Lecture - 44

Fourier Analysis Examples - Complex Exponential Fourier Series and Trigonometric Fourier Series of Periodic Triangular Wave, Periodic Convolution

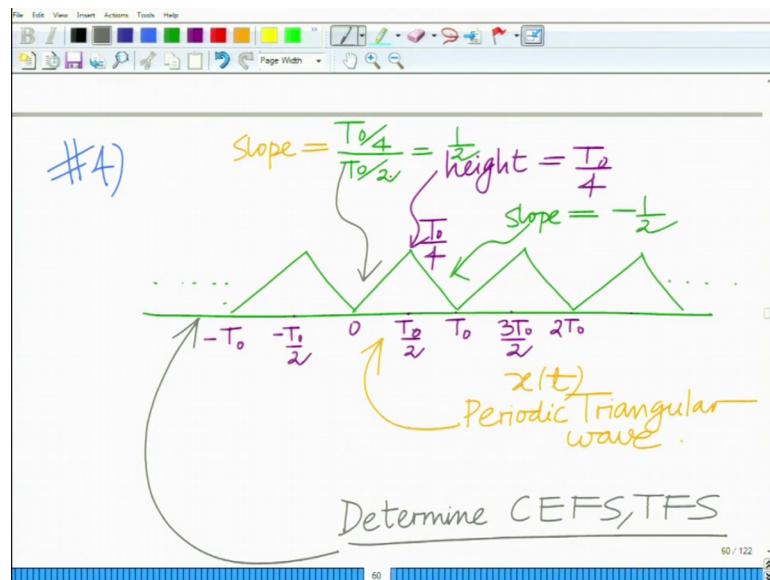

Hello, welcome to another module in this massive of online course. So, we are looking at example problems in Fourier analysis let us continue this discussion alright.

(Refer Slide Time: 00:25)

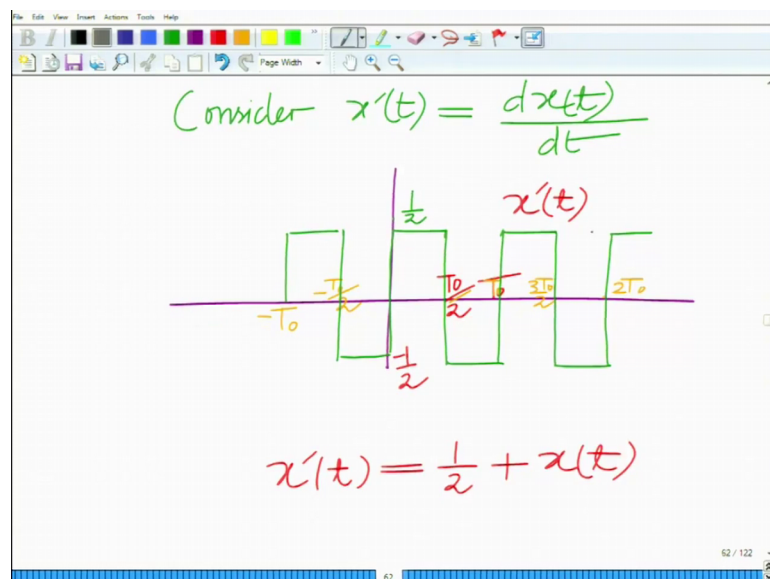

So, we are looking at example problems in Fourier analysis and we have seen previously, I mean we have currently looking at the Fourier series expansion of this.

(Refer Slide Time: 01:02)

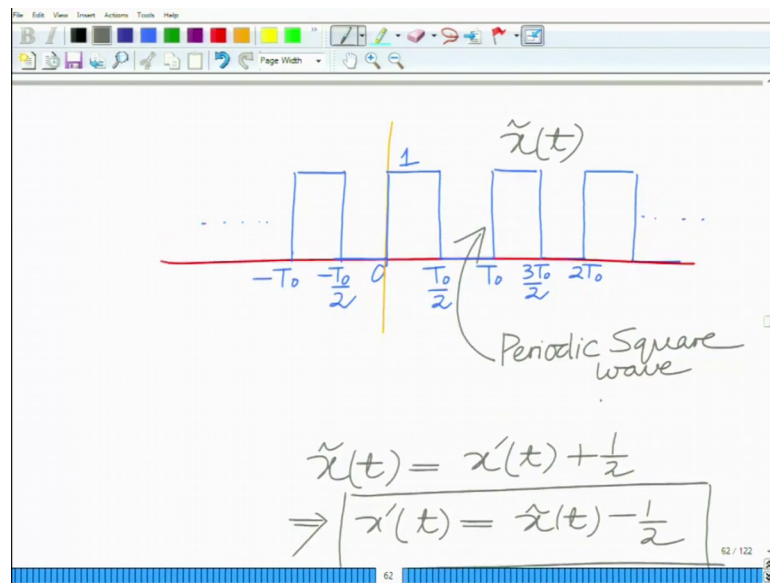

Periodic triangular wave and we have seen this triangular wave.

(Refer Slide Time: 01:06)

If we look at the derivative $x'(t)$ and consider $\tilde{x}(t)$, which is half plus $x'(t)$ follow I am sorry $x'(t)$, is we have $x'(t)$ $x'(t)$ and if we consider $\tilde{x}(t)$ which is half plus I am sorry I need to $\tilde{x}(t)$ which is half plus $x'(t)$, that is given by this periodic square wave that we have seen earlier ok.

(Refer Slide Time: 01:37)

So, we have $\tilde{x}(t)$ is $x'(t)$ plus half and therefore, $x'(t)$ that is derivative of $x(t)$ is $\tilde{x}(t)$ minus half.

(Refer Slide Time: 01:50)

The figure shows handwritten equations on a whiteboard. A green horizontal line is drawn at the top. The equations are:

$$\text{CEFS of } \tilde{x}(t) = \frac{1}{2} + \frac{1}{j\pi} \sum_{m=-\infty}^{\infty} \frac{e^{j(2m+1)\omega_0 t}}{(2m+1)}$$

$$\text{CEFS of } x'(t) = \tilde{x}(t) - \frac{1}{2} = \frac{1}{j\pi} \sum_{m=-\infty}^{\infty} \frac{e^{j(2m+1)\omega_0 t}}{(2m+1)}$$

And we know the CEFS of the $\tilde{x}(t)$ we have already defined or we already derived the complex exponential Fourier series of $\tilde{x}(t)$ and the complex exponential Fourier series of $x'(t)$, this is given as half plus 1 over $j\pi$ summation m equals minus infinity to infinity 1 over twice m plus 1. In fact, times e raise to $j(2m+1)\omega_0 t$.

This is the complex exponential Fourier series of $x(t)$ therefore, this implies the CEFS the complex exponential Fourier series of $x'(t)$ which is equal to $x(t)$ minus half, that is equal to now subtracting half you can readily seen that is 1 over $j\pi$ simply m equals minus infinity m equals m equals minus infinity to infinity e raise to $j2\pi m$ plus 1 omega naught t by $2\pi m$ plus 1 .

And now what we have is now. So, we have derived the c . So, we have been able to derived the CEFS the complex exponential Fourier series of $x'(t)$. Now also we realize that $x'(t)$ is nothing, but the derivative of $x(t)$ ok.

And we have already seen this that is if we have the complex exponential Fourier series of $x(t)$ or let us look at this.

(Refer Slide Time: 04:07)

Let CEFS of $x(t)$
 $= \sum_{k=-\infty}^{\infty} C_k \cdot e^{jk\omega_0 t}$
 \Rightarrow CEFS of $x'(t)$
 $= \frac{d x(t)}{dt}$
 $= .$

Let us say the complex exponential Fourier series of $x(t)$ which is the triangular wave Let the CEFS of $x(t)$ which is the original triangular wave $x(t)$ equal to let us denote this by summation k equals minus infinity $C_k e$ raise to $j k \omega_0 t$.

Now, this implies the complex exponential Fourier series of $x'(t)$ which is equal to d that is the derivative of $x(t)$.

(Refer Slide Time: 05:02)

The image shows a whiteboard with handwritten mathematical derivations. At the top, there is a menu bar with options like 'File', 'Edit', 'View', 'Insert', 'Actions', 'Tools', and 'Help'. Below the menu bar is a toolbar with various drawing tools. The main content of the whiteboard is as follows:

$$\begin{aligned} & \Rightarrow \text{CEFS of } x(t) \\ & = \frac{dx(t)}{dt} \\ & = \sum_{k=-\infty}^{\infty} \frac{j k \omega_0 C_k \cdot e^{j k \omega_0 t}}{x_k} \end{aligned}$$

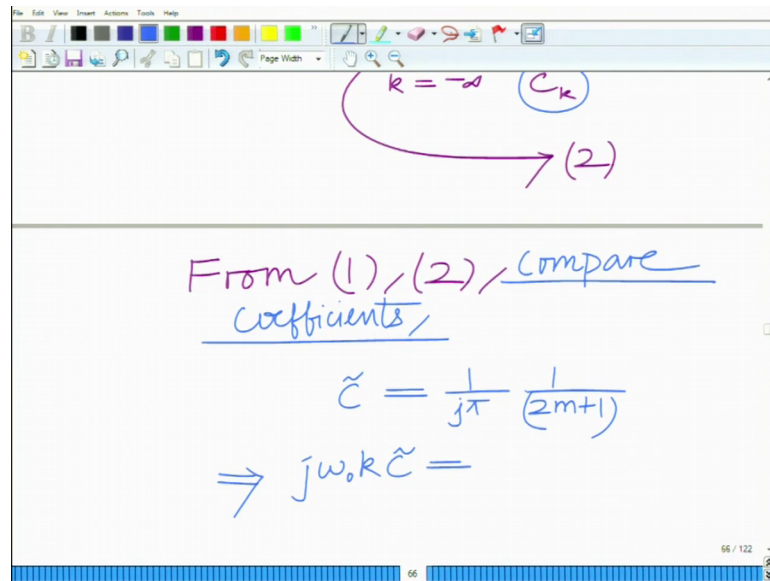

An arrow points from the summation term to the label (2) at the bottom right of the derivation.

That will be given as now differentiate this, you have summation k equals minus infinity to infinity, if we differentiate this you have $j k \omega_0$ correct you have $j k \omega_0 C_k e^{j k \omega_0 t}$.

And this is basically your C_k you can call this coefficients of the complex Fourier series have C_k . Now, let us call this as expression number 2 and we already have a expression for this complex exponential Fourier series of $x(t)$ from above let us call this as expression 1.

Now, from expression 2 and expression 1 comparing the coefficients now.

(Refer Slide Time: 05:56)

Because both of them are complex exponential Fourier series of x prime t or the derivative of x t , from 1 and 2 what we can do is? We can compare the coefficients, because both are the complex correct what we are doing is we are comparing the Fourier [coe/coefficients] coefficients of the complex [exp/exponential] exponential Fourier series.

Because the CEFS because the complex [exp/exponential] exponential Fourier series representation, because both give us the CEFS of x prime t . So, what we can conclude is that the coefficients must be equal in particular the coefficients of the terms e raise to $j k$ e raise to $j k$ $\omega_0 t$. So, what we have is comparing the coefficients we have that this coefficients C tilde k must be equal to this coefficient of e raise to $j 2 \pi$ e raise to $j 2 m$ plus 1 $\omega_0 t$.

Or in other words we must have C tilde k equals coefficient of e raise to $j k$ $\omega_0 t$ which is basically if we look at that coefficient that is nothing, but 1 over $j \pi$ times 1 over $2 m$ plus 1, but remember as you can see from all C tilde recall C tilde is nothing, but $J \omega_0 k C$ tilde ok . Now, therefore, now off course this remember this C tilde this is C tilde k .

(Refer Slide Time: 07:48)

From (1) / (2) / Comparison
Coefficients / $k = \text{odd} = 2m+1$

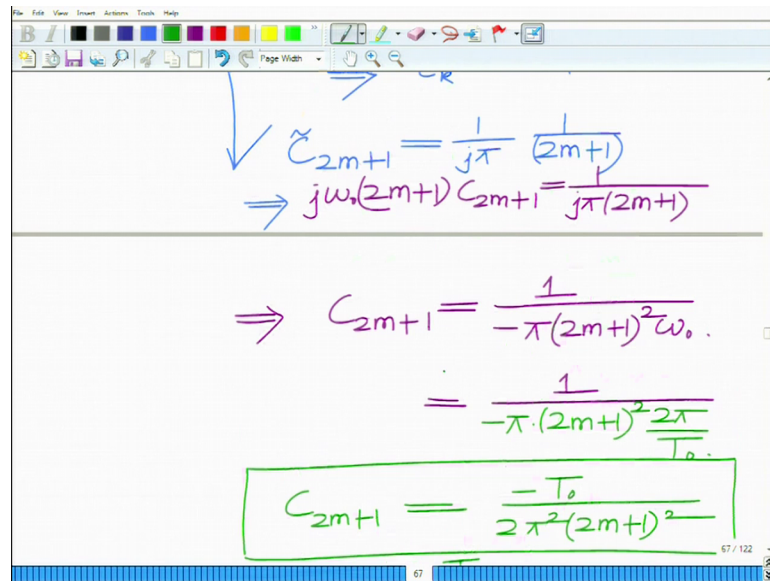

$$\tilde{C}_k = \frac{1}{j\pi (2m+1)}$$

If $k = \text{even}$
 $\tilde{C}_k = 0$
 $\Rightarrow j\omega^k C_k = 0$
 $\Rightarrow C_k = 0 \text{ if } k \neq 0$

This is only for k is even or k equal to $2m + 1$ this only for k equals odd sorry this is only for k equal to odd that is $2m + 1$.

If k is even you can see \tilde{C}_k because this exists only defined that is CEFS you can see of x prime t contains only the coefficients corresponding to odd k that is the k of the form $2m + 1$. So, we will have \tilde{C}_k equals if k is even we have \tilde{C}_k equals 0 implies $j\omega^k C_k = 0$ implies $C_k = 0$ if $k \neq 0$ ok, this is the story for $k \neq 0$ k is $\neq 0$ then this implies that it has to be the case that C_k is equal to 0.

(Refer Slide Time: 08:52)

$$\checkmark \tilde{C}_{2m+1} = \frac{1}{j\pi(2m+1)}$$

$$\Rightarrow j\omega_0(2m+1)C_{2m+1} = \frac{1}{j\pi(2m+1)}$$

$$\Rightarrow C_{2m+1} = \frac{1}{-\pi(2m+1)^2\omega_0}$$

$$= \frac{1}{-\pi(2m+1)^2 \frac{2\pi}{T_0}}$$

$$C_{2m+1} = \frac{-T_0}{2\pi^2(2m+1)^2}$$

On the other hand for C_k for k is even then we have C_k of $2m+1$ equals 1 over $j\pi(2m+1)$, which implies that you have $j\omega_0(2m+1)C_k$ which is $2m+1$ over $j\pi$ or C_k of $2m+1$ equals 1 over $j\pi(2m+1)$.

Which implies C_k of $2m+1$ where k is odd k equals to 1 is 1 over this is 1 over minus π into $2m+1$ square, $2m+1$ square into ω_0 and this can further be simplified as 1 over minus $\pi(2m+1)^2\omega_0$ remember is 2π by T_0 , which implies that C_k of $2m+1$ equals $-\frac{T_0}{2\pi^2(2m+1)^2}$. So, this is the result that we have relating to the regarding the coefficients C_{2m+1} and C_k is 0 by the way if k is odd.

So we have the coefficients C_k we have derived the expression for the coefficient C_k . So, the coefficient C_k in the complex exponential Fourier series of the original periodic triangular wave and C_k is 0 if k is odd and if k is even that is in case of the form $2m+1$ then we have derived this expression for C_k of $2m+1$.

The only coefficient that is remain in our s C_0 because remember we cannot derive C_0 using this technique, because C_0 when we differentiate $x(t)$ remember the dC_0 component C_0 is constant that vanishes. So, that you can derive that using the from the derivative that is exponent.

So, what we do for that is we simply evaluate the DC coefficient remember the DC coefficients C_0 equals $\frac{1}{T_0} \int_0^{T_0} x(t) dt$.

(Refer Slide Time: 11:28)

$$C_0 = \frac{1}{T_0} \int_0^{T_0} x(t) dt$$

$$= \frac{1}{T_0} \cdot \frac{1}{2} \times T_0 \times \frac{T_0}{4}$$

$$= \frac{T_0}{8}$$

Which is $\frac{1}{T_0}$ the area under $x(t)$, which you can see this is the triangular wave in an interval of duration T_0 the triangular wave the area is half base into height that is half into T_0 into T_0 by 4. So, this is simply going to be $\frac{1}{T_0}$ into the area half into T_0 into T_0 by 4 which you can basically see is $\frac{T_0}{8}$ ok. So, this C_0 equals.

(Refer Slide Time: 12:26)

$$C_0 = \frac{T_0}{8}$$

$$\text{CEFS of } x(t) = \frac{T_0}{8} - \frac{T_0}{(2\pi)^2} \sum_{m=-\infty}^{\infty} \frac{e^{j(km+1)\omega_0 t}}{(2m+1)^2}$$

CEFS of Periodic Triangular wave.

T_0 over 8 and therefore, the CEFS of $x(t)$ the CEFS of original triangular wave that is $x(t)$ is T_0 by 8 minus T_0 by 2π whole square summation m equals minus infinity to infinity $e^{j 2 m \pi t}$ by $2 m \pi$ square. So, this is the CEFS of the original triangle wave periodic triangular wave, this is the complex exponential Fourier series of the periodic triangular wave all right.

And now again similarly 1 can readily evaluate the TFS that is the trigonometric Fourier series and the TFS is given as.

(Refer Slide Time: 14:00)

CEFS of Periodic Triangular wave.

TFS: $\frac{a_0}{2} = C_0 = \frac{T_0}{8}$
 $\Rightarrow a_0 = \frac{T_0}{4}$

$a_k = C_k + C_{-k}$

Now, coming to the TFS remember we have a_0 by 2 equals C_0 equals T_0 by 8, which implies a_0 equals T_0 by 4. Now a_k for k naught equal to 0 equals C_k plus C of minus k naught off course if C_k is odd.

(Refer Slide Time: 14:30)

Handwritten notes on a whiteboard:

$$a_k = c_k + c_{-k}$$

$k = \text{odd} \Rightarrow c_k, c_{-k} = 0$
 $\Rightarrow a_k = 0$

\checkmark If $k = \text{even}$,
 $a_k =$

69 / 122

$c_k + c_{-k} = 0$ this implies $a_k = 0$. Now if k is even now if k is even what will happen is we have $a_k = 0$ well we have $a_k = 0$ or I am sorry if k is even k is even.

(Refer Slide Time: 15:10)

Handwritten notes on a whiteboard:

$$a_k = c_k + c_{-k}$$

$k = \text{even} \Rightarrow c_k, c_{-k} = 0$
 $\Rightarrow a_k = 0$

\checkmark If $k = \text{odd}$.
 $k = 2m + 1$

$$a_{2m+1} = \frac{-T_0}{2\pi^2(2m+1)^2} + \frac{-T_0}{2\pi^2(-2m-1)^2}$$

69 / 122

$c_k + c_{-k} = 0$ if k is odd we have $a_k = 0$ that is k equal to is of the form $2m + 1$, then a_k or $a_{2m+1} = 0$ well this is $\frac{-T_0}{2\pi^2(2m+1)^2} + \frac{-T_0}{2\pi^2(-2m-1)^2}$ which you can see is basically.

(Refer Slide Time: 16:00)

$$= \frac{-2 \cdot T_0}{2\pi^2(2m+1)^2}$$
$$a_{2m+1} = \frac{-T_0}{\pi^2(2m+1)^2}$$
$$b_k = J(C_k - C_k) = 0 \text{ if } k = \text{even}$$

Minus twice T_0 by $2\pi^2$ into $(2m+1)^2$ which is equal to minus T_0 by $\pi^2(2m+1)^2$. I am sorry minus T_0 by π^2 by $(2m+1)^2$ this is your a_{2m+1} ok.

So, this is your a_{2m+1} . And similarly now coming to b_k b_k equals $J(C_k - C_k)$ minus k equals 0 if k is even because k is even C_k and C_{k-1} are both zeroes so, b_k is 0. If k is odd then b_k is.

(Refer Slide Time: 17:10)

$$b_k = J(C_k - C_k) = 0 \text{ if } k = \text{even}$$
$$k = 2m+1.$$
$$= J\left(\frac{-T_0}{2\pi^2(2m+1)^2} - \frac{-T_0}{2\pi^2(2m-1)^2}\right)$$
$$b_{2m+1} = 0$$
$$\Rightarrow b_k = 0 \forall k$$

Then b_k is basically j times well minus T_0 by 2π square $2m+1$ whole square minus T_0 or minus see minus k minus minus T_0 by 2π square minus $2m$ minus 1 whole square which you can clearly is 0.

So, b of $2m+1$ 0 which implies b_k is 0 for k even or which means b_k is 0 for or k .

(Refer Slide Time: 18:05)

Handwritten mathematical derivation on a whiteboard:

$$b_{2m+1} = 0$$

$$\Rightarrow b_k = 0 \quad \forall k$$

TFS of $x(t)$

$$= \frac{T_0}{8} - \sum_{m=1}^{\infty} \frac{T_0^2 \cos((2m+1)\omega t)}{\pi^2 (2m+1)^2}$$

TFS of Periodic Triangular wave.

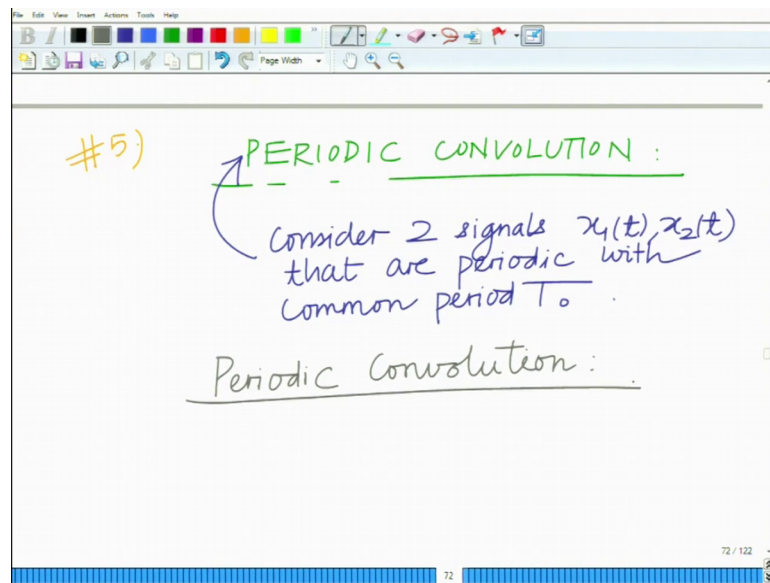

Therefore, the TFS of the periodic triangular wave $x(t) = \frac{T_0}{8} - \sum_{m=1}^{\infty} \frac{T_0^2 \cos((2m+1)\omega t)}{\pi^2 (2m+1)^2}$ equal to 1 to infinity T_0 square by π square into $2m+1$ square into cosine $2m+1$ ω t, that is your TFS this is a TFS of the periodic triangular wave this is your p a TFS of the periodic triangular wave ok.

So, that is basically completes is slightly elaborate the procedure to derive it is likely elaborate it is more simplistic and more intuitive than trying to rather the direct approach of deriving the CEFS the TFS that trying to employ, the triangular wave and trying to integrate the triangular wave by multiplying by the various complex exponentials or the various harmonics and the integrating to derive the various coefficients of the CEFS ok.

Slightly it is an interesting and very intuitive that is to consider the derivative of the triangular wave which is square wave and then approach the CEFS from that triangle.

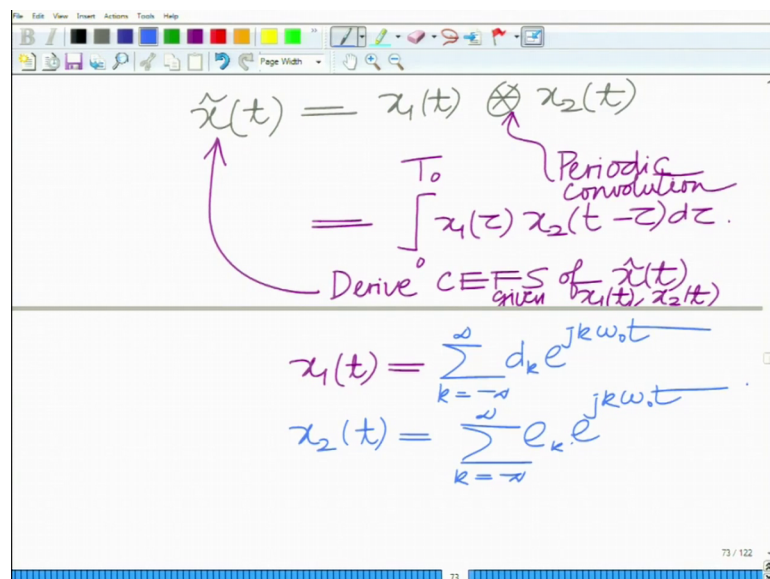

All right let us proceed to the next problem in the next problem is fairly simple, but yet it again another intuitive problem that is problem number 5.

(Refer Slide Time: 20:09)

And this problem is regarding periodic convolution. Now consider is periodic convolution, now consider 2 signals $x_1(t)$ and $x_2(t)$ which are periodic with common period T_0 , with the common period T_0 now the periodic convolution is defined as now the periodic convolution of these 2 signals with common period T_0 is $\tilde{x}(t)$ equals $x_1(t)$ convolved with $x_2(t)$ and this is symbol for this periodic convolution.

(Refer Slide Time: 21:35)

This is your periodic convolution and this is done over this is convolution basically over a period over any period that is $x_1(\tau) x_2(t - \tau)$.

So, while in the conventional convolution we are integrating from a tau from minus infinity to infinity remember this is for 2 periodic signals with the common period T_0 and integration is over only 1 period the integration is over only 1 period and now let us derive a property of this periodic convolution let now what we want to do is derive the CEFS derive CEFS of $\tilde{x}(t)$ given the CEFS of $x_1(t)$ and $x_2(t)$ that is, let us say $x_1(t)$ equals summation k equals minus infinity to infinity $d_k e^{jk\omega_0 t}$, $x_2(t)$ equals summation k equals minus infinity to infinity $e_k e^{jk\omega_0 t}$.

(Refer Slide Time: 23:44)

The image shows a handwritten derivation on a whiteboard background. At the top, there is a toolbar with various drawing tools. The main content is as follows:

$$\tilde{x}(t) = \int_0^{T_0} x_1(\tau) x_2(t-\tau) d\tau$$

$$= \int_0^{T_0} x_1(\tau) \sum_{k=-\infty}^{\infty} e_k e^{jk\omega_0(t-\tau)} d\tau$$

Below the second equation, a horizontal line is drawn, and the text "interchange sum/integral" is written in green cursive below the line.

At the bottom right of the slide, the text "73 / 122" is visible.

Then now remember $\tilde{x}(t)$ is simply the periodic convolution which is integrals over 1 period 0 to T_0 $x_1(t)$ or $x_1(\tau) x_2(t - \tau)$, which is integration over 1 period $x_1(\tau)$ now it is now $x_2(t - \tau)$ you substitute the CEFS.

So, that gives the summation k equals minus infinity to infinity $C_k e^{jk\omega_0 t - jk\omega_0 \tau}$. And, now you interchange the summation and the integration and that gives us and if you interchange, that is if you interchange sum and the Integral that gives the summation k equals minus infinity to infinity $e_k \int_0^{T_0}$.

(Refer Slide Time: 25:00)

The image shows a digital whiteboard with handwritten mathematical equations. The top equation is:

$$= \int_0^{T_0} x_1(\tau) \sum_{k=-\infty}^{\infty} e_k e^{jk\omega_0(t-\tau)} d\tau$$

Below this, a green line separates the equations. The text "interchange sum/integral" is written in green above the next equation. The second equation is:

$$= \sum_{k=-\infty}^{\infty} e_k e^{jk\omega_0 t} \int_0^{T_0} x_1(\tau) e^{-jk\omega_0 \tau} d\tau$$

Below this, the final equation for the coefficient d_k is written:

$$d_k = \frac{1}{T_0} \int_0^{T_0} x_1(\tau) e^{-jk\omega_0 \tau} d\tau$$

The whiteboard interface includes a toolbar at the top with various drawing tools and a page number "74 / 122" at the bottom right.

Ah well let us write it this way we can split the e raise to j k omega naught t. So, e raise to j k omega naught t it does not depend on tau comes out of the integral what is remaining is 0 to T 0 x 1 tau integral x 1 tau e raise to minus j omega naught tau d tau.

And we can now see this quantity which is nothing, but integral x 1 tau multiplied by e raise to minus j k omega naught tau d tau over 1 period tau not is nothing, but the complex exponential Fourier series of the co complex exponential that is the CEFS coefficient of x 1 tau that is the k th coefficient of the complex exponential Fourier series of x 1 tau which is nothing, but your d k.

So, at this. In fact, not d k, but this is. In fact, T 0 times d k because you can see d k equals 1 over T 0 tau naught T 0 integral 0 to T 0 x 1 tau e raise to minus j k omega naught tau d tau.

(Refer Slide Time: 26:35)

$$= \sum_{k=-N}^{\infty} e_k e^{jk\omega_0 t} \int_0^{T_0} x_1(z) e^{jk\omega_0 z} dz$$

$$d_k = \frac{1}{T_0} \int_0^{T_0} x_1(z) e^{jk\omega_0 z} dz$$

$$\tilde{x}(t) = \sum_{k=-\infty}^{\infty} T_0 d_k e_k e^{jk\omega_0 t}$$

$$\sum_{k=-\infty}^{\infty} \tilde{c}_k e^{jk\omega_0 t}$$

$$\tilde{c}_k = T_0 d_k e_k$$

So, this is in fact, your. So, this is. In fact, $T_0 d_k$. So, finally, you get this is summation k equals minus infinity to infinity $T_0 d_k e_k e^{jk\omega_0 t}$. This is the complex exponential Fourier series which implies that if we have the complex exponential Fourier series coefficients, if we have the complex exponential Fourier series of this as k equals minus infinity to infinity $\tilde{c}_k e^{jk\omega_0 t}$ we would have $T_0 d_k e_k$ equal to \tilde{c}_k , which implies \tilde{c}_k complex exponential Fourier series coefficient of $\tilde{x}(t)$ which is the periodic convolution of $x_1(t)$ and $x_2(t)$ is $T_0 \tilde{c}_k d_k$ this is the CEFS coefficient k th CEFS coefficient of periodic.

(Refer Slide Time: 27:43)

$$\sum_{k=-\infty}^{\infty} \tilde{c}_k e^{jk\omega_0 t}$$

$$\tilde{c}_k = T_0 d_k e_k$$

k th CEFS coefficient of periodic convolution of $x_1(t), x_2(t)$.

This is the k th CEFS coefficient of the periodic convolution of $x_1(t)$ and $x_2(t)$. Let us say that completes basically that completes our discussion of examples for the discrete Fourier series that is the complex exponential Fourier series and the trigonometric Fourier series of continuous time periodic signals in subsequent module, that is starting with the next module we look at examples for the Fourier transform, that is the Fourier expansion for or the Fourier analysis for continuous time a periodic signal all right. So, let us stop here and continue in the later modules.

Thank you very much.
