Mesh - Free Method: Space - Time Moving Least Squares Method

Welcome to lecture number 23 of the course computational hydraulics. We are in module 2, numerical methods. This unit number 19, we will cover this mesh free method. And specific topics space time moving least squares method. In our previous lecture class we have discussed only spatial discretization using or single variable discretization using moving least squares.

Dr. Anirban Dhar NPTEL Computational Hydraulics 1 / 23

In this particular unit we will try to introduce the time concept within the discretization framework. Learning objectives, at the end of this particular unit the students will be able to discretize the spatial and temporal derivatives of single valued multidimensional function using mesh free approximations. And they will be able to derive the algebraic form using discretized partial differential equation or PDE, initial condition and boundary conditions.

Learning Objectives

- To discretize the spatial and temporal derivatives of **single-valued multi-dimensional functions** using meshfree approximations.
- To derive the algebraic form using discretized PDE, IC and BCs.

in Dhar NPTEL Computational Hydraulics 2 / 23

So let us consider our general form equation in this case. We already know that if we have a general variable ϕ which is a function of x, y, z and t in our physical system where x, y, z , these three are space dimension and t is the time dimension. So first term is temporal derivative, second term is advective term, right hand side first term is your diffusion or diffusing term and this is other forces and S_{ϕ} is our source sink term.

General Equation

A form of differential equation with a general variable ϕ :

$$\frac{\partial(L_{\phi}\phi)}{\partial t^{\alpha}} + \nabla \cdot (\Upsilon_{\phi}\phi\mathbf{u}) = \nabla \cdot (\Gamma_{\phi} \cdot \nabla \phi) + F_{\phi} + S_{\phi} \quad (1)$$

where

- ϕ = general variable
- $L_{\phi}, \Upsilon_{\phi}$ = problem dependent parameters
- Γ_{ϕ} = tensor
- F_{ϕ} = other forces
- S_{ϕ} = source/sink term

$\phi(x, y, z, t)$

in Dhar NPTEL Computational Hydraulics 3 / 23

In this case capital Gamma phi and upsilon phi, these are problem dependent parameter and gamma phi these are tensors. We already know this from our previous lecture class. But in this case we need to concentrate on the temporal or spacetime discretization. In case of our

finite difference approximation, we have discretized this temporal derivative using direct approximation.

I.I.T. Kharagpur

General Equation

A form of differential equation with a general variable ϕ :

$$\frac{\partial(\Lambda_\phi \phi)}{\partial t} + \nabla \cdot (\Upsilon_\phi \phi \mathbf{u}) = \nabla \cdot (\Gamma_\phi \cdot \nabla \phi) + F_{\phi\alpha} + S_\phi \quad (1)$$

where

- ϕ = general variable
- $\Lambda_\phi, \Upsilon_\phi$ = problem dependent parameters
- Γ_ϕ = tensor
- $F_{\phi\alpha}$ = other forces
- S_ϕ = source/sink term

in Dhar NPTEL Computational Hydraulics 3 / 23

Let us say, if we have ϕ which is a constant, $\frac{\partial \phi}{\partial t}$ for three dimensional case, we can easily discretize by i, j, k and L plus 1 minus ϕ i, j, k, L divided by Δt . L and our L plus 1, these are time index for this particular discretization where we are considering that ϕ is a function of x, y, z and t . But the problem is in this case we are considering two derivatives.

General Equation

A form of differential equation with a general variable ϕ :

$$\frac{\partial(\Lambda_\phi \phi)}{\partial t} + \nabla \cdot (\Upsilon_\phi \phi \mathbf{u}) = \nabla \cdot (\Gamma_\phi \cdot \nabla \phi) + F_{\phi\alpha} + S_\phi \quad (1)$$

where

- ϕ = general variable
- $\Lambda_\phi, \Upsilon_\phi$ = problem dependent parameters
- Γ_ϕ = tensor
- $F_{\phi\alpha}$ = other forces
- S_ϕ = source/sink term

$\phi(x, y, z, t)$

$$\Lambda_\phi \frac{\partial \phi}{\partial t} = \frac{\phi_{i,j,k}^{l+1} - \phi_{i,j,k}^l}{\Delta t}$$

in Dhar NPTEL Computational Hydraulics 3 / 23

If you have one dimensional case then we have simply x and t in time dimension. Then if this is our time level L and this is our time level L plus 1, then for any particular space level i , we

can calculate this derivative where $\frac{\partial \phi}{\partial t}$ equals to $\phi_{iL+1} - \phi_{iL}$ and this is divided by Δt .

(Refer Slide Time 06:03)

General Equation

A form of differential equation with a general variable ϕ :

$$\frac{\partial(\Lambda_\phi \phi)}{\partial t} + \nabla \cdot (\Upsilon_\phi \phi \mathbf{u}) = \nabla \cdot (\Gamma_\phi \cdot \nabla \phi) + F_{\phi_o} + S_\phi \quad (1)$$

where

- ϕ = general variable
- $\Lambda_\phi, \Upsilon_\phi$ = problem dependent parameters
- Γ_ϕ = tensor
- F_{ϕ_o} = other forces
- S_ϕ = source/sink term

Handwritten notes on the slide:

- $\phi(x, y, z, t)$
- $\Delta_\phi \frac{\partial \phi}{\partial t} = \frac{\phi_{i,j,k}^{t+1} - \phi_{i,j,k}^t}{\Delta t}$
- $\frac{\partial \phi}{\partial t} = \frac{\phi_i^{t+1} - \phi_i^t}{\Delta t}$
- A 3D coordinate system with axes x, y, z and a point i .

Dr. Anirban Dhar NPTEL Computational Hydraulics 3 / 23

When there is increase in the number of dimensions we are considering two points. One at the future time level $L + 1$, another one at present time level L . Now in this case if we consider as you two dimensional consideration or discretization, the same thing we are repeating. We are considering that in this case if we have this time axis and these two are x and y , this is our time axis.

Then for discretization if this is level L for any arbitrary point this one we can start our discretization and we will consider one in present, another one in future. So in finite difference case we are considering two points, one is in present, another one is in future.

in Dhar NPTEL Computational Hydraulics 3 / 23

But the concept of mesh free is such that we need to consider the concept of support domain. Now whenever we are considering this support domain we need to specify some radius for that one. So whenever we are specifying radius for any system, let us say this is one dimensional x and t system. So if you have different points at different levels, maybe if we move in this direction there will be increase in t, if we move rightward obviously there will be increase in x.

So we need to define the radius for this influence domain or support domain. Now wherever we are considering the central point, maybe this point is our central point.

(Refer Slide Time 08:48)

I.I.T. Kharagpur

General Equation

A form of differential equation with a general variable ϕ :

$$\frac{\partial(\Lambda_\phi \phi)}{\partial t} + \nabla \cdot (\Upsilon_\phi \phi \mathbf{u}) = \nabla \cdot (\Gamma_\phi \cdot \nabla \phi) + F_{\phi_o} + S_\phi \quad (1)$$

where

- ϕ = general variable
- $\Lambda_\phi, \Upsilon_\phi$ = problem dependent parameters
- Γ_ϕ = tensor
- F_{ϕ_o} = other forces
- S_ϕ = source/sink term

in Dhar NPTEL Computational Hydraulics 3 / 23

So if we consider this support domain we may need to consider multiple points at present and future time level in this case for calculation of derivatives. So the concept of mesh free and finite difference is similar. Only difference is that we are considering multiple number of points in this case.

Dr. Anirban Dhar NPTEL Computational Hydraulics 3 / 23

So now we can explain the reduced form that we have utilized in our finite difference approximations where governing equation is for IBVP or initial boundary value problem where this lambda phi is constant. These gamma x, gamma y, these are also constant. And Sphi is somewhat specified quantity for any physical problem. Now with this information we can start our problem.

(Refer Slide Time 10:23)

Problem Definition
Variable Definition
Space-time Moving Least Squares Method
References

I.I.T. Kharagpur

Problem Definition

Governing equation

A two-dimensional (in space) IBVP can be written as,

$$\Omega : \Lambda_\phi \frac{\partial \phi}{\partial t} - \Gamma_x \frac{\partial^2 \phi}{\partial x^2} + \Gamma_y \frac{\partial^2 \phi}{\partial y^2} + S_\phi(x, y)$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 4 / 23

And if you see the initial condition, initial condition again phi is a function of x, y and at t equals to zero, we need to specify the value of phi which is phi0 and it's varying over x and y. And boundary condition, on the left side we have specified boundary or this is Dirichlet kind of boundary condition, D1, D2. And if we have on top in this case, this is Neumann and this bottom also we have Neumann kind of boundary condition.

(Refer Slide Time 11:23)

Problem Definition

subject to

Initial Condition

$$\phi(x, y, 0) = \phi_0(x, y)$$

and

Boundary Condition

$$\Gamma_D^1: \phi(0, y, t) = \phi_1$$

$$\Gamma_D^2: \phi(L_x, y, t) = \phi_2$$

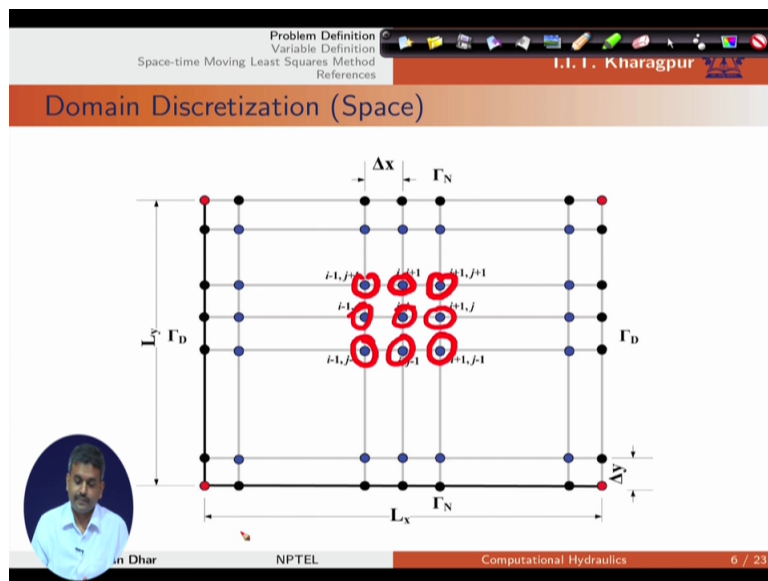

$$\Gamma_N^3: \left. \frac{\partial \phi}{\partial y} \right|_{(x, 0, t)} = 0$$

$$\Gamma_N^4: \left. \frac{\partial \phi}{\partial y} \right|_{(x, L_y, t)} = 0$$

5 / 23

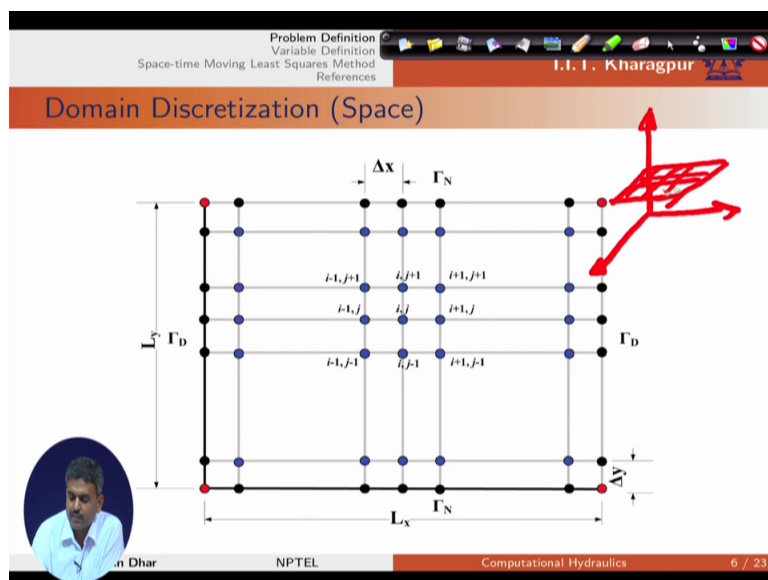

Now we need to discretize this derivatives or equations using our mesh free approximation approach. So again we can discretize our spatial domain into regular individual points. Because these lines or these grid lines are not applicable for our mesh free approximations. We will consider only individual points for our calculation purpose. These points can be either in structured or placed in regular intervals or they are randomly distributed within this domain.

(Refer Slide Time 12:22)

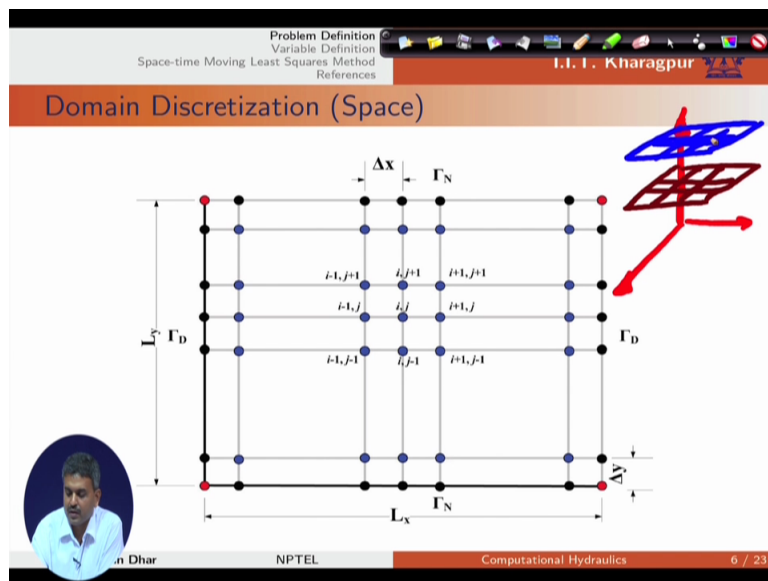

So we will have number of points within the domain and certain number of points will be there at the boundary. So for our governing equation we need to select the interior points. And for boundary nodes we need to apply our boundary conditions. So this is all about space discretization. Now we need to consider different levels as we have considered in our finite difference for implicit, explicit and Crank Nicolson scheme. So we will have different time slices.

(Refer Slide Time 13:22)

And for that we need to consider we will have different time slices here. And there will be another slice on top of this one. Let us say this is another one.

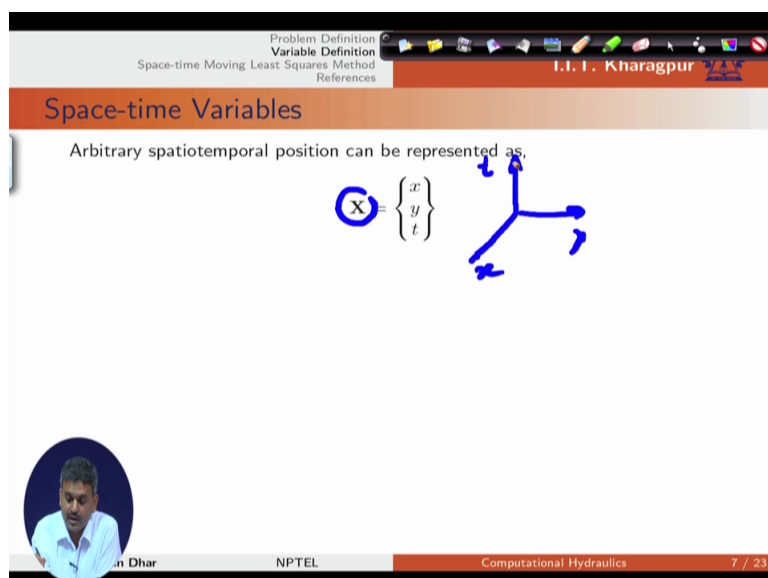

(Refer Slide Time 13:52)

So between these two we need to apply the theory or maybe there will be inclusion of multiple time slices in a particular calculation. So it all depends on our temporal influence domain definition. If we define the temporal influence with higher value, obviously we need to consider multiple time levels

Now let us define our space time variable. Let us say this capital X, we are defining it with arbitrary spatial position x, y, d . This is applicable for two dimensional in space and one dimensional in time.

(Refer Slide Time 15:16)

Let us define spatial temporal variable \tilde{X}_i . And in this case \tilde{X}_i represents the difference between this point this \tilde{X}_i specifically represents the difference of the spatial position with respect to any arbitrary variable x, y, t in this case. So $x_i - x, y_i - y$ and $t_i - t$ in this case.

(Refer Slide Time 16:02)

Problem Definition
Variable Definition
Space-time Moving Least Squares Method
References

I.I.T. Kharagpur

Space-time Variables

Arbitrary spatiotemporal position can be represented as,

$$\mathbf{X} = \begin{Bmatrix} x \\ y \\ t \end{Bmatrix}$$

Let us define a spatiotemporal (2D in space) variable \tilde{X}_i as,

$$\tilde{X}_i = \begin{Bmatrix} \tilde{x}_i \\ \tilde{y}_i \\ \tilde{t}_i \end{Bmatrix} = \begin{Bmatrix} x_i - x \\ y_i - y \\ t_i - t \end{Bmatrix}$$

Dr. Anirban I NPTEL Computational Hydraulics 7 / 23

So if we apply it for Taylor series expansion, so obviously for any general variable ϕ this can be written where this is our column vector. Now in this case we can have this is our Jacobian and this is our Asian matrix. Now this $\phi(x_i)$, if we write it as $\phi(x) + x_i - x$. So we can write this next to values that is $x_i - x$ with this \tilde{X}_i .

(Refer Slide Time 17:18)

Problem Definition
Variable Definition
Space-time Moving Least Squares Method

I.I.T. Kharagpur

Space-time Variables

Arbitrary spatiotemporal position can be represented as,

$$\mathbf{X} = \begin{Bmatrix} x \\ y \\ t \end{Bmatrix}$$

Let us define a spatiotemporal (2D in space) variable \tilde{X}_i as,

$$\tilde{X}_i = \begin{Bmatrix} \tilde{x}_i \\ \tilde{y}_i \\ \tilde{t}_i \end{Bmatrix} = \begin{Bmatrix} x_i - x \\ y_i - y \\ t_i - t \end{Bmatrix}$$

Taylor series expansion of any general variable ϕ can be written as,

$$\phi(\mathbf{X}_i) = \phi(\mathbf{X} + \tilde{X}_i) = \phi(\mathbf{X}) + (\mathbf{X} + \tilde{X}_i - \mathbf{X})$$

$$= \phi(\mathbf{X}) + \begin{bmatrix} \frac{\partial \phi}{\partial x} & \frac{\partial \phi}{\partial y} & \frac{\partial \phi}{\partial t} \end{bmatrix} \tilde{X}_i + \frac{1}{2!} \tilde{X}_i^T \begin{bmatrix} \frac{\partial^2 \phi}{\partial x^2} & \frac{\partial^2 \phi}{\partial x \partial y} & \frac{\partial^2 \phi}{\partial x \partial t} \\ \frac{\partial^2 \phi}{\partial y \partial x} & \frac{\partial^2 \phi}{\partial y^2} & \frac{\partial^2 \phi}{\partial y \partial t} \\ \frac{\partial^2 \phi}{\partial t \partial x} & \frac{\partial^2 \phi}{\partial t \partial y} & \frac{\partial^2 \phi}{\partial t^2} \end{bmatrix} \tilde{X}_i + \dots$$

Dr. Anirban I NPTEL Computational Hydraulics 7 / 23

And \tilde{x}_i is our increment from x plus this x_i . So let us expand it with respect to x . For any arbitrary $\phi(x, y, t)$, there will be $\frac{\partial \phi}{\partial x}$, $\frac{\partial \phi}{\partial y}$, $\frac{\partial \phi}{\partial t}$. So these three terms will be there. And in Asian matrix nine terms will be there to consider the temporal variation.

Now we can utilize this for our calculations. So in space time polynomial basis we can write in terms of $1, \tilde{x}_i, \tilde{y}_i, \tilde{t}_i$. Obviously \tilde{x}_i , individually this is our $x_i - x$. Similarly for other terms and others are $\tilde{x}_i^2, \tilde{y}_i^2, \tilde{t}_i^2, \tilde{x}_i \tilde{y}_i, \tilde{y}_i \tilde{t}_i, \tilde{x}_i \tilde{t}_i$. So these terms will be there.

(Refer Slide Time 19:18)

Problem Definition
Variable Definition

I.I.T. Kharagpur

Space-time Variables

Space-time polynomial basis can be written as,

$$p(\tilde{X}_i) = [1 \quad \tilde{x}_i \quad \tilde{y}_i \quad \tilde{t}_i \quad \tilde{x}_i^2 \quad \tilde{y}_i^2 \quad \tilde{t}_i^2 \quad \tilde{x}_i\tilde{y}_i \quad \tilde{y}_i\tilde{t}_i \quad \tilde{t}_i\tilde{x}_i]^T$$

a(X) can be written as,

$$a(X) = \left[\phi \quad \frac{\partial\phi}{\partial x} \quad \frac{\partial\phi}{\partial y} \quad \frac{\partial\phi}{\partial t} \quad \frac{1}{2!} \frac{\partial^2\phi}{\partial x^2} \quad \frac{1}{2!} \frac{\partial^2\phi}{\partial y^2} \quad \frac{1}{2!} \frac{\partial^2\phi}{\partial t^2} \quad \frac{\partial^2\phi}{\partial x\partial y} \quad \frac{\partial^2\phi}{\partial y\partial t} \quad \frac{\partial^2\phi}{\partial t\partial x} \right]^T$$

in Dhar NPTEL Computational Hydraulics 8 / 23

Now let us utilize this for construction of mesh free method. Now phi can be estimated from this one. So if you multiply this P transpose, this is actually our column vector. So this is actually column vector.

(Refer Slide Time 21:09)

Problem Definition
Variable Definition
Space-time Moving Least Squares Method
References

I.I.T. Kharagpur

Space-time Variables

Space-time polynomial basis can be written as,

$$\mathbf{p}(\tilde{\mathbf{X}}_i) = [1 \quad \tilde{x}_i \quad \tilde{y}_i \quad \tilde{t}_i \quad \tilde{x}_i^2 \quad \tilde{y}_i^2 \quad \tilde{t}_i^2 \quad \tilde{x}_i\tilde{y}_i \quad \tilde{y}_i\tilde{t}_i \quad \tilde{t}_i\tilde{x}_i]^T$$

$\mathbf{a}(\mathbf{X})$ can be written as,

$$\mathbf{a}(\mathbf{X}) = \left[\phi \quad \frac{\partial \phi}{\partial x} \quad \frac{\partial \phi}{\partial y} \quad \frac{\partial \phi}{\partial t} \quad \frac{1}{2!} \frac{\partial^2 \phi}{\partial x^2} \quad \frac{1}{2!} \frac{\partial^2 \phi}{\partial y^2} \quad \frac{1}{2!} \frac{\partial^2 \phi}{\partial t^2} \quad \frac{\partial^2 \phi}{\partial x \partial y} \quad \frac{\partial^2 \phi}{\partial y \partial t} \quad \frac{\partial^2 \phi}{\partial t \partial x} \right]^T$$

Estimated ϕ can be calculated as,

$$\phi^{est}(\mathbf{X}_i) = \mathbf{p}^T(\tilde{\mathbf{X}}_i)\mathbf{a}(\mathbf{X})$$

in Dhar NPTEL Computational Hydraulics 8 / 23

So P transpose will be here, row vector and individually this will be again a column vector in this case. So we can get the mix terms and we can estimate this phi from this calculation.

(Refer Slide Time 21:35)

I.I.T. Kharagpur

Space-time Moving Least Squares Method

Weighted Residual

Weighted Residual can be calculated as,

$$J = \sum_{i=1}^{N_s} \omega(\mathbf{X}_i - \mathbf{X}) [\phi^{est}(\mathbf{X}, \mathbf{X}_i) - \phi(\mathbf{X}_i)]^2$$

an Dhar NPTEL Computational Hydraulics 9 / 23

So if we further write it in terms of our polynomial basis, \mathbf{x}, ϕ_i and this is our weighting function.

(Refer Slide Time 22:42)

Problem Definition
Variable Definition
Space-time Moving Least Squares Method
References

I.I.T. Kharagpur

Space-time Moving Least Squares Method

Weighted Residual

Weighted Residual can be calculated as,

$$J = \sum_{i=1}^{N_s} \omega(\mathbf{X}_i - \mathbf{X}) [\phi^{est}(\mathbf{X}, \mathbf{X}_i) - \phi(\mathbf{X}_i)]^2$$

or,

$$J = \sum_{i=1}^{N_s} \omega(\mathbf{X}_i - \mathbf{X}) [\mathbf{p}^T(\mathbf{X}_i) \mathbf{a}(\mathbf{X}) - \phi(\mathbf{X}_i)]^2$$

where $\omega(\mathbf{X}_i - \mathbf{X})$ is a weighting function.

an Dhar NPTEL Computational Hydraulics 9 / 23

Now let us say this \mathbf{J} in matrix form this can be written with the help of \mathbf{P} . Now we need to construct this \mathbf{P} with the help of polynomial basis. \mathbf{A} , we already know that is our derivative related function. And ϕ^T is again our ϕ_1, ϕ_2 to ϕ_{N_s} , number of points will be there.

(Refer Slide Time 23:22)

Problem Definition
Variable Definition
Space-time Moving Least Squares Method
References
I.I.T. Kharagpur

Space-time Moving Least Squares Method

In matrix form,

$$J = (\Phi^T - \phi)^T \omega (\mathbf{Pa} - \phi)$$

where

$$\phi^T = \{\phi_1 \phi_2 \dots \phi_{N_s}\}$$

in Dhar NPTEL Computational Hydraulics 10 / 23

Now if we consider P, so we need to consider n number of points including the zero. So zero plus m, some plus 1 number of basis things will be there. And we have n number of points in this case or Ns is the total number. So in this case we can write our P explicitly in terms of that tilde variable that is p0 is essentially constant 1, p1 is x0, p2 will be y0, p3 will be t0 tilde, like that.

(Refer Slide Time 24:29)

Problem Definition

Space-time Moving Least Squares Method

$$\omega(\mathbf{X}) = \begin{bmatrix} \omega(\bar{x}_0, \bar{y}_0, \bar{t}_0) & 0 & \dots & 0 \\ 0 & \omega(\bar{x}_1, \bar{y}_1, \bar{t}_1) & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & \omega(\bar{x}_n, \bar{y}_n, \bar{t}_n) \end{bmatrix} \quad \text{---}$$

in Dhar NPTEL Computational Hydraulics 11 / 23

In this case we will have this J, Ax, A, Bx phi where Ax, A, Bx phi we need to calculate. And A and B can be calculated based on omega and P value. And B again this can be calculated from P transpose this omega x. And further this Ax can be calculated directly from A inverse B, from this particular equation or expression.

Space-time Moving Least Squares Method

Minimization condition requires,

$$\frac{\partial J}{\partial \mathbf{a}} = \mathbf{A}(\mathbf{X})\mathbf{a}(\mathbf{X}) - \mathbf{B}(\mathbf{X})\phi = 0$$

Thus, linear system of equations can be written as,

$$\mathbf{A}(\mathbf{X})\mathbf{a}(\mathbf{X}) = \mathbf{B}(\mathbf{X})\phi$$

where

$$\mathbf{A} = \mathbf{P}^T \omega(\mathbf{X}) \mathbf{P}$$

$$\mathbf{B} = \mathbf{P}^T \omega(\mathbf{X})$$

$\mathbf{a}(\mathbf{X})$ can be calculated as,

$$\mathbf{a}(\mathbf{X}) = \mathbf{A}^{-1}(\mathbf{X})\mathbf{B}(\mathbf{X})\phi$$

in Dhar NPTEL Computational Hydraulics 12 / 23

So minimization condition, we need to equate it with a zero. From that we are getting the next level expression which can be further calculated explicitly with polynomial basis. And Ax A inverse Bx phi, this can be calculated with the help of A and B.

Dr. Anirban Dhar NPTEL Computational Hydraulics 12 / 23

Now in this one space time moving least squares method, we have expressed A in terms of A inverse B phi. So left hand side we have derivative and right hand side we have our defined terms. Now with the help of this we can get the derivative values.

Space-time Moving Least Squares Method

$$\left\{ \begin{array}{l} \phi \\ \frac{\partial \phi}{\partial x} \\ \frac{\partial \phi}{\partial y} \\ \frac{\partial \phi}{\partial t} \\ \frac{1}{2!} \frac{\partial^2 \phi}{\partial x^2} \\ \frac{1}{2!} \frac{\partial^2 \phi}{\partial y^2} \\ \frac{1}{2!} \frac{\partial^2 \phi}{\partial t^2} \\ \frac{\partial^2 \phi}{\partial x \partial y} \\ \frac{\partial^2 \phi}{\partial y \partial t} \\ \frac{\partial^2 \phi}{\partial t \partial x} \end{array} \right\} = \mathbf{A}^{-1}(\mathbf{X})\mathbf{B}(\mathbf{X})\phi$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 13 / 23

Now we need to define our weight function, this weight function can be calculated or from the exponential function. This sigma X, this is our weight function support. So beyond this support domain this value is zero. Otherwise this is continuous within the support domain and it is varying within the support domain.

Weight Function (Sophy et al., 2012)

$$\omega(\tilde{\mathbf{X}}_i) = \begin{cases} \text{Exp} \left[-3\ln(10) \left(\frac{\|\tilde{\mathbf{X}}_i\|^2}{[\sigma(\mathbf{X})]^2} \right) \right] & \text{if } \|\tilde{\mathbf{X}}_i\|^2 < [\sigma(\mathbf{X})]^2 \\ 0 & \text{if } \|\tilde{\mathbf{X}}_i\|^2 \geq [\sigma(\mathbf{X})]^2 \end{cases}$$

$\sigma(\mathbf{X})$ is weight function support. The corrected norm can be written as,

$$\|\tilde{\mathbf{X}}_i\|_c = \sqrt{\left(\frac{\tilde{x}_i}{c_x}\right)^2 + \left(\frac{\tilde{y}_i}{c_y}\right)^2 + \left(\frac{\tilde{t}_i}{c_t}\right)^2}$$

an Dhar NPTEL Computational Hydraulics 14 / 23

Now we can further correct the norm. This is directly calculated norm but the problem is, due to the order changes in x and x, y and t, it may create problem in the weight function definition. So we can scale it with C_x , C_y and C_t values and we can correct the norm. And we can utilize this particular norm for our weight function calculation.

an Dhar NPTEL Computational Hydraulics 14 / 23

So we need to consider the influence domain. Let us say we have xt domain where it is one dimensional in space, one dimensional in time. So if we consider a particular time level which is xt domain, we can see that to calculate that we are considering multiple points. If we move on the left ward side that is with change in space values. Right ward side change is only

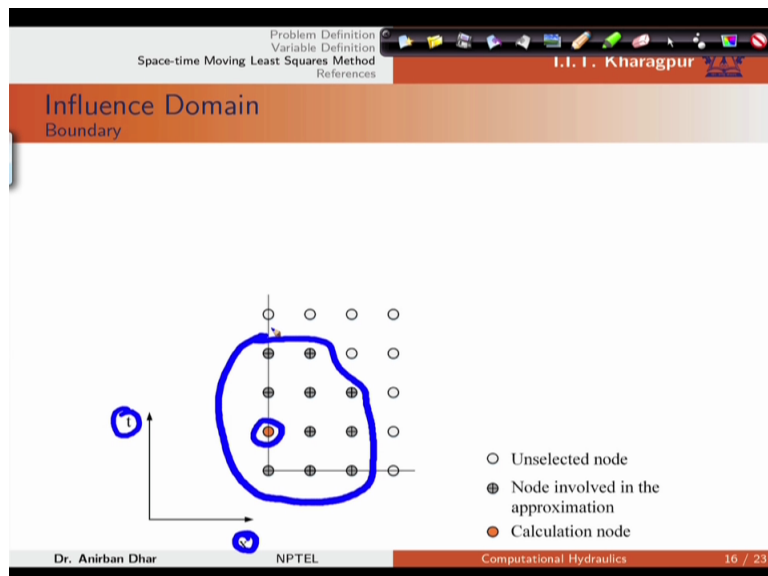

space values. But if we move upward or downward there is change in the time values. So different time levels are incorporated in this calculation process.

(Refer Slide Time 29:17)

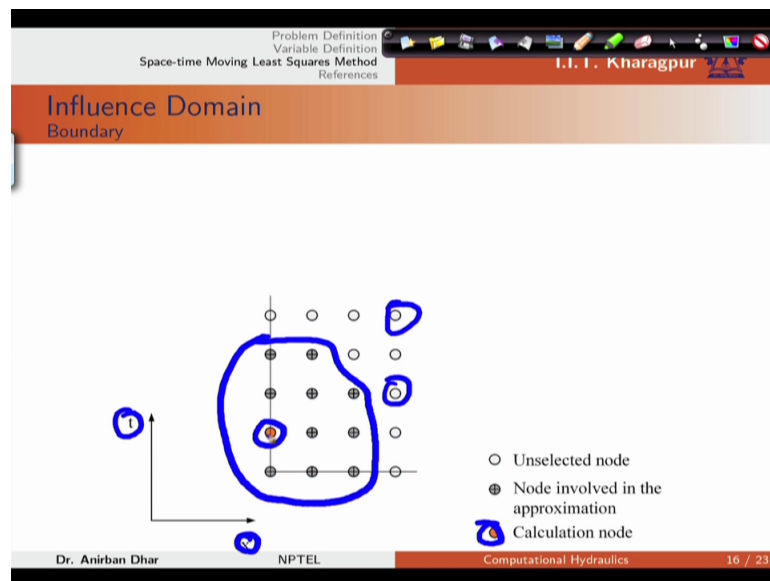

Now we need to define influence domain for boundary. If we have this xt problem where x is one dimensional and t is one dimensional then on t axis some point is there, sonodes involved in approximation will consider like this.

(Refer Slide Time 29:52)

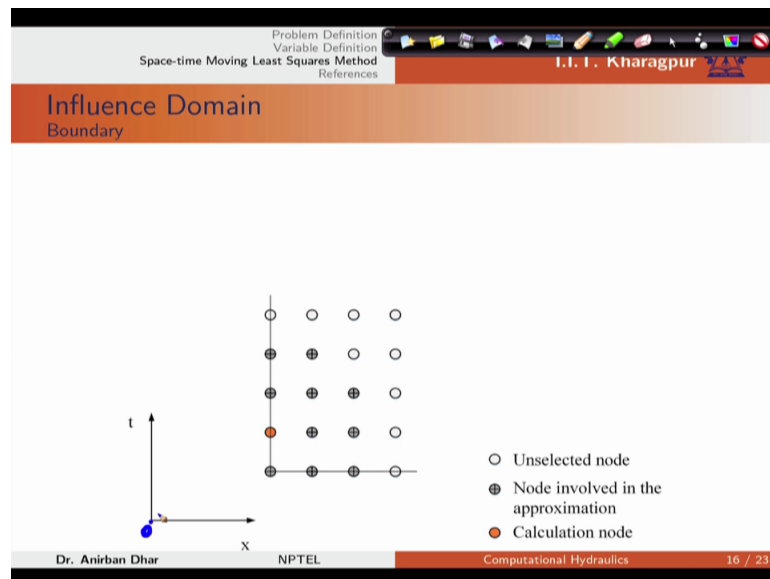

And these open circles are unselected nodes. So this orange color node is our calculation node.

(Refer Slide Time 30:01)

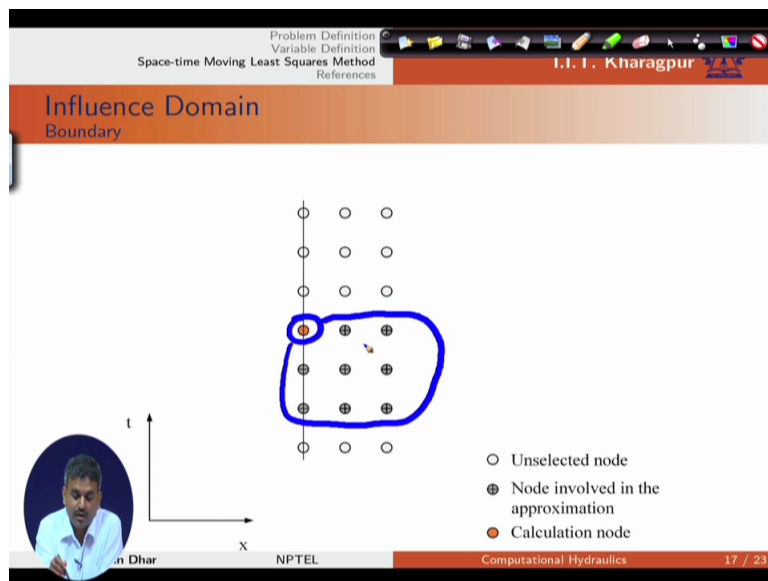

Similarly this is the extreme case where we have a zero-zero point available here. Time is starting from zero and space is also starting from zero.

(Refer Slide Time 30:17)

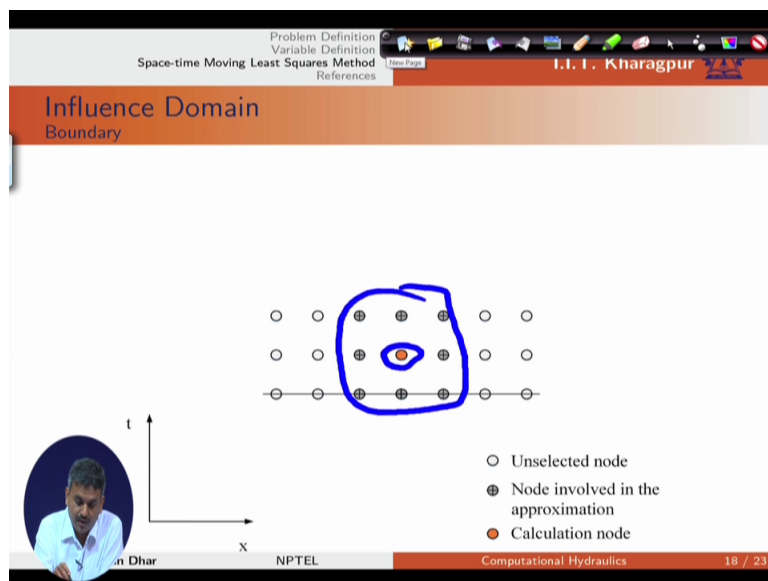

Now if we have another case where time is zero but our x is zero, but time is not zero. So it's on t axis. But we are considering multiple time levels. So for that calculation we will consider only previous or past time levels and the present time level values, not at the future time level.

(Refer Slide Time 30:52)

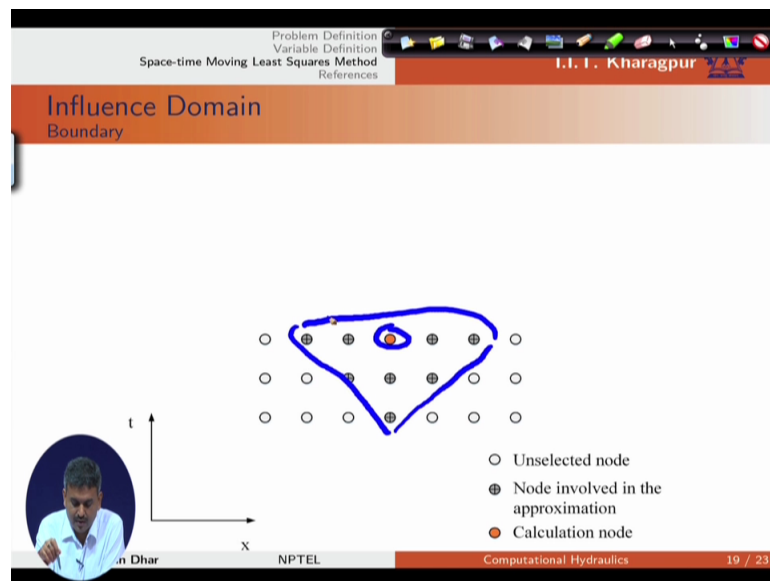

Now next level consideration. If you have zero time level and there is variation in x , so for a point which is near to boundary or space level and immediate next time level, we need to consider both future and present level time nodes.

(Refer Slide Time 31:25)

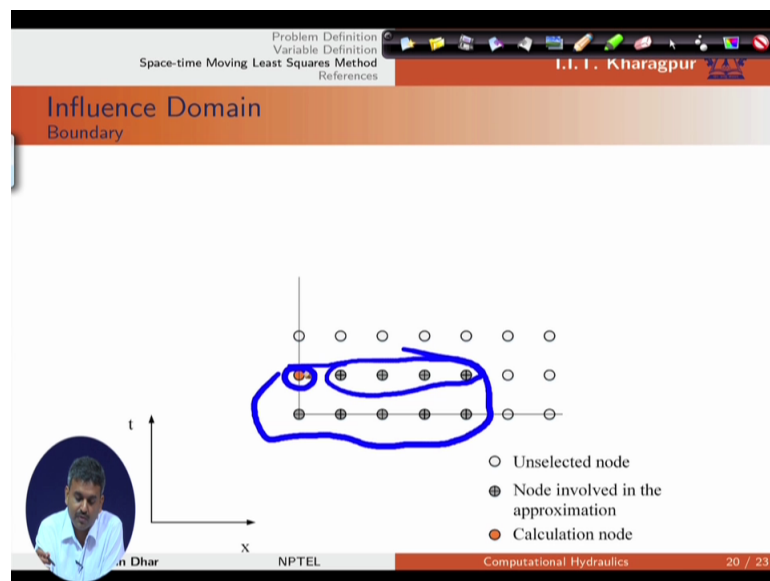

If we have in between other cases we can define our node like this. This triangular kind of configuration will be there for intermediate cases or internal cases.

(Refer Slide Time 31:48)

Again this is for one boundary. We can select all boundary points and just immediately next level time values for this calculation.

(Refer Slide Time 32:20)

So you can see that influence domain is important in case of space time moving least squares. We need to define the nodes that we need to consider during our calculation process. So depending on that there will be change in the size of matrix. It may be the banded matrix or exclude one or it's a full matrix. Not a full matrix because multiple number of points will be there which are unselected nodes. So we need not to consider the influence of those points.

So with this we can start the approximation and we can solve the problem using mesh free. With this lecture we are finishing our discretization process. Now next lecture onwards we will consider our solution process that is solution of our $A \phi = r$ matrix that we have generated from our finite difference, finite volume and mesh free approximations.
