Principle of Inclusion and Exclusion

Example 2 - Integer solutions of an equation

By
Prof. S.R.S Iyengar
Department of Computer Science
IIT Ropar

How many integer solutions are there to the equation $X_1 + X_2 + X_3 + X_4 = 25$, where all these exercise that is X_1, X_2, X_3, X_4 lie in the range 0 to 10,
(Refer Slide Time: 00:20)

none of them exceed 10, but they are some must be equal to 25, now how many such solutions are possible? I'm going to write C_1 as the solutions where X_1 is at least 11, and C_2 as the solutions where X_2 is at least 11, C_3 where the solutions where X_3 is at least 11, and C_4 are the solutions where X_4 is at least 11.

(Refer Slide Time: 00:47)

How many integer solutions are there to the equation $x_1 + x_2 + x_3 + x_4 = 25$ where $0 \leq x_i \leq 10$ for all $1 \leq i \leq 4$.

C_1 : Solutions where x_1 is at least 11.

C_2 : Solutions where x_2 is at least 11.

C_3 : Solutions where x_3 is at least 11.

C_4 : Solutions where x_4 is at least 11.

Now why did I write just the opposite of the given condition? Well, the reason was stated in the first video itself, sometimes when we want the particular thing we should look at what we don't want, and hence since we want to calculate $N(C_1 \text{ bar})$, $C_2 \text{ bar}$, $C_3 \text{ bar}$, $C_4 \text{ bar}$, I'm going to look at these C_i 's, $N(C_1)$ states the number of solutions where x_1 is at least 11, (Refer Slide Time: 01:19)

IIT
Ropar

$N(C_i) = \text{Number of solutions where } x_i \text{ is at least } 1.$

how many such solutions are possible let us see, before going to $N(C_1)$ or $N(C_2)$ or $N(C_3)$ or $N(C_4)$ let me tell what are the total possible solutions, the total possible solutions is if you remember the sticks and the cups problem following the same logic here, we see that N is 4 here, there are 4 exercise, and we have R as 25 here, so it is $N+R - 1$ choose R which gives $4 + 25 - 1$ choose 25 which is 28 choose 25.

(Refer Slide Time: 02:01)

$N(C_1)$ = Number of solutions where x_1 is at least 11.

Total possible solutions is :

$$\begin{aligned}n &= 4 & r &= 25 \\ \binom{n+r-1}{r} &= \binom{4+25-1}{25} \\ &= \binom{28}{25}\end{aligned}$$

Now $N(C_1)$ happens to be the number of solutions where X_1 is at least 11, I can turn down this equation as $X_1 + X_2 + X_3 + X_4 = 14$, how? I earlier stated that X_1 must be at least 11, now I'm going to just remove 11 from both the sides, what does that become? $X_1 + X_2 + X_3 + X_4 = 14$, earlier X_1 had to take the value 11, 12, 13, so on, whatever be the possibility at least 11 it had to take,

(Refer Slide Time: 02:43)

$N(c_i)$ = Number of solutions where x_1 is at least 11.

$$x_1 + x_2 + x_3 + x_4 = 14$$

$$x_1 + x_2 + x_3 + x_4 = 25 ; x_1 \geq 11, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

Removing 11 units

$$x_1 + x_2 + x_3 + x_4 = 14 ; x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

now since I have removed the possibility of 11 it takes the value from 0, right, let me enumerate some of them for you, if x_1, x_2, x_3, x_4 their sum is 14 and I say that some of the enumerations go like this, 0, 1, 9, 4 or 1, 2, 10 and 1 and so on, it is equivalent to asking $x_1 + x_2 + x_3 + x_4$ should be 25 with x_1 at least 11.
(Refer Slide Time: 03:27)

$N(C_1)$ = Number of Solutions where x_1 is at least 11.

$$x_1 + x_2 + x_3 + x_4 = 14$$

$$x_1 + x_2 + x_3 + x_4 = 25 ; x_1 \geq 11, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

Removing 11 units

$$x_1 + x_2 + x_3 + x_4 = 14 ; x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

$$0 + 1 + 9 + 4 = 14 \quad N(C_1) =$$

$$1 + 2 + 10 + 1 = 14$$

Now how many such possibilities are there? Again following combination with repetitions it is $4 + 14 - 1$ choose 14 which is 17 choose 14,
(Refer Slide Time: 03:36)

$N(C_1)$ = Number of Solutions where x_1 is at least 11.

$$x_1 + x_2 + x_3 + x_4 = 14$$

$$x_1 + x_2 + x_3 + x_4 = 25 ; x_1 \geq 11, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

Removing 11 units

$$x_1 + x_2 + x_3 + x_4 = 14 ; x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

$$0 + 1 + 9 + 4 = 14 \quad N(C_1) = \binom{4+14-1}{14} = \binom{17}{14}$$

$$1 + 2 + 10 + 1 = 14$$

$N(C_1)$ happens to be 17 choose 14, don't you think it is the same for $N(C_2)$ as well, because $X_1 + X_2 + X_3 + X_4 = 25$ with X_2 at least 11, is the same as removing 11 from both the sides, right, and making the equation as $X_1 + X_2 + X_3 + X_4 = 14$, I have turned down earlier question to this question and hence it happens to be 17 choose 14 the answer, the same for $N(C_3)$ and $N(C_4)$ as well.

(Refer Slide Time: 04:16)

IIT
Ropar

$$N(C_2) = ?$$

$$x_1 + x_2 + x_3 + x_4 = 25 ; x_1 \geq 0, x_2 \geq 11, x_3 \geq 0, x_4 \geq 0$$

Same as

$$x_1 + x_2 + x_3 + x_4 = 14 ; x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

$$N(C_2) = \binom{4+14-1}{4} = \binom{17}{14} = N(C_3) = N(C_4)$$

Now when it comes to $N(C_1)(C_2)$, how do we do it? The solution must have X_1 at least 11, and X_2 at least 11, we want such solutions, right, now $X_1 + X_2 + X_3 + X_4 = 25$ this can be turned down to the equation, $X_1 + X_2 + X_3 + X_4$ removing 22 from RHS, it becomes 3 here, right, how do we, we need solutions for this equation,

(Refer Slide Time: 04:52)

$$N(C_1, C_2) = ?$$

Solution must have x_1 at least 11 and
 x_2 at least 11.

$$x_1 + x_2 + x_3 + x_4 = 25 ; x_1 \geq 11, x_2 \geq 11, x_3 \geq 0, x_4 \geq 0$$

Same as

$$x_1 + x_2 + x_3 + x_4 = 3 ; x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

now if I enumerate the possibilities of solutions for this equation, it happens to be something like this, 1 1 1 0, 1 1 0 1, 0 1 1 1, 1 0 1 1, 2 1 0 0, 1 2 0 0, and so on,
(Refer Slide Time: 05:11)

$$N(C_1, C_2) = ?$$

Solution must have x_1 at least 11 and
 x_2 at least 11.

$$x_1 + x_2 + x_3 + x_4 = 25 ; x_1 \geq 11, x_2 \geq 11, x_3 \geq 0, x_4 \geq 0$$

Same as

$$x_1 + x_2 + x_3 + x_4 = 3 ; x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

$$1 + 1 + 1 + 0 = 3$$

$$1 + 0 + 1 + 1 = 3$$

$$1 + 1 + 0 + 1 = 3$$

$$2 + 1 + 0 + 0 = 3$$

$$0 + 1 + 1 + 1 = 3$$

$$1 + 2 + 0 + 0 = 3$$

⋮

now the possibilities for $X_1 + X_2 + X_3 + X_4 = 25$ with X_1 and X_2 at least 11, if I write the possibilities for this, some of them are like this, $11 + 11 + 3 + 0$, $11 + 11 + 0 + 3$, $12 + 11 + 2 + 0$, $12 + 11 + 0 + 2$, and so on, now there is a proper bijection between the enumerations of this equation and this equation, let me show you a few of them, 11 will go to 0, so $11 + 11 + 3 + 0$ will be mapped to $0 + 0 + 3 + 0$.

Now $12 + 11 + 2 + 0$ will be mapped to $1 + 0 + 2 + 0$ and so on, and hence between all the enumerations of this equation and this equation there is a proper bijection, if you are interested you can take some pause of like say 10 to 15 minutes, write down all the enumerations of both the equations and you can yourself find out the proper bijection,

(Refer Slide Time: 06:34)

| $x_1 + x_2 + x_3 + x_4 = 25 ;$ $x_1 \geq 11, x_2 \geq 11, x_3 \geq 0, x_4 \geq 0$ | $x_1 + x_2 + x_3 + x_4 = 3 ;$ $x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$ |
|--|---|
| $11 + 11 + 3 + 0$ | $0 + 0 + 3 + 0$ |
| $11 + 11 + 0 + 3$ | |
| $12 + 11 + 2 + 0$ | $1 + 0 + 2 + 0$ |
| $12 + 11 + 0 + 2$ | |
| \vdots | |
| \vdots | |

Bijection

this can be followed for $N(C_1)$ and $N(C_2)$ as well, like for $N(C_i)$'s when I turn down the given equation to another equation I can always give you a bijection between the 2 equations, the possibilities, there is always a bijection,

(Refer Slide Time: 06:50)

$$N(C_1, C_2) = ?$$

Solution must have x_1 at least 11 and
 x_2 at least 11.

$$x_1 + x_2 + x_3 + x_4 = 25 ; x_1 \geq 11, x_2 \geq 11, x_3 \geq 0, x_4 \geq 0$$

Same as

$$x_1 + x_2 + x_3 + x_4 = 3 ; x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

$$N(C_1, C_2) =$$

like how I stated just now, you can try it out yourself, so the number of possibilities for $x_1 + x_2 + x_3 + x_4 = 3$ happens to be $4 + 3 - 1$ choose 3, which is 6 choose 3 that is $6 \times 5 \times 4 / 6$ which is 20, right.

(Refer Slide Time: 07:11)

$$N(C_1, C_2) = ?$$

Solution must have x_1 at least 11 and
 x_2 at least 11.

$$x_1 + x_2 + x_3 + x_4 = 25 ; x_1 \geq 11, x_2 \geq 11, x_3 \geq 0, x_4 \geq 0$$

Same as

$$x_1 + x_2 + x_3 + x_4 = 3 ; x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

$$N(C_1, C_2) = \binom{4+3-1}{3} = \binom{6}{3} = \frac{6 \times 5 \times 4}{6} = 20$$

Now $N(C_2, C_3)$ will also be the same, it is 6 choose 3, why? Because $N(C_1, C_2)$ or $X_1 + X_2 + X_3 + X_4 = 25$ with X_2 and X_3 being at least 11, it's the same as $X_1 + X_2 + X_3 + X_4 = 3$, just like the previous one,
(Refer Slide Time: 07:42)

$$N(C_2, C_3) = \binom{6}{3}$$

Solution must have x_2 at least 11 and x_3 at least 11.

$$x_1 + x_2 + x_3 + x_4 = 25 ; x_1 \geq 0, x_2 \geq 11, x_3 \geq 11, x_4 \geq 0$$

Same as

$$x_1 + x_2 + x_3 + x_4 = 3 ; x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

it is the same equation and hence it is 6 choose 3 for all the 6 possibilities, $N(C_1, C_2)$, $N(C_2, C_3)$, $N(C_3, C_1)$, $N(C_1, C_4)$, $N(C_2, C_4)$ and $N(C_3, C_4)$, right, so all of these are 6 choose 3.
(Refer Slide Time: 07:59)

$$N(C_2C_3) = \binom{6}{3} = N(C_3C_1) = N(C_1C_4) = N(C_2C_4) = N(C_3C_4)$$

Solution must have x_2 at least 11 and
 x_3 at least 11.

$$x_1 + x_2 + x_3 + x_4 = 25 ; x_1 \geq 0, x_2 \geq 11, x_3 \geq 11, x_4 \geq 0$$

Same as

$$x_1 + x_2 + x_3 + x_4 = 3 ; x_1 \geq 0, x_2 \geq 0, x_3 \geq 0, x_4 \geq 0$$

Now what would happen to (C_1, C_2, C_3) ? The number of possibilities of (C_1, C_2, C_3) will be, you see all of these 3 should happen, that is X_1 must be at least 11, X_2 must be at least 11, and X_3 must be at least 11, well, will this ever happen? Because the moment I give, just 11, well just 11 as the value to X_1, X_2 and X_3 we get 33 as the answer and I'm not even reached X_4 , and hence $N(C_1, C_2, C_3)$ is 0, the same holds true for (C_2, C_3, C_4) (C_1, C_2, C_4) and all of them, (Refer Slide Time: 08:42)

$$N(C_1 C_2 C_3) = 0 = N(C_2 C_3 C_4) = N(C_1 C_2 C_4) = \dots$$

Solution must have x_1 at least 11, x_2 at least 11 and x_3 at least 11.

$$\boxed{11 + 11 + 11} + x_4 = 25$$

33

X

$N(C_i, C_j, C_k)$ is 0, i, j, k lying between 1 to 4, now if this is 0 what will happen to C_1, C_2, C_3, C_4 it is very obvious that they will be 0 as well, you can try it out yourself, so $N(C_i, C_j, C_k, C_l)$ is 0 for all i, j, k, l lying between 1 to 4,
(Refer Slide Time: 09:16)

$$N(C_1 C_2 C_3 C_4) = 0$$

$$N(C_i C_j C_k C_l) = 0 \quad 1 \leq i, j, k, l \leq 4$$

so what is the final answer? We wanted those enumerations or possibilities where XI's lie between 0 to 10, so the answer is $N(\bar{C}_1, \bar{C}_2, \bar{C}_3, \bar{C}_4)$, if $N(C_i, C_j, C_k)$ and $N(C_i, C_j, C_k, C_l)$ is 0 we need not consider them, right, in the formula, and the final formula they need not consider, so the simplified version goes like this, $N(\bar{C}_1, \bar{C}_2, \bar{C}_3, \bar{C}_4) = N - N(C_1) + N(C_2) + N(C_3) + N(C_4) - N(C_1, C_2) + N(C_2, C_3) + N(C_3, C_4) + N(C_1, C_3) + N(C_1, C_4) + N(C_2, C_4)$ which is nothing but S naught, - S1, + S2, S3 and S4 are 0, so I am not considering them, +S2, S2 is what? $N(C_1, C_2)$, $N(C_2, C_3)$ and so on, right.

So now N is 28 choose 25, all possibilities that is S naught, S1 happens to be 4 times 17 choose 14,

(Refer Slide Time: 10:28)

$$\begin{aligned}
 N(\bar{C}_1, \bar{C}_2, \bar{C}_3, \bar{C}_4) &= N - [N(C_1) + N(C_2) + N(C_3) \\
 &\quad + N(C_4)] + [N(C_1, C_2) + \\
 &\quad N(C_2, C_3) + N(C_3, C_4) + N(C_1, C_3) \\
 &\quad + N(C_1, C_4) + N(C_2, C_4)] \\
 &= \binom{28}{25} - \left[4 \binom{17}{14} \right]
 \end{aligned}$$

rather I can tell it as 4 choose 1 times 17 choose 14, and S2 happens to be 4 choose 2, or 6 times 6 choose 3, so the final answer goes like this, 28 choose 25 - 4 choose 1 x 17 choose 14 + 4 choose 2 x 6 choose 3.

(Refer Slide Time: 10:48)

$$\begin{aligned}
 N(\bar{C}_1 \bar{C}_2 \bar{C}_3 \bar{C}_4) &= N - [N(C_1) + N(C_2) + N(C_3) \\
 &\quad + N(C_4)] + [N(C_1 C_2) + \\
 &\quad N(C_2 C_3) + N(C_3 C_4) + N(C_1 C_3) \\
 &\quad + N(C_1 C_4) + N(C_2 C_4)] \\
 &= \binom{28}{25} - \left[\binom{4}{1} \binom{17}{14} \right] + \left[\binom{4}{2} \binom{6}{3} \right]
 \end{aligned}$$
