Lecture – 10
Tutorial on Lookback

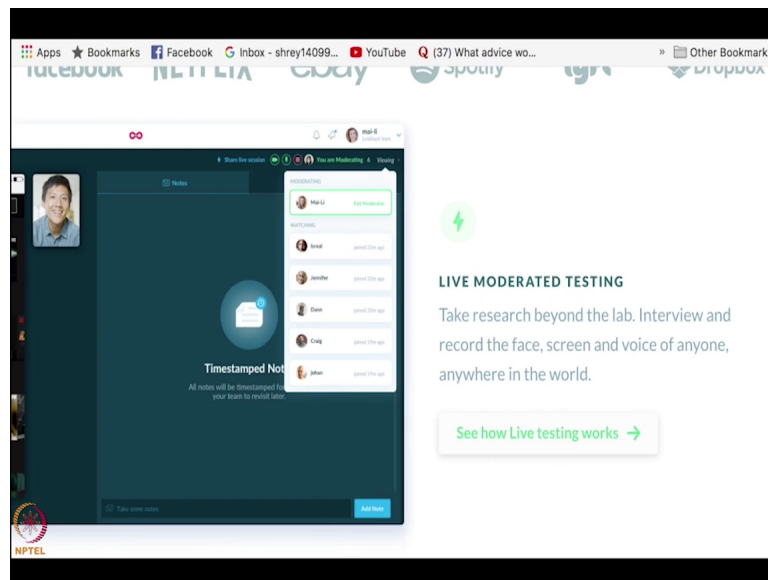

(Refer Slide Time: 00:18)

Hi everyone, today we will be looking at look back dot io which is a simple yet powerful tool for conducting user research. The tool reduces the inconvenience associated with being physically present for conducting user research. It allows us to conduct these stars remotely over the internet. It lets us capture audio, video as well as the screen of the user which makes it a suitable replacement for in person interviews. Further the captured audio and videos can be also be saved, this allows us to watch the unordered videos at a later time which is useful for making minute inferences.

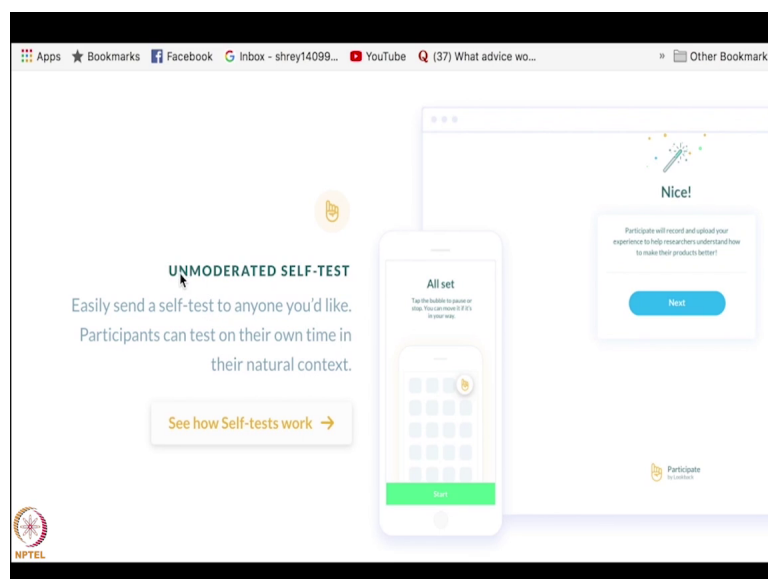

Another useful feature of look back dot io is that it supports multiple platforms. We can use the tool for testing both web sites as well as mobile phone applications on android as well as ios. In fact, they even let us upload apks for android applications to allow us for an organic user experience. Now, let us take a look at the website. So, here you can see the exact url on how to access the website is called lookback.io. The web site provides some basic information on how to use look back and some the some features. We will quickly look at into the important features for now.

(Refer Slide Time: 01:48)

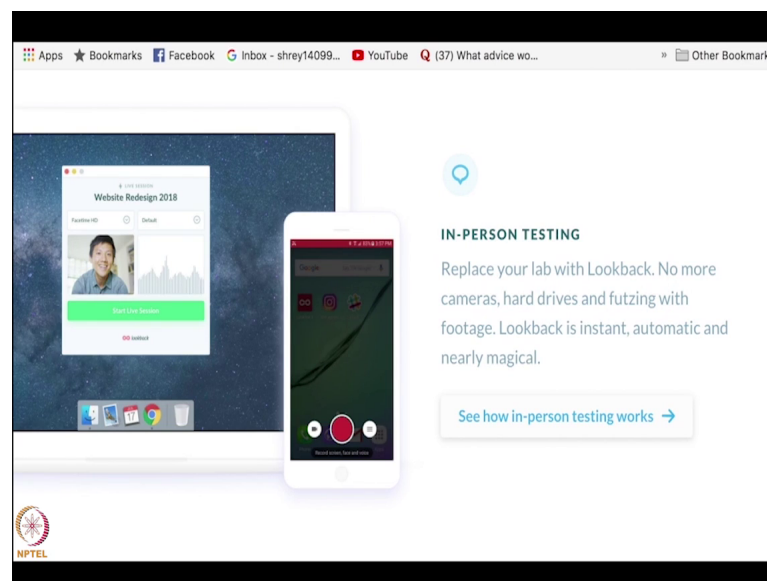

There are three kinds of user testing environments that look back dot io supports. The first one is called live motivated testing. In this form of user testing, we are connected to the user via audio or video in real time. We interact with the user as we would over a Skype call, and we give them instructions on what to do. During all this time we get to see the user screen their actions and how they interact with their applications which are very valuable observations.

(Refer Slide Time: 02:22)

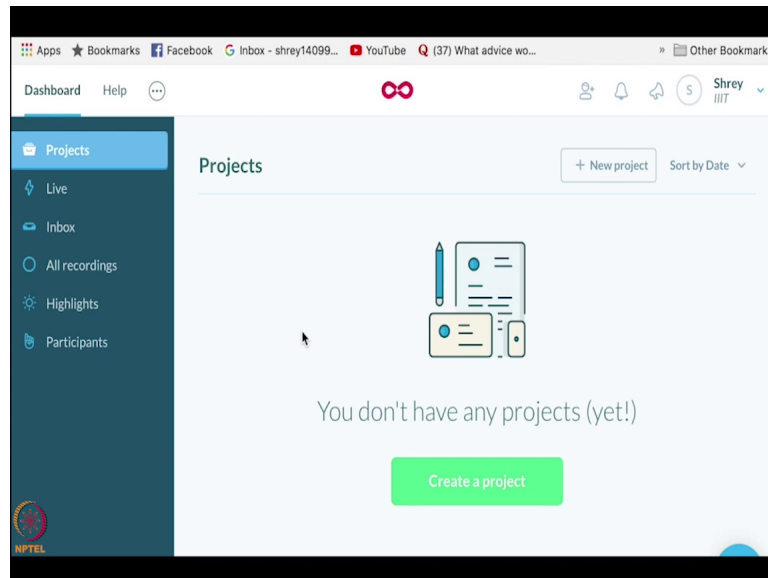

The next one is called unmoderated self-tests. Here we sent the user some context and some instructions on the task we would like them to perform their application. This is not a real time interview; the user can undertake the interview at their convenience and in any environment. The added convenience comes at the cost of the loss of flexibility in conducting the interview. What this means is that the users are stuck with only the information we provide them in the beginning, and we cannot interact with the person in real time to give them personalized feedback or instructions testing.

(Refer Slide Time: 03:06)

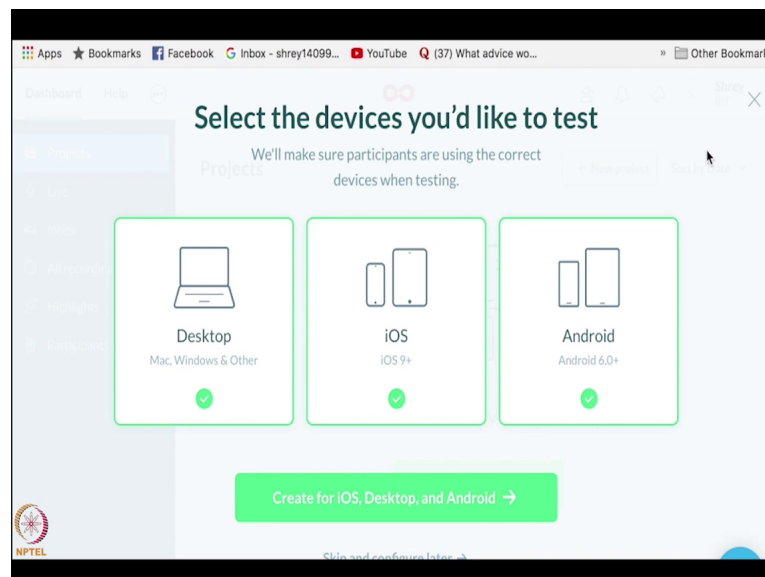

This is a simplified way of conducting interviews when the user is physically present with you. It allows us to record to it allows us to use the tool to directly record and observe saving us the effort of setting up cameras and mics. The most important of the three kinds of available interactions is the live moderated testing. We will now see how to launch live moderated testing session. First sign up for an account on look back dot io. This is a fairly simple process and the signup and creating an account is free for the first 14 days. However, it is easy to create new accounts in case you need more time.

(Refer Slide Time: 03:56)

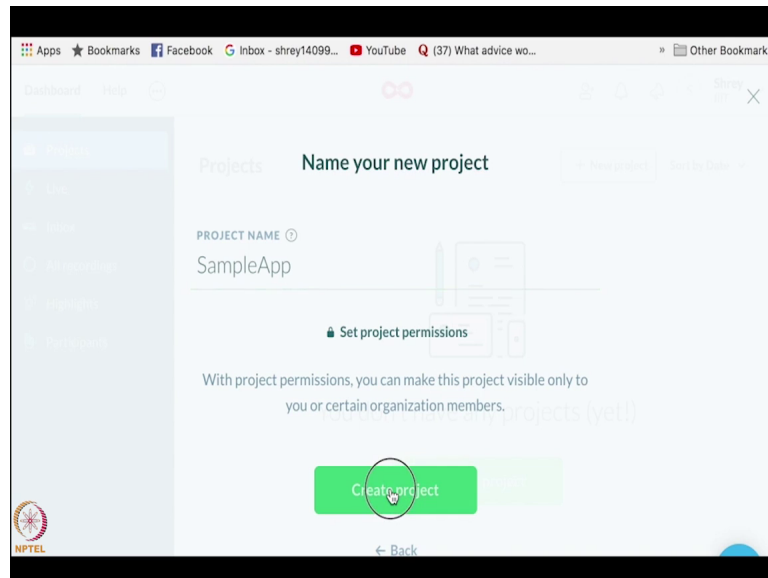

So, after you sign up and log in you presented with this screen which shows you the projects that you have already created and let us you manage them. Now, let us create an application.

(Refer Slide Time: 04:10)

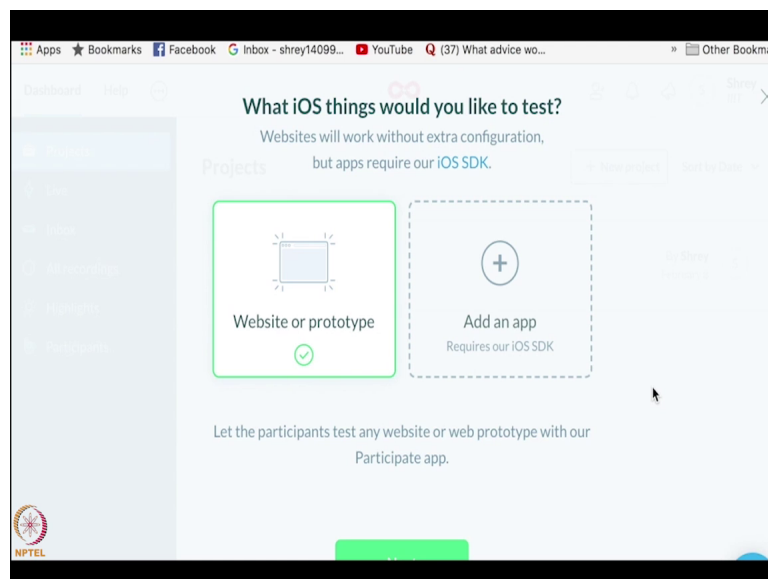

The website asks you the devices you would like to allow users to test your app on and lets you select from desktop, MAC, iOS and android. By default all three of them are selected. We will go ahead with the selection.

(Refer Slide Time: 04:26)

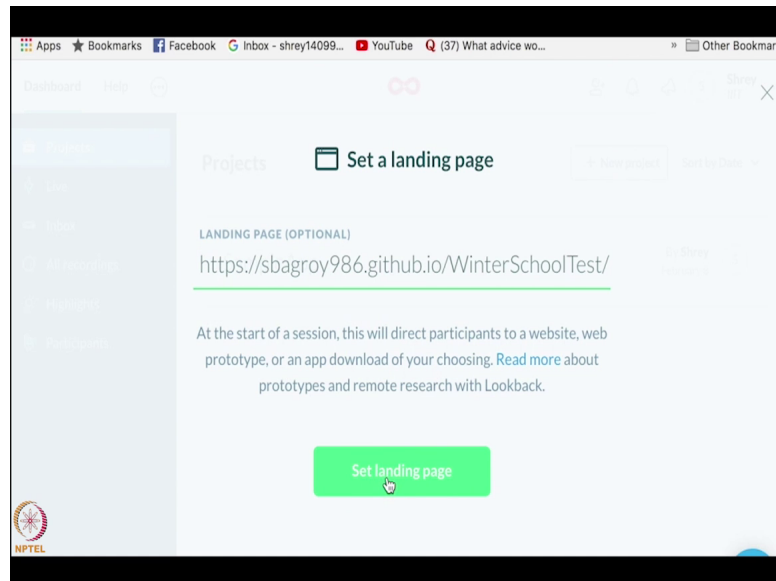

Next, we have to provide a sample name for our application users call it sample app.

(Refer Slide Time: 04:42)

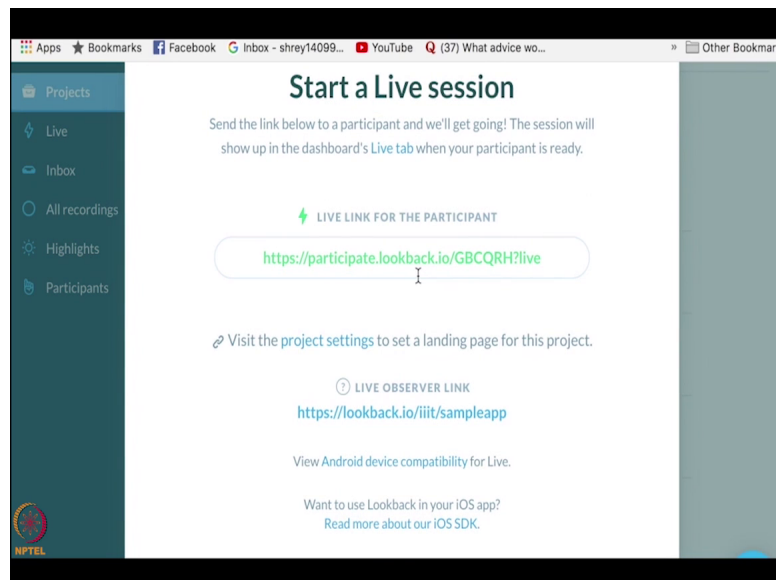

Next, the website asks whether or application is a website or a mobile phone application. If it is a mobile phone app, it also lets us upload a file containing our app for users to install on their phones. In this tutorial we will test a website, but the process remains the same even for a mobile phone application.

(Refer Slide Time: 05:05)

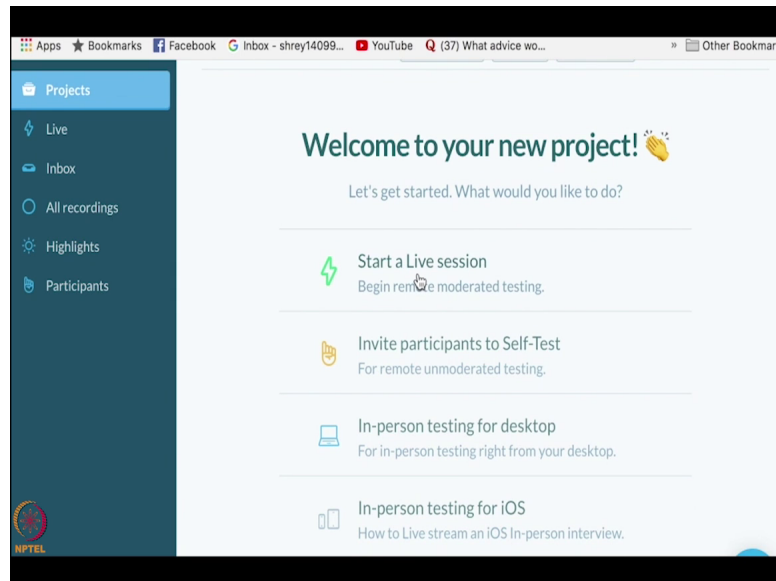

Now, we need to provide a link to the website we would like our users to test. We have a sample website here and we are just going to use this.

(Refer Slide Time: 05:17)

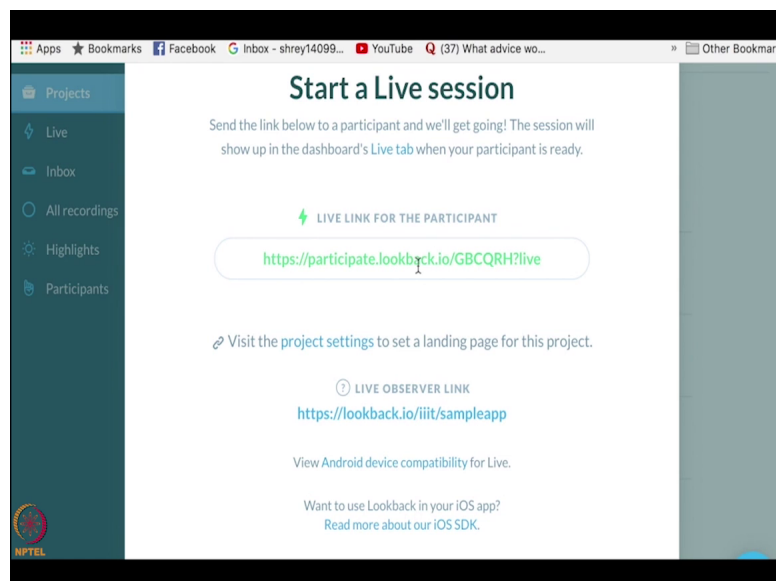

Lastly, we can add some text to be shown to users both before and after the session. This allows us to set some context for them and also can be used for a post session survey. We will skip this for now. Now, we are ready to launch a session we click on the live project and then select the live session option.

(Refer Slide Time: 05:35)

(Refer Slide Time: 15:40)

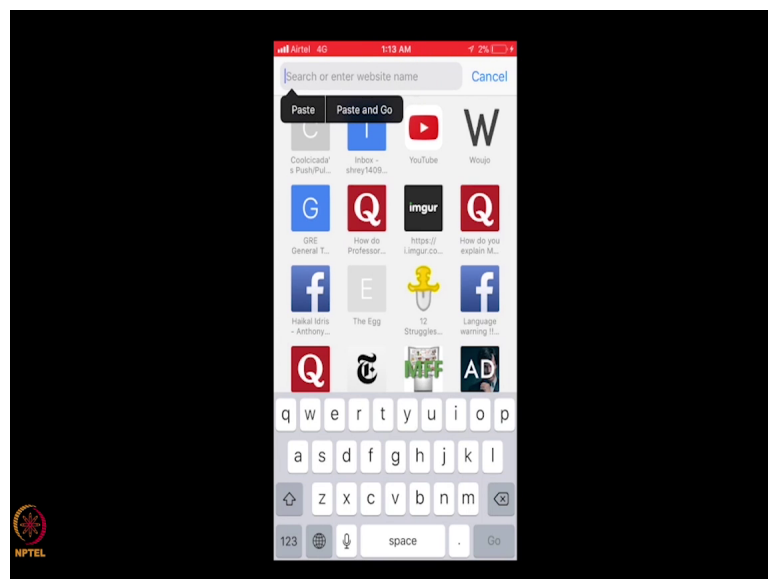

Now, we have a link which we need to share with our users.

(Refer Slide Time: 05:45)

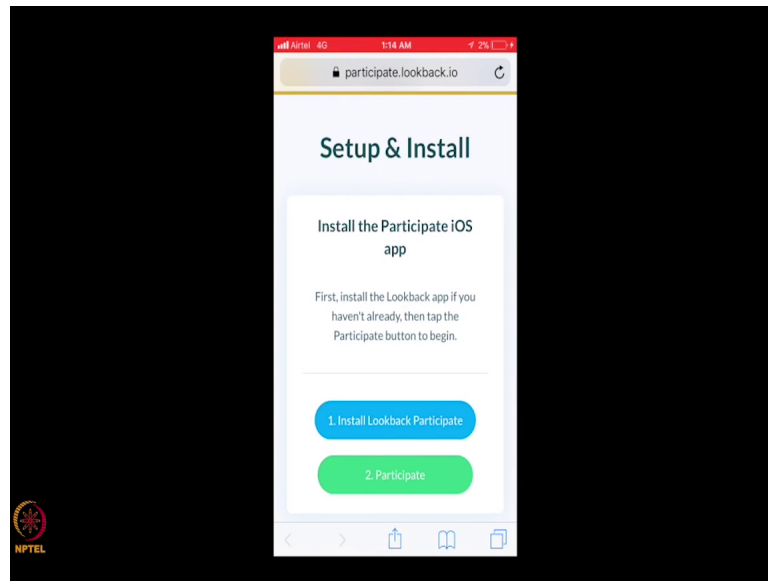

Now, we take a quick look at the users perspective.

(Refer Slide Time: 05:50)

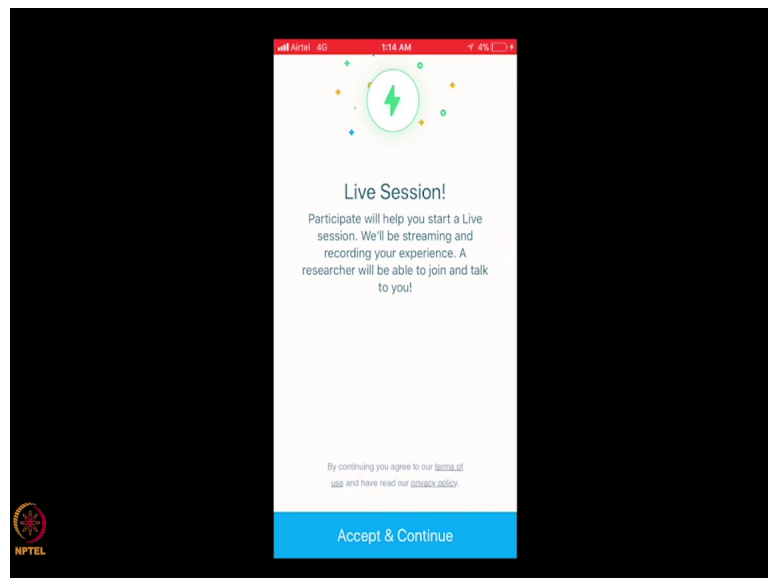

When the user opens up the link we send in this case on a phone, we see that it redirect them to a website which contains some further instructions.

(Refer Slide Time: 06:00)

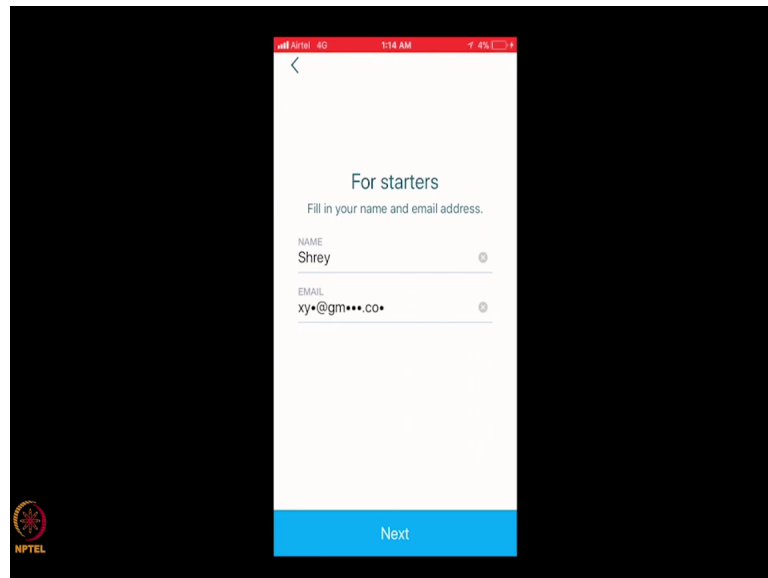

The website drums the users to install an application called loopback participate. Once installed the users simply clicks on participate and it opens up our application.

(Refer Slide Time: 06:28)

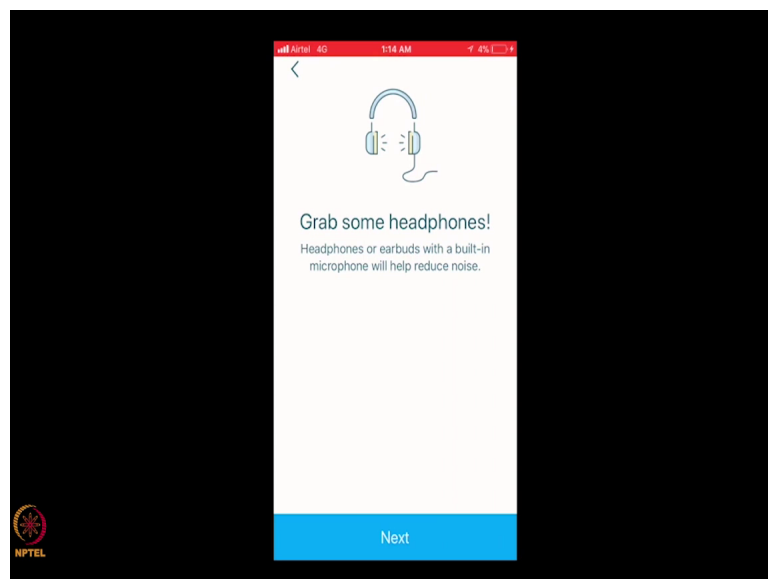

The user is then asked to give their consent heading into the session as well as provide some information.

(Refer Slide Time: 06:34)

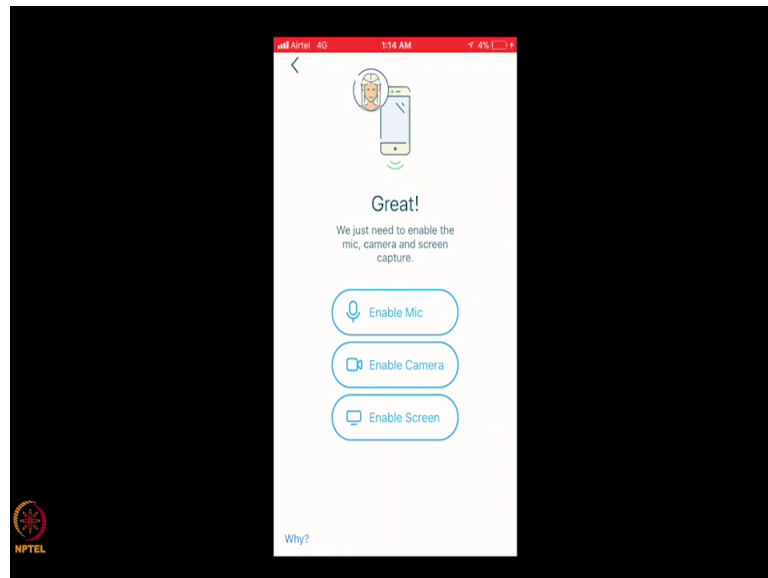

Such as their name and email.

(Refer Slide Time: 06:39)

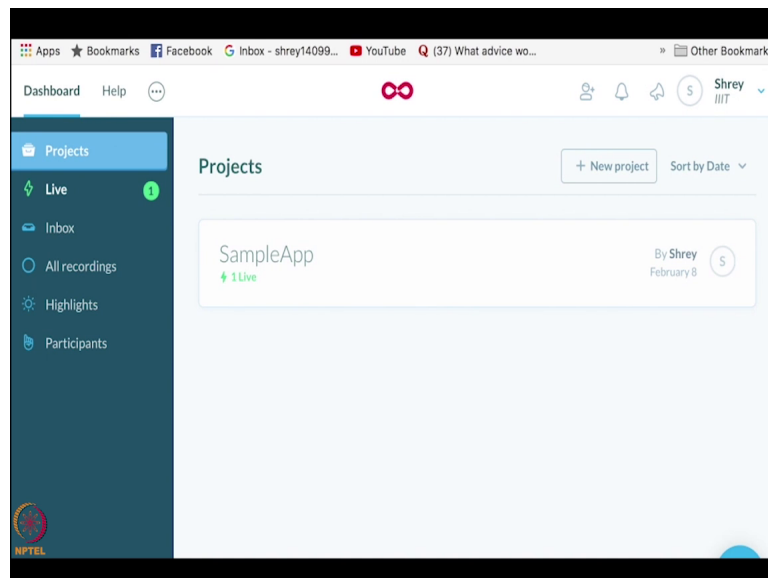

They are also given a suggestion to put on headphones for easier communication over audio.

(Refer Slide Time: 06:45)

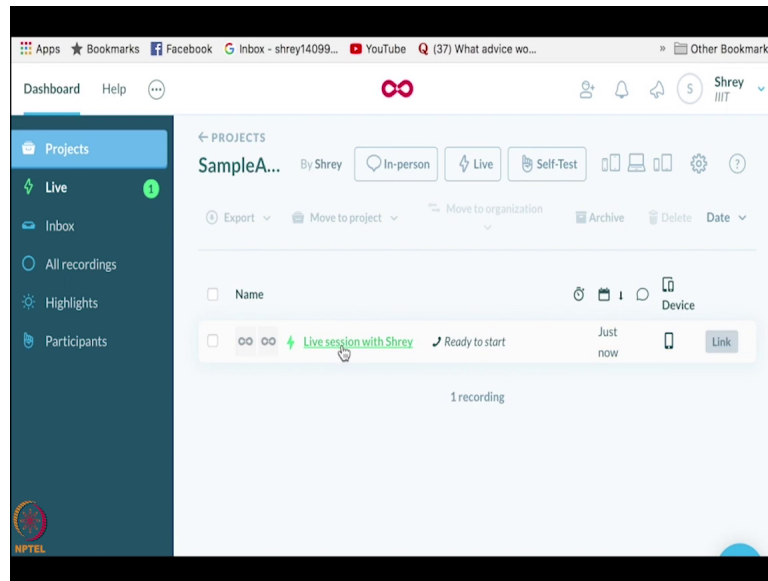

Next, the user has shown some options on the kind of data they are willing to share we will select all three.

(Refer Slide Time: 07:00)

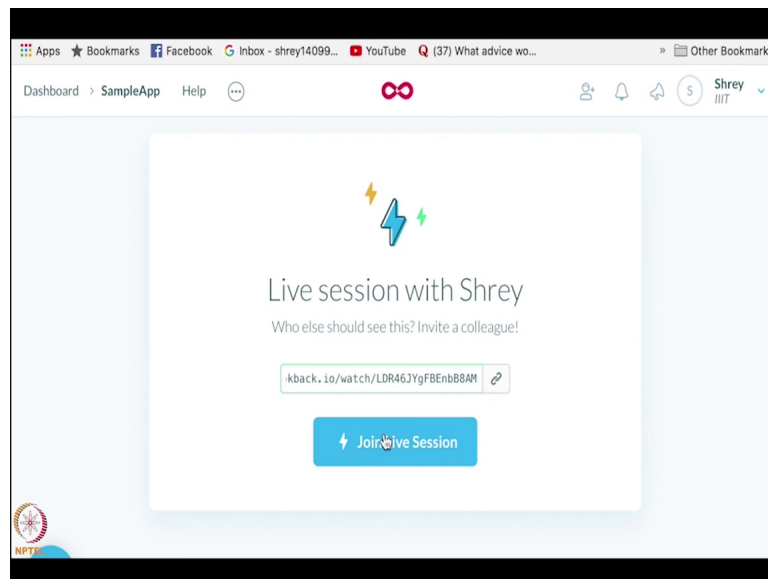

And that is it from the user side. Once they are setup is complete, we find that a session show which is ready to join shows up on our dashboard.

(Refer Slide Time: 07:09)

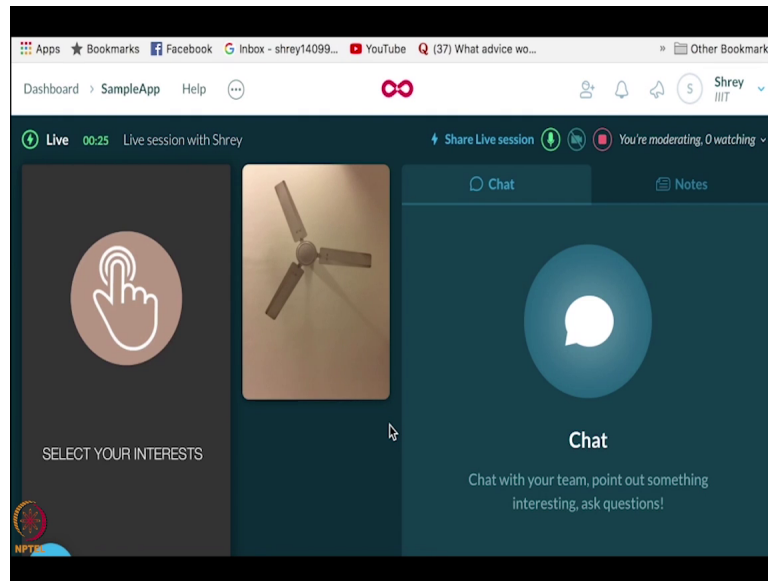

We now click here and here to join the session.

(Refer Slide Time: 07:11)

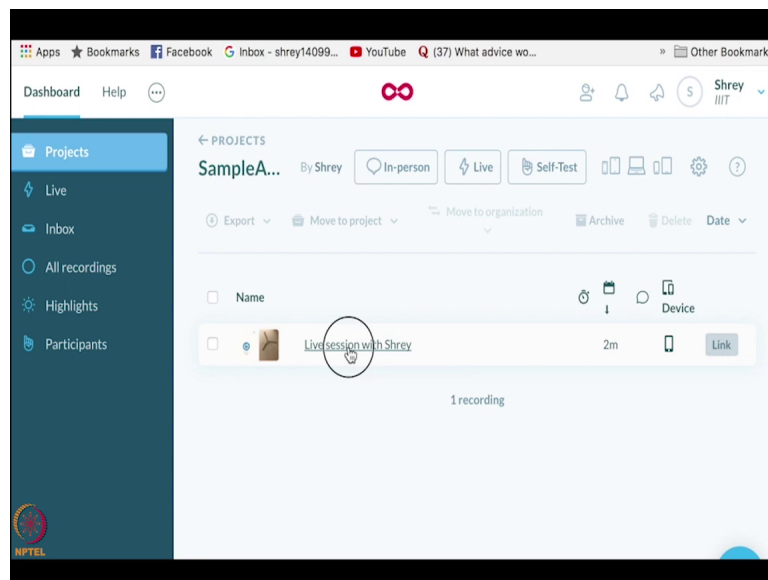

We now wait for the user to accept our session call.

(Refer Slide Time: 07:22)

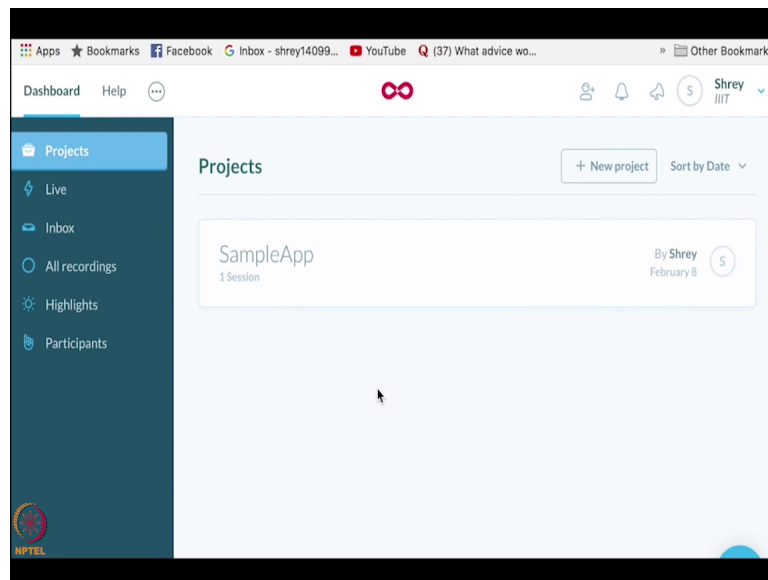

Now, once the users connect, we end up on this screen. Take a quick second to observe this interface. We can now hear the user look at their video, and also view their screen. Once done with that interaction, we can end our session to save a captured video.

(Refer Slide Time: 08:26)

We can then go back to the dashboard and click on the session, to re watch it carefully that is it for this demo on look back dot io.

(Refer Slide Time: 08:41)

Feel free to reach out to us in case you have any more questions on the tool.

Thanks so much for watching.
