Lecture 27
Algebraic Equation: Tri-Diagonal Matrix Method

Welcome to this lecture number 27 of the course computational hydraulics. We are in module 2, numerical methods. In this particular unit number 23 we will be discussing tridiagonal matrix method. This comes under algebraic equations.

(Refer Slide Time 00:28)

Forward Elimination
Backward Substitution

Module 02: Numerical Methods
Unit 23: Algebraic Equation: TriDiagonal Matrix Method

Anirban Dhar
Department of Civil Engineering
Indian Institute of Technology Kharagpur, Kharagpur
National Programme for Technology Enhanced Learning (NPTEL)

Dr. Anirban Dhar NPTEL Computational Hydraulics 1 / 20

Now what is the learning objective for this particular unit? To apply tridiagonal matrix algorithm for direct solution of matrixes. Specifically we will be discussing special kind of matrix that is tridiagonal banded matrix for this particular lecture class.

(Refer Slide Time 02:32)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Basic Form

$$\begin{pmatrix} \times & \times & & & \\ \times & \times & \times & & \\ & \times & \times & \times & \\ & & \ddots & \ddots & \ddots \\ & & & \times & \times & \times \\ & & & & \times & \times \\ & & & & & \times & \times \\ & & & & & & \times & \times \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \vdots \\ \phi_{N-2} \\ \phi_{N-1} \\ \phi_N \end{pmatrix} = \begin{pmatrix} r_1 \\ r_2 \\ r_3 \\ \vdots \\ r_{N-2} \\ r_{N-1} \\ r_N \end{pmatrix}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 3 / 20

So if it is N by N total matrix. Now we can divide this A matrix into three different column vectors. So how is this possible? In diagonal term we will have N values. So let us say we have N cross 1 column vector. Another one is for lower one. Although we know that this value is dummy value.

(Refer Slide Time 03:19)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Basic Form

$$\begin{pmatrix} \times & \times & & & \\ \times & \times & \times & & \\ & \times & \times & \times & \\ & & \ddots & \ddots & \ddots \\ & & & \times & \times & \times \\ & & & & \times & \times \\ & & & & & \times & \times \\ & & & & & & \times & \times \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \vdots \\ \phi_{N-2} \\ \phi_{N-1} \\ \phi_N \end{pmatrix} = \begin{pmatrix} r_1 \\ r_2 \\ r_3 \\ \vdots \\ r_{N-2} \\ r_{N-1} \\ r_N \end{pmatrix}$$

N x 1

Dr. Anirban Dhar NPTEL Computational Hydraulics 3 / 20

To keep the size consistent with the diagonal term we will store this one extra value here, N cross N, N cross 1. So maybe if we consider this for lower one, this is for middle one and this is for upper one. So let us say we are defining it with a diagonal term and below diagonal term and above diagonal term. And now we need to store this phi and r as usual because these

are required for our calculation process. Only we will concentrate on the matrix A and we will try to reduce the storage requirements for matrix A in this case.

(Refer Slide Time 04:29)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Basic Form

$$A \phi = r$$

$$\begin{pmatrix} \times & \times & \times & \times & \times \\ \times & \times & \times & \times & \times \\ \times & \times & \times & \times & \times \\ \times & \times & \times & \times & \times \\ \times & \times & \times & \times & \times \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \vdots \\ \phi_{N-2} \\ \phi_{N-1} \\ \phi_N \end{pmatrix} = \begin{pmatrix} r_1 \\ r_2 \\ r_3 \\ \vdots \\ r_{N-2} \\ r_{N-1} \\ r_N \end{pmatrix}$$

$N \times N$ $N \times 1$ $N \times 1$

Handwritten notes: $b \ d \ a$ (top right), $N \times 1$ (below matrix)

Dr. Anirban Dhar NPTEL Computational Hydraulics 3 / 20

Now like our Gauss elimination we will have this 5 by 5 matrix, sum example one. This is below term. So essentially if we write this b_1 , b_1 is zero. At the same time if we consider a_5 , obviously a_5 will be zero in our calculation. But d_1 to d_5 will be there for our calculation process. So ϕ , these are as usual.

(Refer Slide Time 05:29)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{pmatrix} d_1 & a_1 & 0 & 0 & 0 \\ b_2 & d_2 & a_2 & 0 & 0 \\ 0 & b_3 & d_3 & a_3 & 0 \\ 0 & 0 & b_4 & d_4 & a_4 \\ 0 & 0 & 0 & b_5 & d_5 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} r_1 \\ r_2 \\ r_3 \\ r_4 \\ r_5 \end{pmatrix}$$

Handwritten notes: $a_5 = 0$ (top), $b_1 = 0$ (left), b_5 (below matrix)

Dr. Anirban Dhar NPTEL Computational Hydraulics 4 / 20

Now let us say that we are starting our calculation with row 1. Row 1 what is required? We have d_1 , ϕ_1 , d_1 multiplied with ϕ_1 , a_1 multiplied with ϕ_2 and r_1 is there. So with this if we write $d_1 \phi_1$ plus $a_1 \phi_2$ equals to r_1 .

(Refer Slide Time 06:10)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{pmatrix} d_1 & a_1 & 0 & 0 & 0 \\ b_2 & d_2 & a_2 & 0 & 0 \\ 0 & b_3 & d_3 & a_3 & 0 \\ 0 & 0 & b_4 & d_4 & a_4 \\ 0 & 0 & 0 & b_5 & d_5 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} r_1 \\ r_2 \\ r_3 \\ r_4 \\ r_5 \end{pmatrix}$$

Row 1

$$d_1 \phi_1 + a_1 \phi_2 = r_1$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 4 / 20

Then we can straight way divide this d_1 , this is ϕ_1 plus a_1 by d_1 and r_1 by d_1 . These are some initial values. But interesting thing is that we are using the storage structure for b_1 to b_5 , d_1 to d_5 and a_1 to a_5 . So in first case we can define it with a new variable.

(Refer Slide Time 07:13)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{pmatrix} d_1 & a_1 & 0 & 0 & 0 \\ b_2 & d_2 & a_2 & 0 & 0 \\ 0 & b_3 & d_3 & a_3 & 0 \\ 0 & 0 & b_4 & d_4 & a_4 \\ 0 & 0 & 0 & b_5 & d_5 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} r_1 \\ r_2 \\ r_3 \\ r_4 \\ r_5 \end{pmatrix}$$

Row 1

$$d_1 \phi_1 + a_1 \phi_2 = r_1$$

Division by d_1 yields

$$\phi_1 + \frac{a_1}{d_1} \phi_2 = \frac{r_1}{d_1}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 4 / 20

Otherwise we can store a_1 , this equals to a_1 . So a_1 equals to a_1 divided by d_1 and r_1 equals to r_1 divided by d_1 .

(Refer Slide Time 07:48)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{pmatrix} d_1 & a_1 & 0 & 0 & 0 \\ b_2 & d_2 & a_2 & 0 & 0 \\ 0 & b_3 & d_3 & a_3 & 0 \\ 0 & 0 & b_4 & d_4 & a_4 \\ 0 & 0 & 0 & b_5 & d_5 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} r_1 \\ r_2 \\ r_3 \\ r_4 \\ r_5 \end{pmatrix}$$

Row 1

Division by d_1 yields

$$d_1\phi_1 + a_1\phi_2 = r_1$$

$$\phi_1 + \frac{a_1}{d_1}\phi_2 = \frac{r_1}{d_1}$$

Handwritten notes in red: $a_1 = r_1/d_1$, $r_1 = r_1/d_1$

Dr. Anirban Dhar NPTEL Computational Hydraulics 4 / 20

Now in this case rewriting we can see that if we define new variables ξ_1 and ρ_1 , we can rewrite our first row.

(Refer Slide Time 08:04)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{pmatrix} d_1 & a_1 & 0 & 0 & 0 \\ b_2 & d_2 & a_2 & 0 & 0 \\ 0 & b_3 & d_3 & a_3 & 0 \\ 0 & 0 & b_4 & d_4 & a_4 \\ 0 & 0 & 0 & b_5 & d_5 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} r_1 \\ r_2 \\ r_3 \\ r_4 \\ r_5 \end{pmatrix}$$

Row 1

Division by d_1 yields

$$d_1\phi_1 + a_1\phi_2 = r_1$$

$$\phi_1 + \frac{a_1}{d_1}\phi_2 = \frac{r_1}{d_1}$$

Rewriting yields

$$\phi_1 + \xi_1\phi_2 = \rho_1$$

with

$$\xi_1 = \frac{a_1}{d_1}, \quad \rho_1 = \frac{r_1}{d_1}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 4 / 20

So this thing we have changed. So we have converted our diagonal term to unity and we have changed our off diagonal term. Obviously we cannot change b , we have changed only a and ρ .

(Refer Slide Time 08:25)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{pmatrix} 1 & \xi_1 & 0 & 0 & 0 \\ b_2 & d_2 & a_2 & 0 & 0 \\ 0 & b_3 & d_3 & a_3 & 0 \\ 0 & 0 & b_4 & d_4 & a_4 \\ 0 & 0 & 0 & b_5 & d_5 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} \rho_1 \\ r_2 \\ r_3 \\ r_4 \\ r_5 \end{pmatrix}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 5 / 20

Now in this case if we consider rho by multiplying b2 with row 1. Now remember that in Gauss elimination we have used unchanged or undisturbed row1 in our calculation process. But in this tridiagonal algorithm we are using same forward elimination, but we are multiplying this quantity with disturbed one because we have changed our first row. So we are multiplying row 1 with b2.

(Refer Slide Time 09:27)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{pmatrix} 1 & \xi_1 & 0 & 0 & 0 \\ b_2 & d_2 & a_2 & 0 & 0 \\ 0 & b_3 & d_3 & a_3 & 0 \\ 0 & 0 & b_4 & d_4 & a_4 \\ 0 & 0 & 0 & b_5 & d_5 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} \rho_1 \\ r_2 \\ r_3 \\ r_4 \\ r_5 \end{pmatrix}$$

Row 2
 $b_2\phi_1 + d_2\phi_2 + a_2\phi_3 = r_2$

Multiplying b_2 with Row 1

$$b_2 \times (\phi_1 + \xi_1\phi_2 = \rho_1)$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 5 / 20

And again we can write b2 into phi1. This is d2 phi2, a2 phi3, r2. And this is our b2 into row 1. This is b2 because diagonal term is 1. So no coefficients are there. So simply we are multiplying b2. And b2 into xi1, this quantity is there as coefficient of phi2, equals to b2 into rho1. Now b2 into rho1, this is important term.

(Refer Slide Time 10:15)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{array}{r|l}
 \text{Row 2} & b_2\phi_1 + d_2\phi_2 + a_2\phi_3 = r_2 \\
 b_2 \times \text{Row 1} & b_2\phi_1 + b_2\xi_1\phi_2 = b_2\rho_1 \\
 \hline
 \text{Updated Row 2} & (d_2 - b_2\xi_1)\phi_2 + a_2\phi_3 = r_2 - b_2\rho_1
 \end{array}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 6 / 20

Now if we subtract this, we can cancel this part. So only thing that will be left is d_2 , b_2 into ξ_1 , a_2 , r_2 and $b_2 \rho_1$.

(Refer Slide Time 10:35)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{array}{r|l}
 \text{Row 2} & b_2\phi_1 + d_2\phi_2 + a_2\phi_3 = r_2 \\
 b_2 \times \text{Row 1} & b_2\phi_1 + b_2\xi_1\phi_2 = b_2\rho_1 \\
 \hline
 \text{Updated Row 2} & (d_2 - b_2\xi_1)\phi_2 + a_2\phi_3 = r_2 - b_2\rho_1
 \end{array}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 6 / 20

Now in this case if we divide it by $d_2 - b_2 \xi_1$ and right hand side also with the same quantity, we can get the transformed form of our row 2. Our objective in this is that to convert the diagonal term with the value of 1 as coefficient. And we are storing this thing.

(Refer Slide Time 11:31)

Forward Elimination

Row 2	$b_2\phi_1 +$	$d_2\phi_2 + a_2\phi_3 = r_2$
$b_2 \times$ Row 1	$b_2\phi_1 +$	$b_2\xi_1\phi_2 = b_2\rho_1$
Updated Row 2		$(d_2 - b_2\xi_1)\phi_2 + a_2\phi_3 = r_2 - b_2\rho_1$

Division by $(d_2 - b_2\xi_1)$ yields

$$\phi_2 + \left(\frac{a_2}{d_2 - b_2\xi_1} \right) \phi_3 = \frac{r_2 - b_2\rho_1}{d_2 - b_2\xi_1}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 6 / 20

Please remember that whenever we are dividing any quantity, that $d_2 - b_2 \xi_1$, this should not be too small. Otherwise this may create numerical error if it is too close to zero value. So it will introduce error within the system.

(Refer Slide Time 11:57)

Forward Elimination

Row 2	$b_2\phi_1 +$	$d_2\phi_2 + a_2\phi_3 = r_2$
$b_2 \times$ Row 1	$b_2\phi_1 +$	$b_2\xi_1\phi_2 = b_2\rho_1$
Updated Row 2		$(d_2 - b_2\xi_1)\phi_2 + a_2\phi_3 = r_2 - b_2\rho_1$

Division by $(d_2 - b_2\xi_1)$ yields

$$\phi_2 + \frac{a_2}{d_2 - b_2\xi_1} \phi_3 = \frac{r_2 - b_2\rho_1}{d_2 - b_2\xi_1}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 6 / 20

Rewriting, if we write it in terms of ξ_2 and ρ_2 , we can write the same thing but in other form. But during implementation we are not going to utilize this ξ or ρ , because our objective is to reduce the storage structure. So we will utilize our A vector for storage of ξ_2 directly, this quantity.

(Refer Slide Time 12:46)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{array}{l|l} \text{Row 2} & b_2\phi_1 + d_2\phi_2 + a_2\phi_3 = r_2 \\ b_2 \times \text{Row 1} & b_2\phi_1 + b_2\xi_1\phi_2 = b_2\rho_1 \\ \hline \text{Updated Row 2} & (d_2 - b_2\xi_1)\phi_2 + a_2\phi_3 = r_2 - b_2\rho_1 \end{array}$$

Division by $(d_2 - b_2\xi_1)$ yields

$$\phi_2 + \frac{a_2}{d_2 - b_2\xi_1}\phi_3 = \frac{r_2 - b_2\rho_1}{d_2 - b_2\xi_1}$$

Rewriting yields

with

$$\xi_2 = \frac{a_2}{d_2 - b_2\xi_1} \quad \rho_2 = \frac{r_2 - b_2\rho_1}{d_2 - b_2\xi_1}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 6 / 20

And for r vector we can store this rho2 directly. So similarly if we reduce our row 3, we can repeat the same thing here and we can reduce our row 3. Obviously you can see that unchanged coefficients are represented with blue color and change coefficients or changed vectors are represented with red color here. So up to row 3 we have converted.

(Refer Slide Time 13:35)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

$$\begin{pmatrix} 1 & \xi_1 & 0 & 0 & 0 \\ 0 & 1 & \xi_2 & 0 & 0 \\ 0 & 0 & 1 & \xi_3 & 0 \\ 0 & 0 & b_4 & d_4 & a_4 \\ 0 & 0 & 0 & b_5 & d_5 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} \rho_1 \\ \rho_2 \\ \rho_3 \\ r_4 \\ r_5 \end{pmatrix}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 9 / 20

Now row 4 and row 5, same process will convert this total thing into upper matrix. I will not say this is upper triangular because we are getting only diagonal term and upper or above diagonal term. So now we can utilize this form for our backward substitution. Because at the last row it is clear that the coefficient is 1. It is multiplied with phi5 only, other coefficients are zero. So obviously this phi5 equals to row 5.

(Refer Slide Time 14:37)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Forward Elimination

Division by $(d_5 - b_5\xi_4)$ yields

$$\phi_5 = \frac{r_5 - b_5\rho_4}{d_5 - b_5\xi_4}$$

Rewriting yields

$$\phi_5 = \rho_5$$

with

$$\rho_5 = \frac{r_5 - b_5\rho_4}{d_5 - b_5\xi_4}$$

$$\begin{pmatrix} 1 & \xi_1 & 0 & 0 & 0 \\ 0 & 1 & \xi_2 & 0 & 0 \\ 0 & 0 & 1 & \xi_3 & 0 \\ 0 & 0 & 0 & 1 & \xi_4 \\ 0 & 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} \rho_1 \\ \rho_2 \\ \rho_3 \\ \rho_4 \\ \rho_5 \end{pmatrix}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 12 / 20

Now in this process we are starting from last row. So from last row if we start, after first calculation we have got the value of phi5. So I have changed the color of phi5.

(Refer Slide Time 15:04)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Backward Substitution

Row 5 (Last Row)

$$\phi_5 = \rho_5$$

$$\begin{pmatrix} 1 & \xi_1 & 0 & 0 & 0 \\ 0 & 1 & \xi_2 & 0 & 0 \\ 0 & 0 & 1 & \xi_3 & 0 \\ 0 & 0 & 0 & 1 & \xi_4 \\ 0 & 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} \rho_1 \\ \rho_2 \\ \rho_3 \\ \rho_4 \\ \rho_5 \end{pmatrix}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 13 / 20

Now in the next step row 4, we will get the value of phi4. So step wise we are getting different values.

(Refer Slide Time 15:17)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Backward Substitution

Row 4

$$\phi_4 + \xi_4 \phi_5 = \rho_4$$

Rewriting yields

$$\phi_4 = \rho_4 - \xi_4 \phi_5$$

$$\begin{pmatrix} 1 & \xi_1 & 0 & 0 & 0 \\ 0 & 1 & \xi_2 & 0 & 0 \\ 0 & 0 & 1 & \xi_3 & 0 \\ 0 & 0 & 0 & 1 & \xi_4 \\ 0 & 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} \rho_1 \\ \rho_2 \\ \rho_3 \\ \rho_4 \\ \rho_5 \end{pmatrix}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 14 / 20

Now in this case there is no change in a and r vector. So although this A matrix is not a complete matrix, we have reduced it into diagonal and off diagonal level column vectors. We can utilize it directly for calculation.

(Refer Slide Time 15:52)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Backward Substitution

Row 3

$$\phi_3 + \xi_3 \phi_4 = \rho_3$$

Rewriting yields

$$\phi_3 = \rho_3 - \xi_3 \phi_4$$

$$\begin{pmatrix} 1 & \xi_1 & 0 & 0 & 0 \\ 0 & 1 & \xi_2 & 0 & 0 \\ 0 & 0 & 1 & \xi_3 & 0 \\ 0 & 0 & 0 & 1 & \xi_4 \\ 0 & 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} \rho_1 \\ \rho_2 \\ \rho_3 \\ \rho_4 \\ \rho_5 \end{pmatrix}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 15 / 20

So if we start with row and finally we will get this phi1, phi2, phi3, phi4 and phi5 values.

(Refer Slide Time 16:06)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Backward Substitution

Row 1

$$\phi_1 + \xi_1 \phi_2 = \rho_1$$

Rewriting yields

$$\phi_1 = \rho_1 - \xi_1 \phi_2$$

$$\begin{pmatrix} 1 & \xi_1 & 0 & 0 & 0 \\ 0 & 1 & \xi_2 & 0 & 0 \\ 0 & 0 & 1 & \xi_3 & 0 \\ 0 & 0 & 0 & 1 & \xi_4 \\ 0 & 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} \rho_1 \\ \rho_2 \\ \rho_3 \\ \rho_4 \\ \rho_5 \end{pmatrix}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 17 / 20

Now we need to implement this in algorithm format. So first what is input that is required? We need that below diagonal, this is diagonal and above diagonal vectors. And r is another right hand side vector. Now the size of these vectors, this is N or 3N.3N for b, d, a and r is as usual we are utilizing this N for phi and N for r. These are column vectors, N cross 1, N cross 1. So 3N cross 1 that is required storage structure. So instead of N into 1 N into N into our N. That means if we have N equals to 5 we need to store 25 elements of our A matrix. But instead of that we are storing only below diagonal, diagonal and above diagonal values or coefficient values in a column vector format. So these are inputs.

(Refer Slide Time 17:46)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Thomas Algorithm

Data: Vector b, d, a, r

Result: ϕ

Forward Elimination

$$a_1 = a_1/d_1$$

$$r_1 = r_1/d_1$$

for $i = 2, n - 1$ do

$$fact = d_i - b_i \cdot a_{i-1}$$

$$a_i = a_i/fact$$

$$r_i = (r_i - b_i \cdot r_{i-1})/fact$$

end

$$r_n = (r_n - b_n \cdot r_{n-1})/(d_n - b_n \cdot a_{n-1})$$

Backward Substitution

$$\phi_n = r_n$$

for $i = n - 1, -1, 1$ do

$$\phi_i = r_i - a_i \cdot \phi_{i+1}$$

end

return ϕ

Handwritten notes: $3N \times 1$, $N \times N$, $N=5$, 25 , A , $N \times N \times 1$, ϕ , T

Dr. Anirban Dhar NPTEL Computational Hydraulics 18 / 20

Now output or result is ϕ . So first is forward elimination. As I have told earlier that we are not utilizing x_i and r_i as our separate vectors. Because that will require more storage. So we are using a_i and r_i only. So a_i equals to a_i divided by d_i , r_i equals to r_i divided by d_i . This means that in the first step when we have converted this into x_{i1} and this into r_{i1} . Actually this is not a required.

We can store the same value in a_i , because value is further not required for our calculation. In case of Gauss elimination we have seen that we need undisturbed first level for our calculation process. Here it is not required.

(Refer Slide Time 19:24)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Thomas Algorithm

Data: Vector b, d, a, r
Result: ϕ

Forward Elimination
 $a_1 = a_1/d_1$
 $r_1 = r_1/d_1$
for $i = 2, n - 1$ **do**
 $fact = d_i - b_i \cdot a_{i-1}$
 $a_i = a_i/fact$
 $r_i = (r_i - b_i \cdot r_{i-1})/fact$
end
 $r_n = (r_n - b_n \cdot r_{n-1})/(d_n - b_n \cdot a_{n-1})$

Backward Substitution
 $\phi_n = r_n$
for $i = n - 1, -1, 1$ **do**
 $\phi_i = r_i - a_i \cdot \phi_{i+1}$
end
return ϕ

$z_1 = a_1 = \frac{a_1}{d_1}$ $p_1 r_1 = \frac{r_1}{d_1}$

Dr. Anirban Dhar NPTEL Computational Hydraulics 18 / 20

Now we are starting from 2 to n minus 1. Why n minus 1? Because for n th row we will have only our r term. Because diagonal term will be 1, so r term. And this is ϕ_n . So ϕ_n equals to r_n . So in this process we are calculating up to our a_i equals to a_i divided by factor. It is for 2 to n minus 1. So only for interior values.

(Refer Slide Time 20:27)

Forward Elimination
Backward Substitution
Algorithm Example
I.I.T. Kharagpur

Thomas Algorithm

Data: Vector b, d, a, r
Result: ϕ

Forward Elimination
 $a_1 = a_1/d_1$
 $r_1 = r_1/d_1$
 for $i = 2, n-1$ do
 $fact = d_i - b_i \cdot a_{i-1}$
 $a_i = a_i/fact$
 $r_i = (r_i - b_i \cdot r_{i-1})/fact$
 end

Backward Substitution
 $\phi_n = r_n$
 for $i = n-1, -1, 1$ do
 $\phi_i = r_i - a_i \cdot \phi_{i+1}$
 end
 return ϕ

Dr. Anirban Dhar NPTEL Computational Hydraulics 18 / 20

And at the end points we are explicitly calculating r_n . We are avoiding the calculation of a_n because a_n is already zero value. We already know because we have this kind of structure. So lower value is zero. For b_1 , this is not required. That is why at the first place we have calculated a_1 . We already know that converted d_1 will be our 1. So we don't need to write that value here.

(Refer Slide Time 21:06)

Forward Elimination
Backward Substitution
Algorithm Example
I.I.T. Kharagpur

Thomas Algorithm

Data: Vector b, d, a, r
Result: ϕ

Forward Elimination
 $a_1 = a_1/d_1$
 $r_1 = r_1/d_1$
 for $i = 2, n-1$ do
 $fact = d_i - b_i \cdot a_{i-1}$
 $a_i = a_i/fact$
 $r_i = (r_i - b_i \cdot r_{i-1})/fact$
 end

Backward Substitution
 $\phi_n = r_n$
 for $i = n-1, -1, 1$ do
 $\phi_i = r_i - a_i \cdot \phi_{i+1}$
 end
 return ϕ

Dr. Anirban Dhar NPTEL Computational Hydraulics 18 / 20

And backward substitution process, we can directly write it as ϕ equals to r_n . Because coefficient is 1. So directly r_n we can write. Because within r_n only we are storing the values. Now in this case one thing is clear. In Gauss elimination we have two step process. We are

fixing a particular row and then operating on other rows. In this case we are utilizing the information of the previous row and we are operating on the next row.

(Refer Slide Time 22:03)

Forward Elimination
Backward Substitution
Algorithm Example
I.I.T. Kharagpur

Thomas Algorithm

Data: Vector b, d, a, r
Result: ϕ

Forward Elimination
 $a_1 = a_1/d_1$
 $r_1 = r_1/d_1$
for $i = 2, n - 1$ **do**
 $fact = d_i - b_i \cdot a_{i-1}$
 $a_i = a_i/fact$
 $r_i = (r_i - b_i \cdot r_{i-1})/fact$
end
 $r_n = (r_n - b_n \cdot r_{n-1})/(d_n - b_n \cdot a_{n-1})$

Backward Substitution
 $\phi_n = r_n$
for $i = n - 1, -1, 1$ **do**
 $\phi_i = r_i - a_i \cdot \phi_{i+1}$
end
return ϕ

Dr. Anirban Dhar NPTEL Computational Hydraulics 18 / 20

So only one loop is required. No two loops for this one. Similarly for backward substitution this is clear because coefficient of phi, this is 1. So r_1 minus a_1 . So a_1 is storing the x_{i-1} values. So this will give the actual value for this one.

(Refer Slide Time 22:42)

Forward Elimination
Backward Substitution
Algorithm Example
I.I.T. Kharagpur

Thomas Algorithm

Data: Vector b, d, a, r
Result: ϕ

Forward Elimination
 $a_1 = a_1/d_1$
 $r_1 = r_1/d_1$
for $i = 2, n - 1$ **do**
 $fact = d_i - b_i \cdot a_{i-1}$
 $a_i = a_i/fact$
 $r_i = (r_i - b_i \cdot r_{i-1})/fact$
end
 $r_n = (r_n - b_n \cdot r_{n-1})/(d_n - b_n \cdot a_{n-1})$

Backward Substitution
 $\phi_n = r_n$
for $i = n - 1, -1, 1$ **do**
 $\phi_i = r_i - a_i \cdot \phi_{i+1}$
end
return ϕ

Dr. Anirban Dhar NPTEL Computational Hydraulics 18 / 20

Because we need only ϕ_{i+1} value. Because we have only upper diagonal available. Lower diagonal, we have eliminated that and we have calculated it as zero value. So we don't need to utilize it within our calculation process.

(Refer Slide Time 23:08)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Thomas Algorithm

Data: Vector b, d, a, r
Result: ϕ

Forward Elimination
 $a_1 = a_1/d_1$
 $r_1 = r_1/d_1$
 for $i = 2, n - 1$ do
 $fact = d_i - b_i \cdot a_{i-1}$
 $a_i = a_i/fact$
 $r_i = (r_i - b_i \cdot r_{i-1})/fact$
 end
 $r_n = (r_n - b_n \cdot r_{n-1})/(d_n - b_n \cdot a_{n-1})$

Backward Substitution
 $\phi_n = r_n$
 for $i = n - 1, -1, 1$ do
 $\phi_i = r_i - a_i \cdot \phi_{i+1}$
 end
 return ϕ

Dr. Anirban Dhar NPTEL Computational Hydraulics 18 / 20

Now in this case we can again utilize our standard example. Because this is having diagonal structure. So in this case we can utilize the concept. This is not available, this first one is not available.

(Refer Slide Time 23:37)

Forward Elimination
Backward Substitution
Algorithm
Example

I.I.T. Kharagpur

Example

$$\begin{pmatrix} 1 & 0 & 0 & 0 & 0 \\ 1 & 2 & 1 & 0 & 0 \\ 0 & 1 & 3 & -1 & 0 \\ 0 & 0 & 1 & 2 & 1 \\ 0 & 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} 1 \\ 12 \\ 11 \\ 28 \\ 9 \end{pmatrix}$$

Solution:

$$\begin{pmatrix} \phi_1 \\ \phi_2 \\ \phi_3 \\ \phi_4 \\ \phi_5 \end{pmatrix} = \begin{pmatrix} 1 \\ 3 \\ 5 \\ 7 \\ 9 \end{pmatrix}$$

Dr. Anirban Dhar NPTEL Computational Hydraulics 19 / 20

Now we already know what is the solution for this problem? We have utilized Gauss elimination and our LU decomposition for solution of this problem. Now in this case we can use this tridiagonal matrix thing. This is compatible a smaller code. It is not a lengthy one. Clc, clear, these are basic lines that are required to clear the console and clear the memory in console. Then function required is phi. We need to supply b, d, a and r. This is tdmassolv.

Now n is the number of rows. Nequals to length of d . D is the diagonal that we are transferring. Now directly we are writing a_1 equals to a_1 divided by d_1 , r_1 equals to r_1 divided by d_1 . And in the forward elimination processwe are calculating this factor, i equals to 2 to n minus 1. Because we don't need to calculate the a . Because the n th value of a is not available. So $fact$ equals to d_i minus b into a_i minus 1. So it is the previous value.

And with this factor we are just multiplying these to get a and r values, updated one. Because diagonal will be automatically converted into 1, unity.

(Refer Slide Time 25:40)

```

1 clear
2 clc
3 function phi = ldmansoly(b,d,a,r)
4 // n: number of rows
5 n = length(d);
6 a(1) = a(1) / d(1);
7 r(1) = r(1) / d(1);
8 // Forward Elimination
9 for i = 2:n-1
10     fact = d(i) - b(i) * a(i-1);
11     a(i) = a(i) / fact;
12     r(i) = (r(i) - b(i) * r(i-1))/fact;
13 end
14
15 r(n) = (r(n) - b(n) * r(n-1))/( d(n) - b(n) * a(n-1));
16
17 // Backward Substitution
18 phi(n) = r(n);
19 for i = n-1:-1:1
20     phi(i) = r(i) - a(i) * phi(i + 1);
21 end
22 endfunction
23
24 d=[1 2 3 2 1];
25 b=[0 1 1 1 0];
26 a=[0 1 -1 1 0];
27 r=[1 12 11 28 9];
28
29 phi = ldmansoly(b,d,a,r)
30
31
32

```

In this case r_n equals to r_n minus b_n . We are directly calculating this. Now in backward substitution process ϕ_n equals to r_n . Now ϕ_n equals to r_n that is similar to our Gauss elimination.

(Refer Slide Time 26:04)

```
1 clear
2 clear
3 function phi = tdmassoly(b,d,a,r)
4 // n: number of rows
5 n = length(d);
6 a(1) = a(1) / d(1);
7 r(1) = r(1) / d(1);
8 // Forward Elimination
9 for i = 2:n-1
10     fact = d(i) - b(i) * a(i-1);
11     a(i) = a(i) / fact;
12     r(i) = (r(i) - b(i) * r(i-1))/fact;
13 end
14
15 r(n) = (r(n) - b(n) * r(n-1))/( d(n) - b(n) * a(n-1));
16
17 // Backward Substitution
18 phi(n) = r(n);
19 for i = n-1:-1:1
20     phi(i) = r(i) - a(i) * phi(i + 1);
21 end
22 endfunction
23
24
25
26 d=[1 2 3 2 1];
27 b=[0 1 1 1 0];
28 a=[0 1 -1 1 0];
29 r=[1 12 11 28 9];
30
31 phi = tdmassoly(b,d,a,r)
32
```

But in Gauss elimination you need information about all previous variables. But in this case only the immediate previous variable that is for phi, phi i plus 1 is required. Because we are moving in the backward direction. This is forward elimination, backward direction. We are starting from N.

(Refer Slide Time 26:34)

```
1 clear
2 clear
3 function phi = tdmassoly(b,d,a,r)
4 // n: number of rows
5 n = length(d);
6 a(1) = a(1) / d(1);
7 r(1) = r(1) / d(1);
8 // Forward Elimination
9 for i = 2:n-1
10     fact = d(i) - b(i) * a(i-1);
11     a(i) = a(i) / fact;
12     r(i) = (r(i) - b(i) * r(i-1))/fact;
13 end
14
15 r(n) = (r(n) - b(n) * r(n-1))/( d(n) - b(n) * a(n-1));
16
17 // Backward Substitution
18 phi(n) = r(n);
19 for i = n-1:-1:1
20     phi(i) = r(i) - a(i) * phi(i + 1);
21 end
22 endfunction
23
24
25
26 d=[1 2 3 2 1];
27 b=[0 1 1 1 0];
28 a=[0 1 -1 1 0];
29 r=[1 12 11 28 9];
30
31 phi = tdmassoly(b,d,a,r)
32
```

So we already have N value here. Now for N we are starting calculation of N minus 1. To calculate N minus 1 we need value of N. So to calculate 1 we need value of 2, like that. So finally we can get the solution.

(Refer Slide Time 28:10)

```

1 clear
2 clear
3 function phi = tdmasolv(b,d,a,r)
4 // n: number of rows
5 n = length(d);
6 a(1) = a(1) / d(1);
7 r(1) = r(1) / d(1);
8 // Forward Elimination
9 for i = 2:n-1
10     fact = d(i) - b(i) * a(i-1);
11     a(i) = a(i) / fact;
12     r(i) = (r(i) - b(i) * r(i-1))/fact;
13 end
14
15 r(n) = (r(n) - b(n) * r(n-1))/( d(n) - b(n) * a(n-1));
16
17 // Backward Substitution
18 phi(n) = r(n);
19 for i = n-1:-1:1
20     phi(i) = r(i) - a(i) * phi(i + 1);
21 end
22 endfunction
23
24
25
26 d=[1 2 3 2 1];
27 b=[0 1 1 1 0];
28 a=[0 1 -1 1 0];
29 r=[1 12 11 28 9];
30
31 phi = tdmasolv(b,d,a,r);
32

```

Handwritten annotations in red:

- A downward arrow pointing to the code.
- A matrix $A = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 1 & 2 & 1 & 0 \\ 1 & 3 & -1 & 1 \\ 1 & 2 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{bmatrix}$
- A list of values: 1, 2, 2, 2.

So this is 1 this is 112321. So this is 12321. So next is below diagonal. This is b is 01110. So this is 01110. Then above diagonal this is starting from 01 -11 and last one is 0. And r which is on the right hand side this is 1, 12, 11, 28 and 9. Now we can call this tdmasolv to get the solution.

(Refer Slide Time 29:07)

```

1 clear
2 clear
3 function phi = tdmasolv(b,d,a,r)
4 // n: number of rows
5 n = length(d);
6 a(1) = a(1) / d(1);
7 r(1) = r(1) / d(1);
8 // Forward Elimination
9 for i = 2:n-1
10     fact = d(i) - b(i) * a(i-1);
11     a(i) = a(i) / fact;
12     r(i) = (r(i) - b(i) * r(i-1))/fact;
13 end
14
15 r(n) = (r(n) - b(n) * r(n-1))/( d(n) - b(n) * a(n-1));
16
17 // Backward Substitution
18 phi(n) = r(n);
19 for i = n-1:-1:1
20     phi(i) = r(i) - a(i) * phi(i + 1);
21 end
22 endfunction
23
24
25
26 d=[1 2 3 2 1];
27 b=[0 1 1 1 0];
28 a=[0 1 -1 1 0];
29 r=[1 12 11 28 9];
30
31 phi = tdmasolv(b,d,a,r);
32

```

Handwritten annotations in red and green:

- A downward arrow pointing to the code.
- A matrix $A = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 1 & 2 & 1 & 0 \\ 1 & 3 & -1 & 1 \\ 1 & 2 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{bmatrix}$
- A list of values: 1, 2, 2, 2.
- Green highlights on lines 26-31 of the code.

So let us see what solution it is giving. Now we can select it and evaluate selection.

(Refer Slide Time 29:20)

```

1 clear
2
3 function phi = tdmassolv(b,d,a,r)
4
5 // n: number of rows
6 n = length(d);
7
8 x(1) = a(1) / d(1);
9 x(1) = x(1) /
10 // Forward El
11 for i = 2:n-1
12     fact = d(i)
13     a(i) = a(i)
14     x(i) = (x
15     x(n) = (x(n)
16 // Backward S
17 phi(n) = x(n)
18 for i = n-1:-1:
19     phi(i) =
20
21 end
22 endfunction

```

Even for penta-diagonal structures, if we have penta-diagonal matrix structure then penta-diagonal matrix structure like this that we have seen in our one of the two dimensional problems. That if you have zero values in between and you have 5 diagonals. not diagonals, one diagonal and two off diagonals on each side available then we can frame our algorithm in

such a way that it not need maximum storage required that is N cross N. We can reduce our storage structure by introducing different algorithms.
