number of vectors in basis is called **DIMENSIONALITY** Dimensionality of 3D space = 3
What about vector space of functions $f(x)$

Basis and Dimensionality

So, this is so the dimensionality of 3D space by definition equal to 3. So, this is the formal definition of dimensionality and that is why we call it 3D space. Now in the last class I talked about the vector space of functions, of functions of x . So, I said that if you take the space of all functions then that is also a vector space and what is the dimensionality of that vector space.

(Refer Slide Time: 17:49)

Basis and Dimensionality

NPTEL

DIMENSIONALITY

3D vector space has dimension 3

Vector space of functions has dimensions infinity
 $f(x)$ Dimensionality = ∞

Vector Space of polynomials up to degree 2
 $a_0 + a_1x + a_2x^2$ Basis = $(1, x, x^2)$
Dimension = 3

So, vector space of functions. So, this f of x , if you want to write an arbitrary f of x as a linear combination of certain number of f of x because the space of functions is infinite

you can have infinitely many different functions. So, actually the dimension of this vector space of functions is infinity. So, dimensionality equal to infinite 3D vector space of course, has dimensionality of 3 and vector space of functions has dimensionality of infinity.

So, now you can look at some other vector spaces. So, for example, you can consider a vector space. So, we said that, so we consider the vector space of polynomials up to degree let us say 2. So, that will be that will be of the form a_0 plus $a_1 x$ plus $a_2 x^2$. So, that is what a typical polynomial will look like.

Now what is the basis for this vector space and you can convince yourselves that basis, one choice of the basis equal to 1, x , x^2 that is the obvious choice of basis because any polynomial of degree 2 I can write as something into 1 plus something into x plus something into x^2 . So, that is how we define a polynomial of degree 2. So, basis is 1, x , x^2 and the dimensionality or the dimension of this equal to 3.

So, in this way you can calculate what are the basis vectors and you can calculate the dimensionality of any vector space and the most important concept in this is that of linear independence. Now actually linear independence is probably one of the most important concepts in vector spaces and often we will be dealing with vector space of functions and you might not take all functions you might consider a certain class of functions and there the dimensionality need not be infinity it can be is lower than infinity. So, it is always keep, always these ideas of linear independence, basis and dimensionality are central to many aspects especially in quantum mechanics.

So, I will stop this lecture with this. In the next class we will talk about vector operators and functions of vectors and vectors and scalar fields.

Thank you.
