Lecture No 2

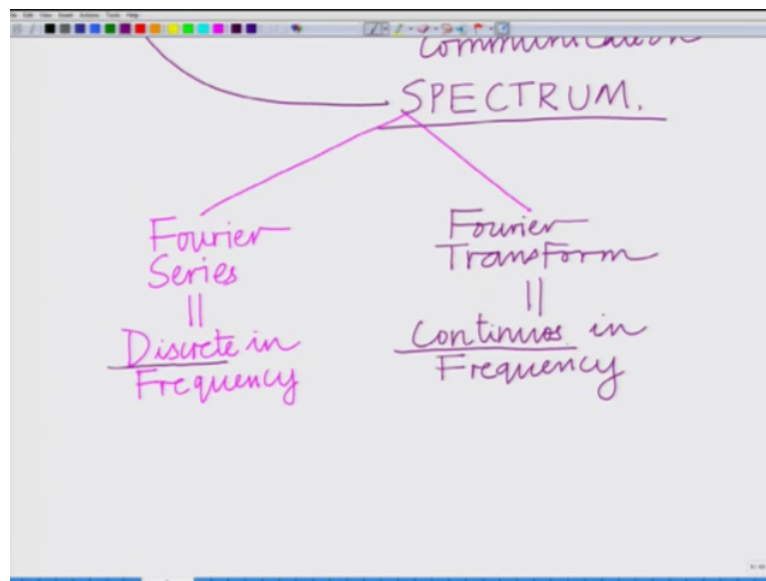

Frequency Domain Representation and Introduction to Discrete Fourier series

(Refer Slide Time: 0:38)

Hello, welcome to another module in this massive open online course, so today's let us start looking at the frequency domain representation of signals, alright. So today we will start looking at, what is known as and what you must be familiar with to some extent the frequency domain representation of signals. So we are going to look at the frequency domain representation, alright and this is 1 of the fundamental tools in communication, the frequency domain representation is 1 of the fundamental tools available. This is 1 of the fundamental tools required or 1 of the fundamental tools used in communication and this frequency domain representation of the signal is termed as the spectrum of the signal.

(Refer Slide Time: 2:04)

So this is termed as the frequency domain signal representation is termed as the spectrum right, the spectrum of the signal. And further this spectrum can be of 2 types, 1 is we can have a Fourier series which is discrete in frequency, this Fourier series is discrete in frequency and the other representation is the Fourier transform and this Fourier transform this is continuous so we have the Fourier series which is discrete the Fourier transform which is continuous in frequency.

So this way we have to different kinds of, of course we have more kinds of signal or spectrum or frequency domain representation, but for the purpose of this particular course, these 2 are going to be sufficient, 1 is the Fourier series which is discrete in frequency we are going to look at it in greater detail and the other is the Fourier transform which is continuous in the frequency domain. First let us start looking at the Fourier series representation, okay.

(Refer Slide Time: 3:55)

So we start by looking at the Fourier, we start by looking let us start by looking at the Fourier series and the Fourier series is defined it is important to remember this is defined for a periodic signal. This is defined for a periodic signal $x(t)$, so let us consider $x(t)$ to be a periodic signal, so consider $x(t)$ to be a periodic signal with period capital T , alright. So $x(t)$ is a periodic signal, alright we all are familiar with the notion of a periodic signal, so consider $x(t)$ to be a periodic signal with period capital T , okay.

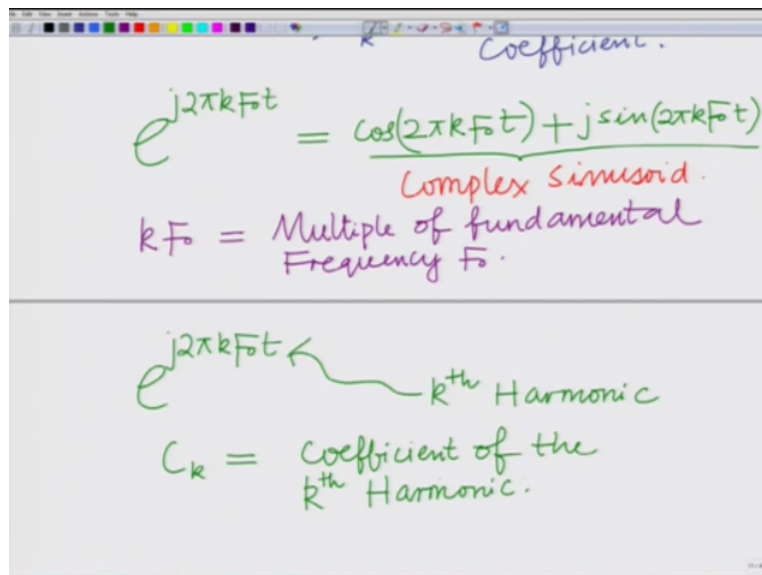

(Refer Slide Time: 7:59)

Now the Fourier series of $x(t)$ is given as $x(t)$ this is given as let us write this down $x(t)$ equals to summation k equals to minus infinity to infinity, so let me just write it a bit more clearly this is summation k equals to minus infinity to infinity $C_k e$ to the power of $j 2 \pi k F_0 t$,

where F_0 equals to 1 over the time period, remember capital T this is the time period of the periodic signal F_0 equals to 1 over the T this is termed as the fundamental frequency. F_0 is the fundamental frequency of periodic signal, $x(t)$, okay.

And this is the Fourier series representation correct, C_k e to the power of $j 2 \pi k F_0 t$ and this quantity C_k is the kth Fourier series coefficient. This quantity C_k , alright the summation C_k e to the power of $j 2 \pi k F_0 t$, F_0 is the fundamental frequency which is 1 over T, where T is a time period of the periodic signal and F_0 is the fundamental frequency, right? And C_k is the Kth discrete Fourier series coefficient of this periodic signal $x(k)$ okay.

(Refer Slide Time: 8:40)

Handwritten notes on a digital whiteboard explaining the Fourier series representation. The top section shows the equation $e^{j2\pi k F_0 t} = \cos(2\pi k F_0 t) + j \sin(2\pi k F_0 t)$, with "Coefficient." written above and "Complex Sinusoid." written below. Below this, it states " $k F_0 = \text{Multiple of fundamental Frequency } F_0$." The bottom section shows the same equation $e^{j2\pi k F_0 t}$ with an arrow pointing to it from the text " k^{th} Harmonic", and below that, " $C_k = \text{Coefficient of the } k^{\text{th}} \text{ Harmonic}.$ "

And now look at this, now let us try to understand this a little bit better if you look at this quantity e to the power of $j 2 \pi k F_0 t$, look at this quantity e to the power of $j 2 \pi k F_0 t$ this is equals to cosine, e to the power of $j \theta$ is cosine θ + j sine θ . So this is cosine $2 \pi k F_0 t$ + j sine $2 \pi k F_0 t$ and this is also, this is basically a complex Sinusoid, correct? Remember we said cosines and sines of Sinusoid, so cosine $2 \pi k F_0 t$ + j sine $2 \pi k F_0 t$ is a complex Sinusoid. So what we are saying is that we can look at this, the summation C_k e to the power of $j 2 \pi k F_0 t$ is basically nothing but a linear combination of Sinusoids at the fundamental frequency F_0 and multiples $k F_0$ of the fundamental frequency, alright.

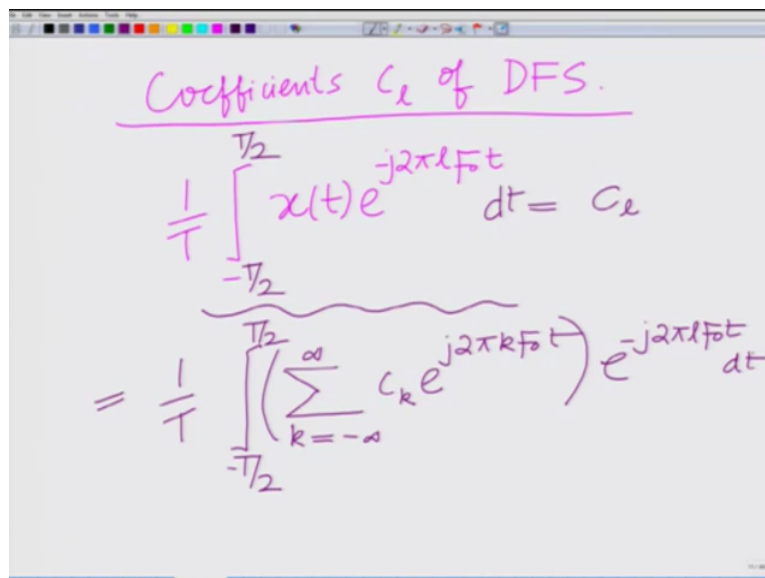

So what we are saying is if you can look at it, each $k F_0$ is equals to a multiple of fundamental, this is a multiple of the fundamental frequency F_0 the kth multiple of the fundamental frequency F_0 , correct? So summation C_k e to the power of $j 2 \pi k F_0 t$ is

basically nothing but a linear combination of these various complex Sinusoids, at either frequency F_0 or $k F_0$, $k F_0$ is basically a multiple of the fundamental frequency F_0 .

So this is a linear combination, so what we are saying is every periodic signal $x(t)$ with period with fundamental frequency F_0 can be expressed as an infinite as a as a linear combination of an infinite number of Sinusoids at either the fundamental of frequency of F_0 or an integer multiple of the fundamental frequency F_0 that is at $k F_0$, alright. And that is the power of all that is the intuitive explanation of this discrete Fourier of the discrete Fourier series expansion of a periodic signal $x(t)$, okay.

And this Sinusoid at $k F_0$, that is this Sinusoid and $k F_0$ that is e to the power of $j 2 \pi k F_0 t$, correct? This Sinusoid that is Sinusoid at integer multiple of F_0 t this is termed as the k th harmonic and C_k is basically the cominusefficient of the k th harmonic in the linear combination. So C_k is the cominusefficient of the K th, so e to the power of $j 2 \pi k F_0 t$ is $k F_0 t$ is the k th harmonic, correct, which is associated the k th multiple of the fundamental frequency F_0 and C_k is the discrete Fourier series cominusefficient associated with the k th harmonic in this discrete Fourier series expansion, okay.

(Refer Slide Time: 12:18)

The image shows a handwritten derivation of the discrete Fourier series coefficient C_k . The title is "Coefficients C_k of DFS." The first equation is
$$\frac{1}{T} \int_{-T/2}^{T/2} x(t) e^{j2\pi k F_0 t} dt = C_k$$
 The second equation is
$$= \frac{1}{T} \int_{-T/2}^{T/2} \left(\sum_{k=-\infty}^{\infty} C_k e^{j2\pi k F_0 t} \right) e^{-j2\pi k F_0 t} dt$$

Now, let us look at how to find out the cominusefficient C_k in the discrete Fourier series, okay. so let us now look at cominusefficient, how to find the coefficients C_k of the discrete Fourier series? Let us try to make it CL since we are already using k as the index of the discrete Fourier series. Now we will show let us consider this quantity integral 1 over T minus infinity to T $x(t)$ e to the power of j minus $j 2 \pi L F_0 t$, we will show that this quantity

this integral here boils down to yield the Lth cominusefficient CL of the discrete Courier series. For that what I am going to do is I am going to substitute the expansion minus infinity to infinity summation, I am sorry this integral is from is over 1 period, so that is from minus T over 2 to capital T over 2 minus T over 2 to T over 2 summation k equals to minus infinity to infinity $C_k e^{j 2 \pi k F_0 t}$, correct, Multiplied by $e^{-j 2 \pi L F_0 t}$ times dt.

(Refer Slide Time: 14:28)

$$= \frac{1}{T} \int_{-T/2}^{T/2} \left(\sum_{k=-\infty}^{\infty} C_k e^{j 2 \pi k F_0 t} \right) e^{-j 2 \pi L F_0 t} dt$$

Interchange summation & integration

$$= \sum_{k=-\infty}^{\infty} C_k \cdot \frac{1}{T} \int_{-T/2}^{T/2} e^{j 2 \pi (k-L) F_0 t} dt$$

Now interchange the summation and integration that is interchange summation and or rather interchange order of summation and integration and that yields take the summation outside that gives k equals to minus infinity to infinity, correct? C_k times $\frac{1}{T}$ integral minus T by 2 to T by 2 $e^{j 2 \pi k F_0 t}$ dt. Now let us look at this integral $\frac{1}{T}$ integral minus T by 2 to T by 2 $e^{j 2 \pi (k-L) F_0 t}$ dt let us take look at this integral, let us try to infer the properties or let us try to find out the properties of this integral and we will see that this is a very interesting property, that is let us look at this integral $\frac{1}{T}$ integral minus T by 2 to T by 2 $e^{j 2 \pi (k-L) F_0 t}$ dt.

(Refer Slide Time: 16:06)

$$\begin{aligned}
 & \frac{1}{T} \int_{-T/2}^{T/2} e^{j2\pi(k-l)F_0 t} dt \\
 & \xrightarrow{k=l} \frac{1}{T} \int_{-T/2}^{T/2} 1 \cdot dt = \frac{1}{T} \cdot T = 1
 \end{aligned}$$

Now if k equals to L then e to the power of k minus L equals to 0, so e to the power of $j 2 \pi k$ minus $L F_0 t$ that is e to the power 0 that is 1, so this integral becomes, if k equals to L this integral becomes integral 1 over T minus T by 2 to T by 2 1 times dt , which is 1 over T times T , so this is 1. So what we are saying is if k is equals to L then 1 over T integral minus T over 2 to T over 2 e to the power of $j 2 \pi k$ minus $L F_0 dt$ is 1.

(Refer Slide Time: 17:08)

$$\begin{aligned}
 & \text{If } k \neq l \\
 & = \frac{1}{T} \int_{-T/2}^{T/2} e^{j2\pi(k-l)F_0 t} dt \\
 & = \frac{1}{T} \cdot \frac{e^{j2\pi(k-l)F_0 t}}{j2\pi(k-l)F_0} \bigg|_{-T/2}^{T/2} \quad \text{Use property } F_0 = \frac{1}{T} \Rightarrow F_0 T = 1 \\
 & = \frac{1}{T} \cdot \frac{1}{j2\pi(k-l)F_0} \left\{ e^{j\pi(k-l)} - e^{-j\pi(k-l)} \right\}
 \end{aligned}$$

Now if k is not equals to l , that is k minus L is not equals to 0 then this integral becomes 1 over T , well let me just write it again minus T by 2 to T by 2 e to the power of $j 2 \pi k$ minus $L F_0 t$ dt, so k minus L is not equals to 0 which means I can now evaluate this integral as 1

over T e to the power of $j 2 \pi k \text{ minus } L F_0 t$ divided by $j 2 \pi k \text{ minus } L F_0$ between the limits minus T by 2 to T by 2, which is equals to $1 \text{ over } T$ $1 \text{ over } j 2 \pi k \text{ minus } L F_0$.

Now e to the power of $j 2 \pi k \text{ minus } L F_0 t$ evaluated with capital T by 2 using the property, use property remember we have to use the property F_0 equals to $1 \text{ by } T$ which implies $F_0 T$ equals to 1. So using this property this becomes e to the power of $j 2 \pi k \text{ minus } L F_0$ into T by 2 $F_0 T$ is 1, so this becomes $\pi K \text{ minus } L$ minus e to the power of minus $j \pi$ at minus T by 2 it becomes e to the power of minus $j \pi k \text{ minus } l$. Now look at this, this is a Sinusoid evaluated at phase $\pi k \text{ minus } L$ and phase minus $\pi k \text{ minus } l$. The difference between the 2 phases is 2π times $k \text{ minus } L$ that is integer multiple of 2π , therefore these 2 complex Sinusoids are equal hence the difference is 0.

(Refer Slide Time: 19:48)

The image shows a digital whiteboard with handwritten mathematical derivations in purple ink. The derivations are as follows:

$$= \frac{1}{T} \cdot \frac{e^{j 2 \pi (k-l) F_0 t}}{j 2 \pi (k-l) F_0} \Big|_{-T/2}^{T/2}$$

Use property $F_0 = \frac{1}{T} \Rightarrow F_0 T = 1$

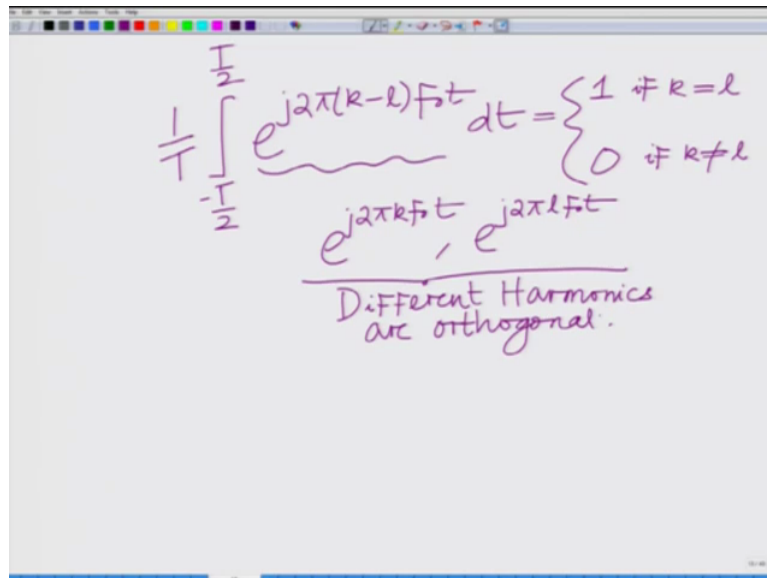

$$= \frac{1}{T} \cdot \frac{1}{j 2 \pi (k-l) F_0} \left\{ e^{j \pi (k-l)} - e^{-j \pi (k-l)} \right\}$$

$\Delta \phi = \text{Phase Diff} = 2 \pi (k-l)$
 $T/2 \rightarrow 0$

If $k \neq l$ $\frac{1}{T} \int_{-T/2}^{T/2} e^{j 2 \pi (k-l) F_0 t} dt = 0$

So phase difference equals to $2 \pi k \text{ minus } L$ which means this quantity, here this is equals to 0 therefore if k is not equals to L therefore to summarize if k is not equals to L then $1 \text{ over } T$ integral minus T by 2 to T by 2 e to the power of $j 2 \pi k \text{ minus } L F_0 t$ is equals to 0, okay.

(Refer Slide Time: 20:20)

$$\frac{1}{T} \int_{-\frac{T}{2}}^{\frac{T}{2}} e^{j2\pi(k-l)F_0 t} dt = \begin{cases} 1 & \text{if } k=l \\ 0 & \text{if } k \neq l \end{cases}$$

$e^{j2\pi k F_0 t}, e^{j2\pi l F_0 t}$

Different Harmonics are orthogonal.

So what we have shown is that this quantity $\frac{1}{T} \int_{-\frac{T}{2}}^{\frac{T}{2}} e^{j2\pi(k-l)F_0 t} dt$, this is equals to 1 if k equals to l , 0 if k for all integers k not equals to l this is 0, okay. So and this is an incredible property that is if you can look at this, shows nothing but the fact that these different harmonics $e^{j2\pi k F_0 t}$, $e^{j2\pi l F_0 t}$, these are orthogonal the k th harmonic and l th harmonic, these different harmonics that is $e^{j2\pi k F_0 t}$, $e^{j2\pi l F_0 t}$ when k is not equal, these different harmonics there are different harmonics right, at different multiples of F_0 $k F_0$ and $l F_0$ are orthogonal that is why you have $\frac{1}{T} \int_{-\frac{T}{2}}^{\frac{T}{2}} e^{j2\pi k F_0 t} \times e^{-j2\pi l F_0 t} dt$ that is equals to 0.

(Refer Slide Time: 22:21)

$$\frac{1}{T} \int_{-T/2}^{T/2} x(t) y^*(t) dt = 0$$

$$\frac{1}{T} \int_{-T/2}^{T/2} e^{j2\pi k F_0 t} \cdot (e^{j2\pi l F_0 t})^* dt = 0$$

ORTHOGONAL

That is property, let me just write it again Clearly to illustrate the orthogonality. We say $x(t)$ and $y(t)$ are orthogonal if this dot product or the inner product minus 1 over T minus T by 2 $x(t)$ into y conjugate (t) dt is equals to 0. Here we have integral minus T over 2 to T over 2 1 over T e to the power of $j 2 \pi k F_0 T$ times e to the power of minus j times e to the power of $j 2 \pi l F_0 t$ conjugate into dt equals to 0, hence these 2 are, in fact, there is a very important property, these 2 are that is the different harmonics at $k F_0$ and harmonics at $l F_0$, the k th harmonic and l th harmonic are orthogonal.

(Refer Slide Time: 23:51)

$$\frac{1}{T} \int_{-T/2}^{T/2} \sum_{k=-\infty}^{\infty} c_k e^{j2\pi(k-l)F_0 t} dt$$

Interchange summation & integration

$$= \sum_{k=-\infty}^{\infty} c_k \frac{1}{T} \int_{-T/2}^{T/2} e^{j2\pi(k-l)F_0 t} dt$$

$$\frac{1}{T} \int_{-T/2}^{T/2} e^{j2\pi(k-l)F_0 t} dt$$

ORTHOGONAL

$$\frac{1}{T} \int_{-T/2}^{T/2} x(t) e^{-j2\pi l F_0 t} dt = \sum_{k=-\infty}^{\infty} c_k \cdot \frac{1}{T} \int_{-T/2}^{T/2} e^{j2\pi(k-l)F_0 t} dt$$

$\begin{matrix} 0 & \text{if } k \neq l \\ 1 & \text{if } k = l \end{matrix}$

$$= \sum_{k=-\infty}^{\infty} c_k \cdot \delta(k-l)$$

$\int = c_l$

And we will now use this property to evaluate C_k and that can be simply shown as follows because look at this if you go back here, this integral alright. Let us go back to this integral that is summation we have shown that $\frac{1}{T} \int_{-T/2}^{T/2} x(t) e^{-j2\pi l F_0 t} dt$, this is equals to summation k equals to minus infinity to infinity C_k times $\frac{1}{T} \int_{-T/2}^{T/2} e^{j2\pi(k-l)F_0 t} dt$, this integral is nonzero this integral is 0. If this integral is 0 if k not equals to l , 1 if k equals to l . So it is going to survive only when k equals to l . So only the term corresponding to C_l is going to remain and therefore this is simply equals to.

(Refer Slide Time: 26:30)

$\sum_{k=-\infty}^{\infty} c_k \cdot \delta(k-l)$

$\frac{1}{T} \int_{-T/2}^{T/2} x(t) e^{-j2\pi l F_0 t} dt = c_l$

Coefficient of l^{th} Harmonic

You can also write this as summation k equals to minus infinity to infinity $C_k \delta(k-l)$ because this is a delta function with $\delta(0)$ is 1 and $\delta(N)$ is 0 if N is

not equals to 0 that is basically therefore this is basically simply equals to your CL, okay. So fourth we have is basically that completing this we have integral $x(t) e^{-j 2 \pi L F_0 t}$ equals to CL. That is the cominusefficient of the where CL is cominusofficiate of Lth harmonic or Lth cominusefficient in discrete Fourier series representation of $x(t)$ or the Lth of coefficient in the discrete Fourier Lth cominusefficient in discrete Fourier series representation of $x(t)$ or rather let us characterize this or let us qualify this as a periodic signal x of the representation of the periodic signal $x(t)$, correct, Lth coefficient in the discrete Fourier series representation of the periodic signal $x(t)$.

So what we have done so far is what we have done in this module is basically we have started to look at the Fourier domain or Frequency domain representation of the signal $x(t)$, looked at the Fourier discrete Fourier series representation of a periodic signal $x(t)$. We said that any periodic signal $x(t)$ can be represented as with fundamental frequency F_0 , where F_0 equals to $1/T$ where capital T is the period of the signal can be represented as the summation or the linear combination of a infinite number of complex Sinusoids at the fundamental frequency F_0 and multiples of the fundamental frequency that is $k F_0$, that is the Sinusoid corresponding to the complex Sinusoid corresponding to the fundamental frequency F_0 and its various harmonics, correct.

And we have also shown how to compute the discrete Fourier series cominusefficient C_k corresponding to kth harmonic in this discrete Fourier series representation. So we will stop this module here and continue with other aspects in the subsequent modules, thank you very much.
