**Lecture 09: Example for Auto-correlation of Signal and Energy Spectral Density (ESD)**

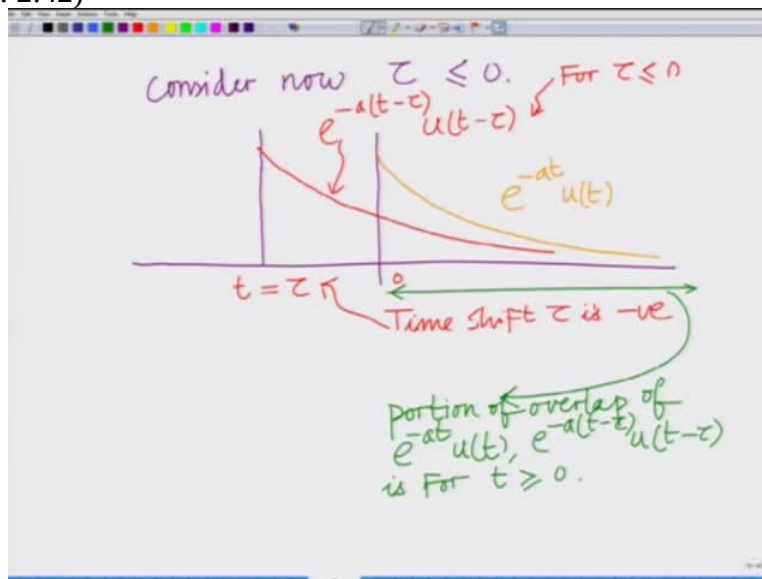

Hello, welcome to another module in this massive open online course. So let us continue our discussion on the auto correlation on energy spectral density and we are looking at the auto correlation of this function  $e^{-at} u(t)$ .

(Refer Slide Time: 0:29)

And this is the particular signal that we are looking at which is  $e^{-a(t-\tau)} u(t-\tau)$  and we have already seen that if  $\tau$  is greater than or equal to zero then  $R11$   $\tau$  equals we have seen that  $R11$   $\tau$  equals  $1/\sqrt{2} a e^{-a\tau}$ . Let us now consider the scenario consider now  $\tau$  less than or equal to zero, with  $\tau$  less than or equal to zero we have  $e^{-a(t-\tau)} u(t-\tau)$  and now if  $\tau$  less than or equal to zero the shift is towards the left and therefore the resulting signal is going to look like this that is, it is going to look like  $e^{-a(t-\tau)} u(t-\tau)$  for  $\tau$  less than or equal to zero, that is the shift  $t$  equal to  $\tau$  is negative, okay. So the time shift  $\tau$  is negative.

(Refer Slide Time: 2:42)

And now therefore if you can see the overlap that is this portion the overlap of the 2 exponentials portion of overlap of  $e^{-a(t-\tau)} u(t-\tau)$  and  $e^{-at} u(t)$  is for  $t$  greater than or equal to  $\tau$  that is the portion where there is 2 signals that is  $e^{-a(t-\tau)} u(t-\tau)$  and  $e^{-at} u(t)$  overlap is for all  $t$  greater than or equal to zero that is the portion where this the period that is the the portion where they overlap implying the portion where the product of both these signals is nonzero.

(Refer Slide Time: 3:45)

portion of overlap of  
 $e^{-at}u(t)$ ,  $e^{-a(t-\tau)}u(t-\tau)$   
is for  $t \geq 0$ .

$$R_{||}(z) = \int_{-\infty}^{\infty} x(t) x(t-\tau) dt$$
$$= \int_{-\infty}^{\infty} e^{-at} u(t) e^{-a(t-\tau)} u(t-\tau) dt$$

$$= \int_{-\infty}^{\infty} e^{-at} u(t) e^{-a(t-\tau)} u(t-\tau) dt$$

Non-zero only for  $t \geq 0$

$$= \int_0^{\infty} e^{-at} e^{-a(t-\tau)} dt$$

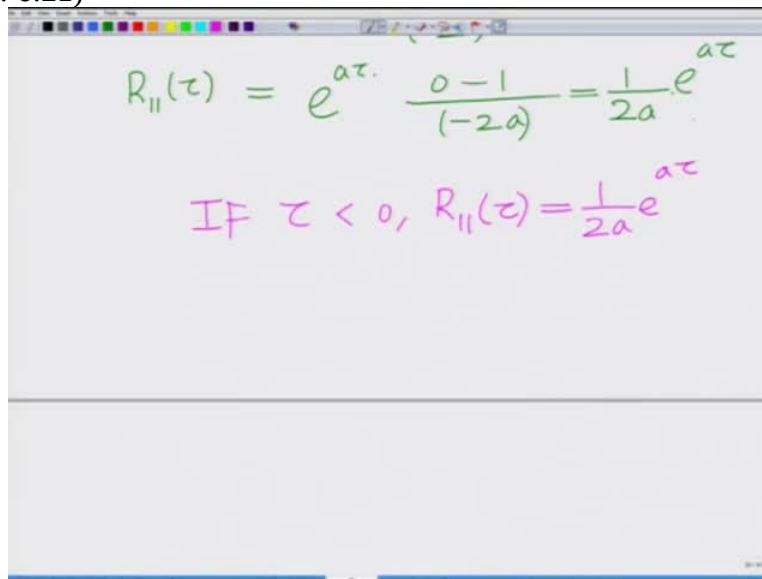

$$\begin{aligned}
 &= e^{a\tau} \int_0^{\infty} e^{-2at} dt \\
 &= e^{a\tau} \cdot \frac{1}{(-2a)} e^{-2at} \Big|_0^{\infty} \\
 &= e^{a\tau} \cdot \frac{0 - 1}{(-2a)} = \frac{1}{2a} e^{a\tau}
 \end{aligned}$$

Therefore remember, our definition is  $\int_{-\infty}^{\infty} x(t) \delta(t - \tau) dt$  and this is equal to  $\int_{-\infty}^{\infty} e^{-a(t - \tau)} u(t - \tau) dt$ . This is nonzero only for  $t$  greater than or equal to  $\tau$ . So therefore this is equal to  $\int_{\tau}^{\infty} e^{-a(t - \tau)} dt$  which is equal to  $e^{a\tau} \int_0^{\infty} e^{-2at} dt$  which is equal to  $\frac{1}{2a} e^{a\tau}$ .

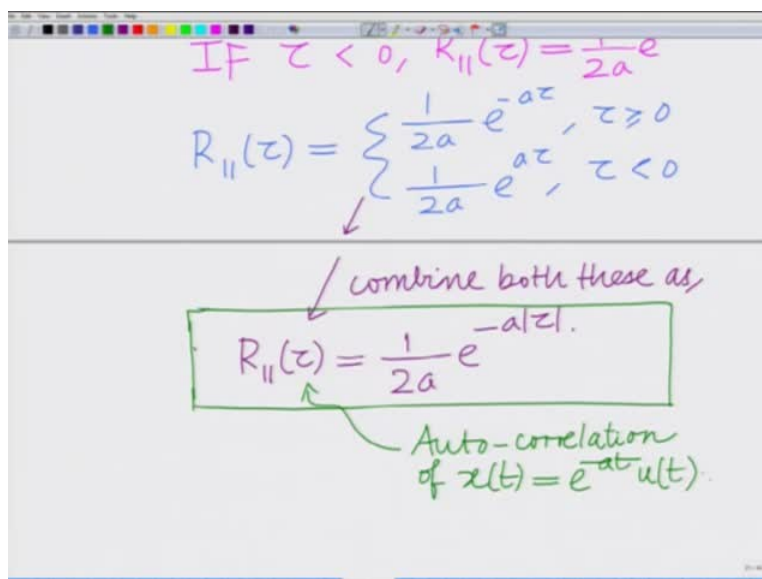

So this is, this does not depend on  $t$  so this comes out of the integral. This is  $\int_0^{\infty} e^{-2at} dt$  which is equal to  $\frac{1}{-2a} e^{-2at} \Big|_0^{\infty}$  equals  $\frac{1}{-2a} (0 - 1)$  equals  $\frac{1}{2a}$ .

I am sorry this has to be  $e^{a\tau}$ ,  $e$  to the power of  $a\tau$  so this has to be  $e^{a\tau}$ , okay.

(Refer Slide Time: 6:21)

Handwritten derivation of  $R_{11}(z)$  for  $z \geq 0$ . The first line shows the calculation of the integral:  $R_{11}(z) = e^{az} \cdot \frac{0-1}{(-2a)} = \frac{1}{2a} e^{az}$ . The second line states the result for  $z < 0$ :  $\text{If } z < 0, R_{11}(z) = \frac{1}{2a} e^{az}$ .

Handwritten piecewise definition of  $R_{11}(z)$ :  $R_{11}(z) = \begin{cases} \frac{1}{2a} e^{-az}, & z \geq 0 \\ \frac{1}{2a} e^{az}, & z < 0 \end{cases}$ . Below this, a note says "combine both these as," pointing to a boxed equation:  $R_{11}(z) = \frac{1}{2a} e^{-a|z|}$ . A final note points to the boxed equation: "Auto-correlation of  $x(t) = e^{at} u(t)$ ."

So this is you can see  $R_{11}(z)$  if so this is basically your  $R_{11}(z)$  so if  $z \leq 0$  or  $z < 0$   $R_{11}(z)$  equals  $\frac{1}{2a} e^{az}$ , okay. So therefore now we have derived  $R_{11}(z)$  corresponding to both the regions of  $z$  that is if  $z$  is greater than or equal to zero it is  $\frac{1}{2a} e^{-az}$ , if  $z$  is less than zero then it is  $\frac{1}{2a} e^{az}$  to the power of  $z$ .

Therefore we have, so we have to summarize  $R_{11}(z)$  equals  $\frac{1}{2a} e^{-a|z|}$  if  $z$  is greater than or equal to zero this is  $\frac{1}{2a} e^{az}$  if  $z$  is less

than zero and now you can see I can combine both these I can combine both these as  $R_{11}(\tau)$  equals  $\frac{1}{2a} e^{-a|\tau|}$ .

So the I can combine this I can combine both these as  $\frac{1}{2a} e^{-a|\tau|}$ , that is the auto correlation function of this signal  $e^{-at} u(t)$ , okay. So this is the auto correlation this is the auto correlation of the signal  $x(t)$  equals  $e^{-a(t)} u(t)$ .

(Refer Slide Time: 8:54)

And it looks as follows, it is  $\frac{1}{2a} e^{-a|\tau|}$  so it is basically nonzero, this is nonzero and decaying exponential that is this is basically, let me draw it with the same colour this is basically decaying exponential on both axis that is this is your  $e^{-a|\tau|}$  so this is on the  $\tau$  axis.

This is  $\tau$  equal to zero, so this is  $\frac{1}{2a} e^{-a|\tau|}$ . So this is a decaying exponential on both sides decaying exponential on positive and also the negative  $\tau$  axis, okay. Okay, 2 sided exponential which is decaying on both the positive  $\tau$  axis and also the negative  $\tau$  axis. So this is the auto correlation functions of  $e^{-a(t)} u(t)$ , okay. This is the auto correlation function.

Now let us find the energy spectral density, alright. So to find the energy spectral density, let us first start by finding the Fourier transform, okay.

(Refer Slide Time: 10:39)

$$\begin{aligned} X(F) &= \int_{-\infty}^{\infty} x(t) e^{-j2\pi Ft} dt \\ &= \int_0^{\infty} e^{-at} e^{-j2\pi Ft} dt \\ &= \int_0^{\infty} e^{-(a+j2\pi F)t} dt \end{aligned}$$

So to find the energy spectral density, let us now find the energy spectral density, so we start by finding start by deriving the Fourier transform. We have  $x(t)$  equals  $e^{-a(t)} u(t)$ . The Fourier transform  $X(F)$  equals integral - infinity to infinity  $x(t) e^{-j2\pi Ft} dt$  which is equal to integral - infinity to infinity.

Well,  $e^{-a(t)} u(t)$  is nonzero only for  $t$  greater than equal to zero. So this is  $e^{-a(t)} u(t) e^{-j 2 \pi f t} dt$  which is integral zero to infinity  $e^{-a(t)} e^{-j 2 \pi f t} dt$ , correct?

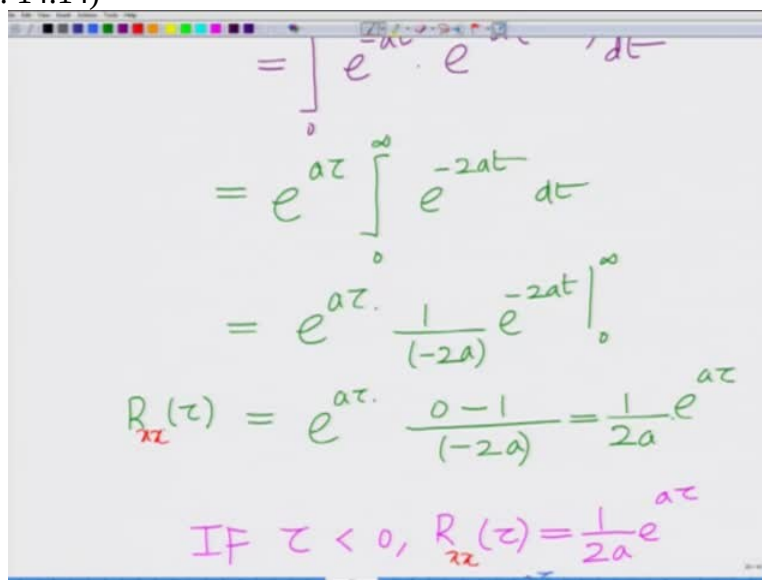

(Refer Slide Time: 12:48)

13:28

14:09

Now therefore this integral can be evaluated as  $e^{-a(t)} e^{-j 2 \pi f t}$  divided by  $-a - j 2 \pi f$  substitute the limits zero to infinity equals zero minus one divided by  $-a - j 2 \pi f$  equals  $1$  over  $a + j 2 \pi f$  and therefore what we have is the Fourier transform  $X(f)$  is  $1$  over  $a + j 2 \pi f$  and remember this is the Fourier transform, this is your Fourier transform of the signal is, this is the Fourier transform of the signal  $x(t)$ . And now energy spectral density is given by the magnitude square of the Fourier transform.

(Refer Slide Time: 14:14)

The image shows a handwritten derivation of the Fourier transform of an exponential signal. The steps are as follows:

$$\begin{aligned}
 &= \int_0^{\infty} e^{-at} \cdot e^{-j 2 \pi f t} dt \\
 &= e^{a\tau} \int_0^{\infty} e^{-2at} dt \\
 &= e^{a\tau} \cdot \frac{1}{(-2a)} e^{-2at} \Big|_0^{\infty} \\
 R_{xx}(\tau) &= e^{a\tau} \cdot \frac{0 - 1}{(-2a)} = \frac{1}{2a} e^{a\tau} \\
 \text{If } \tau < 0, R_{xx}(\tau) &= \frac{1}{2a} e^{a\tau}
 \end{aligned}$$

So the ESD that is  $S_{11}$  of  $F$  or  $S$  of  $s \times x$  of  $F$  equals magnitude  $x \times X(F)$  square, alright. Here also I can denote all this auto correlation functions by  $R_{xx}$  of  $\tau$ , this is  $R_{xx}$  of  $\tau$  rather than  $R_{11}$  of  $\tau$ , these can be denoted by  $R_{xx}$  of  $\tau$  and so on and these things can be corrected at all the other places that is we have here for instance  $R_{xx}$  of  $\tau$ , okay.

(Refer Slide Time: 15:23)

$x(t) \leftrightarrow X(F) = \frac{1}{a + j2\pi F}$

Fourier Transform of  $x(t)$ .

$S_{xx}(F) = |X(F)|^2 = \left| \frac{1}{a + j2\pi F} \right|^2$

$R_{xx}(\tau) \leftrightarrow S_{xx}(F) = \frac{1}{a^2 + 4\pi^2 F^2}$

of  $x(t)$ .

$$S_{xx}(F) = |X(F)|^2 = \left| \frac{1}{a + j2\pi F} \right|^2$$

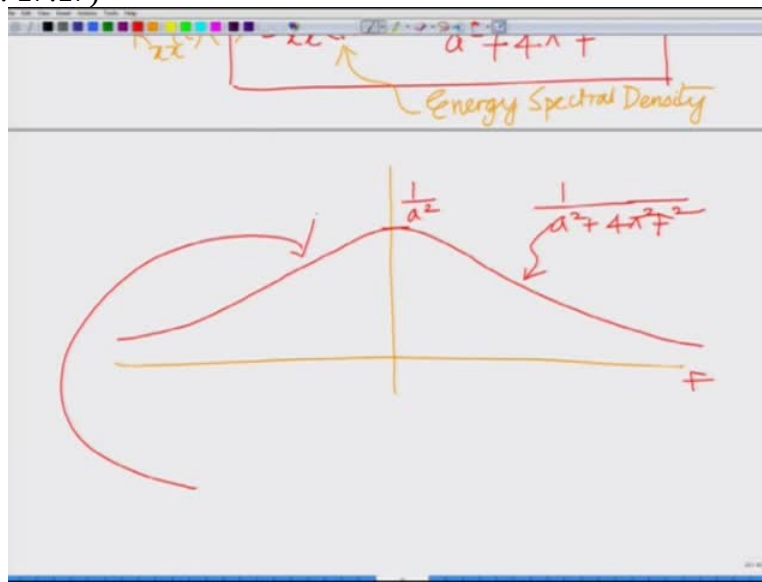

$$R_{xx}(\tau) \leftrightarrow S_{xx}(F) = \frac{1}{a^2 + 4\pi^2 F^2}$$

Energy Spectral Density

And therefore now the Fourier transform  $S_{xx}$  of  $F$  that is magnitude  $X(F)$  square that is magnitude 1 over  $a$  plus that is magnitude 1 over  $a$  plus  $j 2 \pi F$  that is 1 over  $a$  square plus  $4 \pi$  square  $S_{xx}$  of  $F$ , this is magnitude  $X(F)$  square and remember this is also one can also, now remember that this is also the Fourier transform of the auto correlation that is  $R_{xx}(\tau)$ , that is what we have over here that is if you remember that  $S_{xx}$  of  $F$  that is energy spectral density is also the Fourier transform of the auto correlation function  $R_{xx}(\tau)$  which is magnitude  $X(F)$  square.

Therefore  $R_{xx}(\tau)$  the Fourier transform is 1 over, so  $R_{xx}(\tau)$  Fourier transform of  $R_{xx}(\tau)$  is  $S_{xx}$  of  $F$  which is 1 over  $a$  square plus  $4 \pi$  square  $F$  square, this is also your energy spectral density. This is also the energy. Now we have already seen that this energy spectral density characterizes the distribution of energy in the frequency. So there is a spread of energy in the frequency domain.

(Refer Slide Time: 17:17)

So if you plot this thing  $S_{xx}$  of  $f$  at  $f$  equal to zero, this is  $1$  over  $a$  square and it looks it decays as  $f$  increases towards infinity it decreases, so this is at zero it is  $1$  over  $a$  square and this is  $1$  over  $a$  square plus  $4\pi$  square  $f$  square and this characterizes this gives the spread of the energy in the frequency domain. Spread of the energy of the signal in the spread of the energy of the signal in the frequency domain.

For instance one can ask the question, what is the energy of the signal between in the band  $-W$ ? Remember we can ask the question what is the, what energy how much energy is contained in

the band that is one can ask this questions how much energy, we would be interested in knowing, how much energy of this signal, right? Is considered in the band  $-W$  to  $-W$  to  $W$ , alright. And that can be derived by integrating this energy spectral density in this frequency band.

(Refer Slide Time: 19:08)

Energy contained in the band  $[-W, W]$

$$= \int_{-W}^W S_{xx}(F) dF$$

Energy in  $[-W, W]$

$$= \int_{-W}^W \frac{dF}{a^2 + 4\pi^2 F^2}$$

$$= \frac{1}{a^2} \int_{-W}^W \frac{dF}{1 + \frac{F^2}{\frac{a^2}{4\pi^2}}}$$

Substitute  $\tilde{F} = \frac{F}{a/2\pi}$

$$= 2\pi F/a$$

$$\Rightarrow d\tilde{F} = 2\pi \frac{F}{a}$$

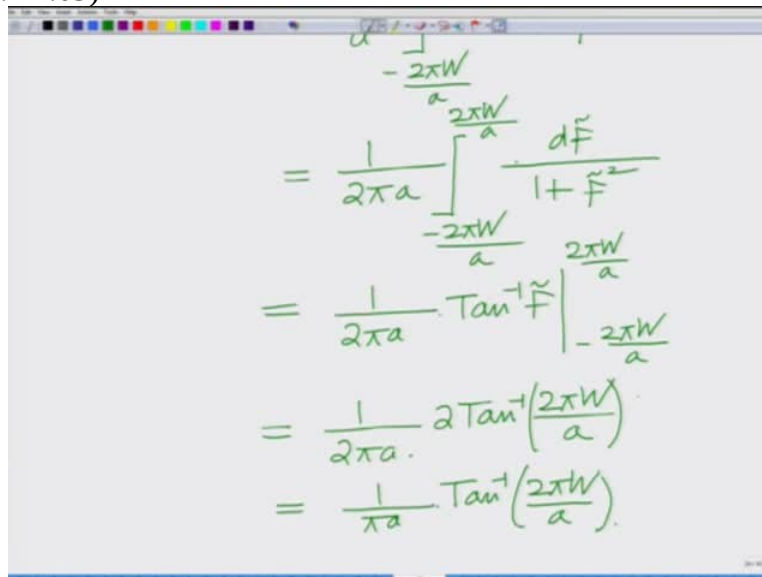

$$= \frac{1}{a^2} \int_{-\frac{2\pi W}{a}}^{\frac{2\pi W}{a}} \frac{\frac{a}{2\pi} d\tilde{F}}{1 + \tilde{F}^2}$$

So if I ask the question, what is the energy contained in the band  $-W$  to  $W$ ? That is equal to the integral  $-W$  to  $W$  of the energy spectral density  $S_{xx}$  of  $F$  into  $dF$  we can evaluate this, in fact so the energy in the band  $-W$  to  $W$  this is equal to  $-W$  to  $W$  integral of the energy spectral density that is  $dF$  by  $1$  over  $a$  square plus  $4\pi$  square  $F$  square. Now I am going to do some

manipulations, I am going to bring the a square outside, so this can be written as 1 over a square  
 - W to W d F by 1 plus F square divided by a square divided by 4 pi square, okay.

I have brought the 4 pi square into the denominator, now let us set or use the substitution  
 substitute till F tilde equals F divided by a over 2 pi, correct? Which implies or F is equal to F  
 tilde equals F over a over 2 pi which is basically 2 pi F divided by a which implies d F tilde  
 equals 2 pi d F by a and therefore this integral here can now be modified with this substitution as  
 1 over a square the limits become - 2 pi W over a to 2 pi W over a times d F tilde into 2 pi over a  
 or d F tilde equals d F equals d F tilde by 2 pi over a. So this is into a over 2 pi by 1 plus F square  
 divided by a square by 4 pi square is nothing but F tilde square.

(Refer Slide Time: 22:09)

$$\begin{aligned}
 &= \frac{1}{2\pi a} \int_{-\frac{2\pi W}{a}}^{\frac{2\pi W}{a}} \frac{d\tilde{F}}{1+\tilde{F}^2} \\
 &= \frac{1}{2\pi a} \cdot \tan^{-1}\tilde{F} \Big|_{-\frac{2\pi W}{a}}^{\frac{2\pi W}{a}} \\
 &= \frac{1}{2\pi a} \cdot 2 \tan^{-1}\left(\frac{2\pi W}{a}\right) \\
 &= \frac{1}{\pi a} \cdot \tan^{-1}\left(\frac{2\pi W}{a}\right)
 \end{aligned}$$

The image shows a handwritten derivation on a digital whiteboard. The text is as follows:

$$= \frac{1}{2\pi a} \cdot \text{Tan}^{-1} \tilde{F} \Big|_{-\frac{2\pi W}{a}}^{\frac{2\pi W}{a}}$$

Energy of  $e^{-at} u(t)$  in Band  $[-W, W]$  =  $\frac{1}{2\pi a} \cdot 2 \text{Tan}^{-1} \left( \frac{2\pi W}{a} \right)$

Energy contained in Band  $[-W, W]$  =  $\frac{1}{\pi a} \cdot \text{Tan}^{-1} \left( \frac{2\pi W}{a} \right)$

And therefore what I have over here is the energy contained in the band - W to W is  $\frac{1}{2\pi a}$  -  $2\pi W$  by  $a$  to  $2\pi W$  by  $a$  d  $\tilde{F}$  tilde divided by  $\frac{1}{\tilde{F}^2}$  and this you can see is  $\frac{1}{2\pi a}$   $\text{Tan}^{-1} \tilde{F}$  tilde between the limits  $2\pi W$  by  $a$  -  $2\pi W$  by  $a$ . So this is simply  $\frac{1}{2\pi a}$  into  $2 \text{Tan}^{-1} 2\pi W$  over  $a$  which is basically  $\frac{1}{\pi a}$   $\text{Tan}^{-1} 2\pi W$  over  $a$ .

And this is a very interesting result, what is this? This is the energy contained in the band, this is the very this is the energy contained, energy of what? Energy of  $x(t)$  that is  $e$  that is the signal  $e$  to the power of  $-a(t) u(t)$  contained in the band - W. So what we are now able to achieve is being we are able to we are able to compute not only what is the total energy of the signal, of course that is what we have done before, right?

Much before when we defined the energy of the signal but we are also able to compute what is the precise amount of energy of, what is the precise amount of energy of a particular signal which is concentrated in a certain band of interest that is - W to W? And that we are able to achieve because we are able to compute the energy spectral density of this signal and from the energy spectral density we integrated over the frequency band of interest to derive the energy of the signal contained in that band of interest - W to W.

So, alright so this is the energy again of your signal  $e^{-at} u(t)$  to the power of  $-a(t) u(t)$  in band. Naturally now if I set  $W$  equal to infinity that is from  $-\infty$  to  $\infty$  I should get the total energy of the signal.

(Refer Slide Time: 25:07)

Energy contained in Band  $[-W, W]$

Set  $W = \infty$

$$\frac{1}{\pi a} \cdot \tan^{-1}\left(\frac{2\pi W}{a}\right) \Big|_{W=\infty}$$

$$= \frac{1}{\pi a} \cdot \frac{\pi}{2} = \boxed{\frac{1}{2a}}$$

Total Energy of Signal

$$= \frac{1}{\pi a} \cdot \frac{\pi}{2} = \boxed{\frac{1}{2a}}$$

Total Energy of Signal

$x(t) = e^{-at} u(t)$

Energy =  $\int_{-\infty}^{\infty} |x(t)|^2 dt$

$$= \int_0^{\infty} e^{-2at} dt$$

$$= \frac{1}{-2a} \cdot e^{-2at} \Big|_0^{\infty}$$

$$\begin{aligned}
 &= \int_0^{\infty} e^{-2at} dt \\
 &= \left. \frac{1}{-2a} e^{-2at} \right|_0^{\infty} \\
 &= \frac{0 - 1}{-2a} = \frac{1}{2a} \\
 &= \int_{-\infty}^{\infty} S_{xx}(F) dF
 \end{aligned}$$

Now set, let this is an interesting exercise set  $W$  equals infinity by  $\pi a \tan^{-1} \frac{W}{a}$  by  $a$  for  $W$  equal to infinity this becomes  $1$  over  $\pi a \tan^{-1} \infty$  is  $\pi$  over  $2$  so the  $\pi$ s go away and this will become  $1$  over  $2a$ . And this should be the total energy and this should give us technically this should give us the total energy of the, technically this should give us the total energy of the signal that is contained over the entire. This should technically be total energy of the, signal  $1$  over  $2a$ .

Is it the total energy of the signal? Let us check. Our signal is  $x(t)$  equals  $e^{-at} u(t)$ . It is energy is integral  $-\infty$  to  $\infty$   $x(t)^2 dt$  that is magnitude  $x(t)^2 dt$ . This is from our definition of energy, now remember this is this function is nonzero only for  $t$  greater than equal to zero. So this is zero to  $\infty$   $e^{-2at} dt$  which is  $1$  over  $-2a$   $e^{-2at}$  evaluated between the limits zero to infinity and therefore this is zero minus  $1$  divided by  $-2a$  which is  $1$  over  $2a$  and this is indeed if you can look above this is indeed if you can go above this is indeed the total energy of the signal.

This is indeed the total energy of the signal, this is also equal to what we have shown is basically this is also this quantity is indeed the total energy and this is also integral  $-\infty$  to  $\infty$   $S_{xx}(F) dF$ . By setting  $W$  equal to infinity that is the band of interest to be from  $-\infty$  to  $\infty$  we are integrating the energy spectral density over the entire frequency axis that is the area under the entire energy hat is the area under the energy spectral density over the entire frequency domain that is from  $-\infty$  to  $\infty$  that yields the total energy of the signal. And

not only that something even more interesting let us look at our auto correlation function  $R_{xx}$  at  $\tau = 0$ .

(Refer Slide Time: 28:28)

The image shows two slides of handwritten mathematical derivations. The top slide shows the derivation of  $R_{xx}(0)$  from the general auto-correlation function  $R_{xx}(\tau)$ . The bottom slide shows the same derivation for a specific signal  $x(t) = e^{-at} u(t)$ .

**Top Slide:**

$$R_{xx}(\tau) \xleftarrow{\text{set } \tau = 0} \int_{-\infty}^{\infty} x(t) x^*(t - \tau) dt$$

$$= \int_{-\infty}^{\infty} x(t) x^*(t) dt \quad \text{set } \tau = 0$$

$$R_{xx}(0) = \int_{-\infty}^{\infty} |x(t)|^2 dt$$

Energy of Signal.

**Bottom Slide:**

$$= \int_{-\infty}^{\infty} x(t) x^*(t) dt$$

$$R_{xx}(0) = \int_{-\infty}^{\infty} |x(t)|^2 dt$$

Energy of Signal.

$x(t) = e^{-at} u(t), \quad -a < t < \infty$

$$R_{xx}(\tau) = \frac{1}{2a} e^{-a|\tau|}$$

set  $\tau = 0$ ,

$$R_{xx}(0) = \frac{1}{2a}$$

The image shows a handwritten derivation on a digital whiteboard. At the top right, the total energy of the signal is given as  $\int_{-\infty}^{\infty} |x(t)|^2 dt$ . Below this, the auto-correlation function is defined as  $R_{xx}(\tau) = \int_{-\infty}^{\infty} x(t) x^*(t-\tau) dt$ . An arrow points from this definition to the case where  $\tau = 0$ , resulting in  $R_{xx}(0) = \int_{-\infty}^{\infty} x(t) x^*(t) dt$ . This is further simplified to  $R_{xx}(0) = \int_{-\infty}^{\infty} |x(t)|^2 dt$ . A pink arrow points from this final expression to the total energy equation at the top right, with the text "Energy of Signal" written in pink.

Now set  $\tau$  equal to zero. Remember auto correlation function is - infinity to infinity  $x(t)$  into  $x$  conjugate  $t - \tau$   $dt$ . Now set  $\tau$  equal to zero in this and this becomes integral - infinity to infinity  $x(t)$  once you set  $\tau$  equal to zero its conjugate of  $t$   $dt$  which is basically equal to magnitude  $x(t)$  square  $dt$ .

So  $R_{xx}(0)$  that is if you set  $\tau$  equal to zero  $R_{xx}(0)$  equals again  $R_{xx}(0)$  again gives us the energy of the signal, it again gives us the energy of the. Now for our signal  $x(t)$  equal to  $e^{-at} u(t)$ . We have shown that  $R_{xx}(\tau)$  equals  $\frac{1}{2a} e^{-a|\tau|}$ . Now set  $\tau$  equal to zero and  $R_{xx}(0)$ , you can now once again see equals  $\frac{1}{2a} e^{-a \cdot 0}$ ,  $e$  to the power of  $-a \cdot 0$ ,  $e$  to the power of zero which is again simply  $\frac{1}{2a}$ .

And now you can once again see this is also equal to that is if you go again this quantity is again you can see this quantity is once again equal to the total energy this quantity is once again equal to the total energy of the signal that is  $\frac{1}{2a}$ . So again  $R_{xx}(\tau)$  the auto correlation function the auto correlation function of the signal  $x(t)$  evaluated at  $\tau$  equal to zero gives us the total energy of the signal that is  $\frac{1}{2a}$ .

Therefore all these things are equivalent and that is what we have shown, if you go back and look at that theory you will see that all these things are equivalent and yield the total energy of the signal.

(Refer Slide Time: 31:23)

Handwritten mathematical derivation on a whiteboard:

$$x(t) = e^{-at} u(t), \quad -a|t|.$$

$$R_{xx}(\tau) = \frac{1}{2a} e^{-a|\tau|}$$

Set  $\tau = 0$ ,

$$R_{xx}(0) = \frac{1}{2a}$$

$$R_{xx}(0) = \int_{-\infty}^{\infty} |x(t)|^2 dt = \int_{-\infty}^{\infty} S_{xx}(F) dF$$

Parseval's Relation  
Parseval's Theorem

$$= \int_{-\infty}^{\infty} |X(F)|^2 dF$$

That is your  $R_{xx}$  auto correlation function evaluated at zero equals - infinity to infinity magnitude  $x(t)$  square  $dt$  which is - infinity to infinity total area under the energy spectral density which is equal to - infinity to infinity magnitude  $X(F)$  square  $dF$  from the Parseval's, remember this part that is this is what is traditionally known as your Parseval's relation or Parseval's theorem for that matter. This is also known as Parseval's that is integral - infinity to infinity magnitude  $x(t)$  square  $dt$  equals integral - infinity to infinity magnitude  $X(F)$  square  $dF$ , alright.

So this completes our example of the auto correlation function and energy spectral density where we have shown and explored several interesting things, we have considered a signal, derived its auto correlation function derived the corresponding energy spectral density, alright, realized that this is the distribution of the energy of the signal in the frequency domain, derived the portion of energy of the signal contained in the band of interest that is -  $W$  to  $W$ , demonstrated that if  $W$  is set to infinity than it gives the total energy of the signal which in this case is  $1$  over  $2a$ .

That is also equal to the energy of the that is integral - infinity to infinity magnitude  $x(t)$  square  $dt$ , it is also equal to  $R_{xx}$  at  $\tau = 0$  that is  $R_{xx}(0)$  the auto correlation function of the signal evaluated at  $\tau = 0$ , alright. So this comprehensively completes the signal analysis and the spectral analysis that is the discrete Fourier series and the Fourier transform and the various properties of the Fourier transform of the signal, thank you.
