

Human Multimodal Interaction
Professor Doctor Sebastian Moller
Quality and Usability Lab
Technische Universität Berlin
Introduction

(Refer Slide Time: 00:13)

In the chapter Human Multimodal Interaction you obtain an overview over the major classes of multimodality in interaction. Here the focus is on non-speech social signals. The take home messages of this chapter are as follows.

Human communicative and social signals are represented on many different channels. All the presented classes of signals have potential to make computers more intelligent, that is to interpret and act according for example to space, attitudes or emotions. You will also learn that most social signals are culturally differently defined.
