**Fourier Analysis Examples - Fourier Transform of Square Pulse, Fourier Transform of Sinc Pulse**

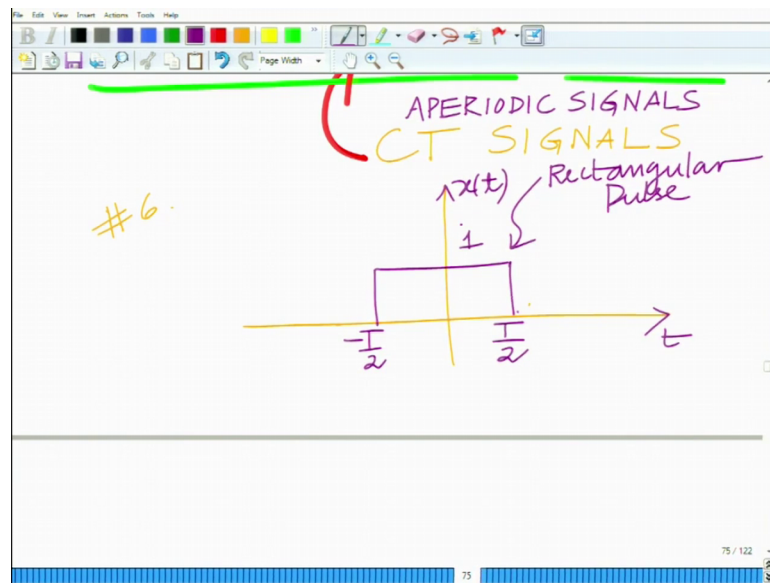

Hello, welcome to another module in this massive of online course. So, we looking at the Fourier analysis, and we looking at the example problems in the Fourier analysis and so far. We focused on example problems for discrete type signals let us now shift or focus to example problems for continuous time signals ok. So, starting this module we were going to look at again example problems for the Fourier analysis and this time specifically focusing on your continuous time signals.

(Refer Slide Time: 00:36)

The C T or continuous time signals let us start with example continuing our example numbers.

(Refer Slide Time: 01:15)

Let us start with example number 6, let us consider a very simple but yet fundamental signal and this we will encounter in various applications, that is let us say I have a signal or rudimentary a very basic signal that looks something like this. So, pulses continuous time signals and aperiodic remember we have looked at, so far. We have looked at continuous aperiodic signal periodic signals, so of the Fourier series.

Let us look at now continuous aperiodic signals ok. So, this is a pulse a rectangular pulse if you will. So, this is a rectangular pulse of width  $T$ . So, from minus  $T/2$  to  $T/2$  of height unity this is in time domain, this is the signal  $x(t)$  we denote this as the pulse.

(Refer Slide Time: 02:23)

$$x(t) = P_T(t) = \begin{cases} 1 & |t| \leq \frac{T}{2} \\ 0 & \text{otherwise} \end{cases}$$

Pulse of width =  $T$   
Height =  $1$   
Centered at  $0$ .

$x(t)$  equals  $P_T$  pulse of width  $t$  of  $t$   $P_T$  of  $t$  which to define it formally that is denoted by pulse of width  $t$ , this is basically 1 for magnitude of  $t$  less than or equal to capital  $T$  over 2 and this is 0 otherwise, and this is pulse of width  $t$  pulse of height unity width  $t$  centered at 0. So, 1 of the way to think about is this pulse of width equal to  $T$  height equals unity. And this is centered at 0 now we want to find the Fourier transform of this.

(Refer Slide Time: 03:31)

$$P_T(t) \longleftrightarrow P_T(\omega)$$

Pulse of width =  $T$   
Height =  $1$   
Centered at  $0$ .

$P_T$  of  $t$  let us denote this Fourier transform by capital  $P_T$  of  $\omega$  that is the Fourier transform of this pulse.

(Refer Slide Time: 03:46)

A screenshot of a presentation slide showing a handwritten equation. At the top, a horizontal double-headed arrow is labeled  $P_T(t)$  on the left and  $P_T(\omega)$  on the right. Below this, the equation is written as:

$$P_T(\omega) = \int_{-\infty}^{\infty} P_T(t) e^{-j\omega t} dt$$

The equation is followed by a partial second line:  $= \int$ . The slide includes a toolbar at the top and a footer with the number 77.

And remember the expression for the Fourier transform, the continuous time Fourier transform that is your integral minus infinity to infinity,  $P_T$  of  $t$   $e$  raise to minus  $j$   $\omega$   $t$   $d t$ , which is basically non-zero only from minus  $T$  to  $T$  by 2.

(Refer Slide Time: 04:12)

A screenshot of a presentation slide showing a handwritten derivation of the Fourier transform integral. The equation is written as:

$$P_T(\omega) = \int_{-\infty}^{\infty} P_T(t) e^{-j\omega t} dt$$

$$= \int_{-T/2}^{T/2} e^{-j\omega t} dt$$

$$= \frac{e^{-j\omega t}}{-j\omega} \Big|_{-T/2}^{T/2}$$

The final line shows the integral evaluated between the limits  $T/2$  and  $-T/2$ . The slide includes a toolbar at the top and a footer with the number 77.

So, I can write this as this becomes your integral minus  $T$  by 2 to  $T$  by 2 which is 1 in this range. So, it is simply  $e$  raise to minus  $j$   $\omega$   $t$   $d t$  and taking the integral this will be  $e$  raise to minus  $j$   $\omega$   $t$  divided by minus  $j$   $\omega$  between the limits; obviously, between the limits minus  $T$  by 2 to  $T$  by 2.

(Refer Slide Time: 04:58)

The image shows a whiteboard with handwritten mathematical equations. The first equation is 
$$= \frac{e^{-j\omega T/2} - e^{j\omega T/2}}{-j\omega}$$
 with a red  $-j\omega$  written above the denominator and a  $1 - T/2$  written above the second exponential term. The second equation is 
$$= \frac{-2j \sin(\omega T/2)}{-j\omega}$$
. The third equation is 
$$= \frac{2 \sin(\omega T/2)}{\omega}$$
. The whiteboard has a toolbar at the top and a status bar at the bottom showing '78 / 122'.

So, this integral is  $e$  raised to minus  $j$   $\omega$   $t$  divided by minus  $j$   $\omega$  evaluated between the limits minus  $T$  by 2 to  $T$  by 2. Now substituting the limits we have  $e$  raised to minus  $j$   $\omega$   $T$  by 2 minus,  $e$  raised to  $j$   $\omega$   $T$  by 2 divided by minus  $j$   $\omega$ , and we know that  $e$  raised to minus  $j$   $\omega$   $T$  by 2 minus  $e$  raised to  $j$   $\omega$   $T$  by 2  $T$  over 2, is basically  $\sin \omega$  or  $2 j \sin \omega$   $T$  over 2.

So, I can simplify this as  $2 j$  using the properties of the complex numbers that is  $e$  raised to minus  $j$   $\theta$  minus  $e$  raised to  $j$   $\theta$  ok, so  $2 j \sin \omega$   $T$  by 2 by. In fact, this is minus  $2 j \sin \omega$   $T$  by 2 by minus  $j$   $\omega$  which is basically you can simplify this by cancel this will be  $\sin \omega$   $T$  by 2 divided by or twice  $\sin \omega$   $T$  by 2 divided by  $\omega$ , and this you can mult this is your  $P T \omega$ .

(Refer Slide Time: 06:34)

The image shows a whiteboard with a software interface at the top. The derivation is as follows:

$$P_T(\omega) = \frac{2 \sin(\omega T/2)}{\omega}$$
$$= \frac{2 \frac{T}{2} \sin(\omega T/2)}{(\omega T/2)}$$
$$= \frac{T \sin(\omega T/2)}{\omega T/2}$$

The page number 78 is visible in the bottom right corner.

That is the Fourier transform of this pulse and you can multiply and divide by  $T$  over  $2$ . So, this is twice  $T$  over  $2$   $\sin$   $\omega T$  by  $2$  divided by  $\omega T$  over  $2$ , which is equal to  $T \sin \omega T$  over  $2$  divided by  $\omega T$  over  $2$ . And further I can also write this as remember we still simplifying the same expression.

(Refer Slide Time: 07:16)

The image shows a whiteboard with a software interface at the top. The derivation is as follows:

$$= \frac{T \sin\left(\frac{\omega T}{2\pi}\right)}{\pi \cdot \frac{\omega T}{2\pi}}$$
$$\text{sinc } u = \left( \frac{\sin \pi u}{\pi u} \right)$$

An arrow points from the text "sinc Function" to the definition of the sinc function. The page number 79 is visible in the bottom right corner.

I can write this as  $T \sin \pi \omega T$  over  $2 \pi$  times  $\pi \omega T$  over  $2 \pi$  and we will now define a notation that is a popular notation this is known as the sinc functions  $\text{sinc}$  of  $x$  or  $\text{sinc}$  of  $u$  equals  $\sin \pi u$  divided by  $\pi u$ . So, this is known as the sinc function and its 1

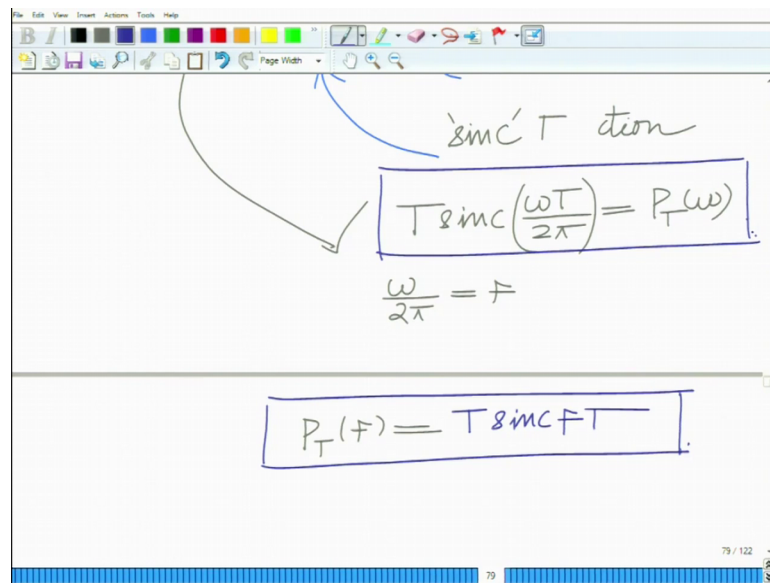

of the most very convenient and very frequently something that is very convenient use something that arises very frequently in communications and signal processing in general and in general signals and systems. So, this is termed as the sinc this is the sinc function and therefore, this here.

(Refer Slide Time: 08:19)

The image shows a handwritten derivation on a whiteboard. At the top, the expression  $T \frac{\sin(\frac{\omega T}{2\pi})}{\pi \cdot \frac{\omega T}{2\pi}}$  is written. Below it, the definition of the sinc function is given as  $\text{sinc } u = \left( \frac{\sin \pi u}{\pi u} \right)$ . A blue arrow points from this definition to the top expression, indicating that the top expression is  $T \text{sinc}(\frac{\omega T}{2\pi})$ . Below the definition, the text "sinc function" is written. Further down, the Fourier transform pair is shown as  $T \text{sinc}(\frac{\omega T}{2\pi}) = P_T(\omega)$ . At the bottom, the substitution  $\frac{\omega}{2\pi} = f$  is written.

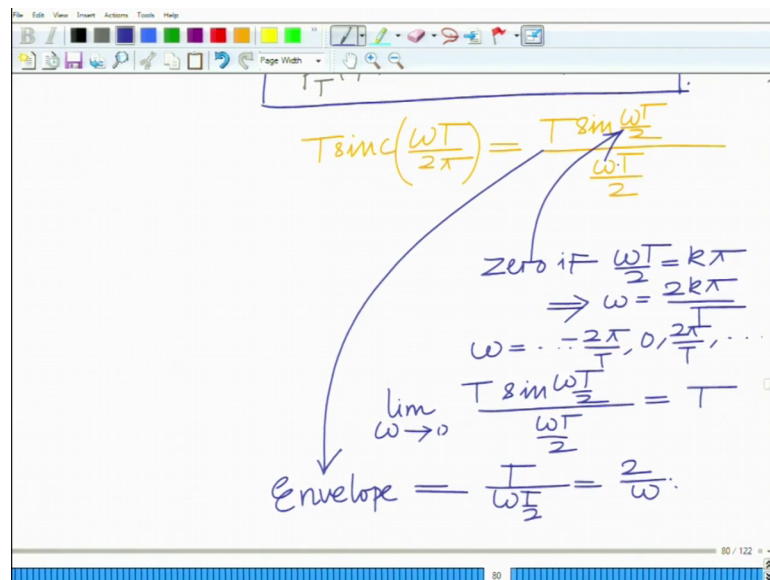

Will simply be  $T \text{sinc}(\frac{\omega T}{2\pi})$  or  $T \text{sinc}(\frac{\omega T}{2\pi})$ , and this is your  $P_T(\omega)$ . And further if we denote  $\frac{\omega}{2\pi}$  as the angular frequency  $\frac{\omega}{2\pi}$  is a frequency  $f$ , then this simply becomes  $T \text{sinc}(fT)$ . So, substituting  $\frac{\omega}{2\pi}$  equals  $f$  you can write.

(Refer Slide Time: 09:05)

$P_T$  that is the Fourier transform in terms of the frequency  $P_T$  of  $f$ , this will be equal to  $T \text{sinc}(f T)$ , or  $T \text{sinc}\left(\frac{\omega T}{2\pi}\right)$  and if you plot this  $T \text{sinc}\left(\frac{\omega T}{2\pi}\right)$

(Refer Slide Time: 09:34)

Equals  $T \sin\left(\frac{\omega T}{2}\right)$  divided by  $\frac{\omega T}{2}$ , and you can see that  $\sin\left(\frac{\omega T}{2}\right)$  is 0. If the numerator is 0 if  $\frac{\omega T}{2} = k\pi$  implies  $\omega = \frac{2k\pi}{T}$ .

So, this is 0 for omega equals for instance minus 2 pi by T is 0 2 pi by T and so on. For pi by T and so on ok, and as limit, remember limit omega tends to 0 you can check this sinc omega T by 2 by omega T by 2 this is equal to T. So, T equal to 0 this is T ok this T sinc omega T over 2 pi at T at omega equal to 0 this is T this is magnitude T and it is 0 at every integer multiple of that is 2 k pi over T, where T is the width of the path at every integer multiple of 2 pi over T ok.

And you can see that the amplitude of this is decreasing this is amplitude is decreasing as T over omega. So, if you look at the envelop of this is something is interesting envelope which is places where the sin has magnitude 1. So, that will be T over omega T over 2 which is basically equal to twice over omega.

(Refer Slide Time: 11:50)

The image shows a whiteboard with handwritten mathematical derivations. At the top, the values of  $\omega$  are listed as  $\omega = \dots, -\frac{2\pi}{T}, 0, \frac{2\pi}{T}, \dots$ . Below this, the limit is calculated:  $\lim_{\omega \rightarrow 0} \frac{T \sin \frac{\omega T}{2}}{\frac{\omega T}{2}} = T$ . An arrow points from this limit to the equation for the envelope:  $\text{Envelope} = \frac{T}{\frac{\omega T}{2}} = \frac{2}{\omega}$ . A second arrow points from the envelope equation to the text "decreasing as  $\frac{1}{\omega}$ ".

So, this is linearly sorry decreasing in omega linearly decreasing in omega or not linearly this is decreasing inversely in omega, and with that we can plot this.

(Refer Slide Time: 12:06)

So, if I try to plot this, so this will be something which is of height  $T$  with the decreasing envelope and these points. So, this is  $T$  and these points where it is  $0$   $2\pi$  by  $T$  at  $0$  it is  $T$  this point will be  $4\pi$  by  $T$  and.

So, on this on  $\omega$  axis and this point will again be minus  $2\pi$  by  $T$  minus  $4\pi$  over  $T$  and so on. And this is your sinc function,  $\text{sinc}$  of  $\omega T$  over  $2\pi$  times  $T$  and this is equal to your  $P_T$  of  $\omega$  ok, this is what we know as sinc function and you can, you can see the envelope the something that is decreasing. Envelope is decreasing as  $2$  over  $\omega$  something that is decreasing that is the  $\omega$  tends to infinity, the signal or the response of the signal right the Fourier transform tends to  $0$ .

And this is important as said because it arises in a line as a large number of applications related to communication and signal processing, because the pulse where pulse itself something that is very fundamental to several applications ok. Now let us look at something interesting, which is we look at what is the now using the Fourier transform of sinc pulse now let us look at the inverse Fourier transform of the sinc pulse so.

(Refer Slide Time: 14:05)

#8) FT of Sinc Pulse:

$$x(t) = \text{sinc}(\alpha t) = \frac{\sin \pi \alpha t}{\pi \alpha t}$$

$X(\omega) = ?$

Or let us look at we are looked the Fourier transform the square pulse let us look at the Fourier transform of sinc pulse. And leadless to say we can use the duality principle, that is what we want to do is we want to consider a signal  $x(t)$ , which is sinc of  $\alpha t$ , which is basically  $\sin \pi \alpha t$  over  $\pi \alpha t$ , and we want to ask the question what is the Fourier transform of this sinc pulse.

Now the Fourier transform of this sinc pulse we can use the duality principle as well we know that the Fourier transfer of square pulse is the sinc in the frequency domain. So, using duality you can already see if you look at the sinc pulse at the time domain. Fourier transform must be related to that of square pulse in the frequency domain all right, so we use.

(Refer Slide Time: 15:15)

Handwritten notes on a whiteboard:

$$x(t) = \text{sinc}(\alpha t) = \frac{\sin \pi \alpha t}{\pi \alpha t}$$

An arrow points from the expression above to:

$$X(\omega) = ?$$

Below this, the word "DUALITY:" is underlined, followed by:

$$x(t) \longleftrightarrow X(\omega)$$

$$X(t) \longleftrightarrow 2\pi x(-\omega)$$

The slide number 82 is visible in the bottom right corner.

The duality principle all right which states that if  $x(t)$  has Fourier transform  $X(\omega)$  then  $X(t)$  that is  $X$  of  $t$ , must have Fourier transform we have already seen this  $2\pi x(-\omega)$  this follows from the duality principle.

(Refer Slide Time: 15:45)

Handwritten notes on a whiteboard:

DUALITY:

$$x(t) \longleftrightarrow X(\omega)$$

$$X(t) \longleftrightarrow 2\pi x(-\omega)$$

$$P_T(t) \longleftrightarrow T \text{sinc} \frac{\omega T}{2\pi}$$

---

$$\Rightarrow T \text{sinc} \left( \frac{tT}{2\pi} \right) \longleftrightarrow 2\pi P_T(-\omega) = 2\pi P_T(\omega)$$

The slide number 83 is visible in the bottom right corner.

So, now we have  $P_T$  remember from the previous problem,  $P_T(t)$  has the Fourier transform  $T \text{sinc} \frac{\omega T}{2\pi}$ . Now using the duality it follows that if we replace a  $\omega$  by  $T$  that is  $T \text{sinc} T \text{ times } T \text{ divided by } 2\pi$ , this has the Fourier transform  $P$  of  $T$  or  $2\pi$ , this has the Fourier transform  $2\pi P_T$  of  $-\omega$ . Now look at this is

the pulse, right the pulse is an even function correct we have seen as the pulse is centered at 0, right it is symmetric about 0. So, P T of minus omega is same as P T of omega, so this is equal to twice 2 pi P T of omega since pulse is an even function.

(Refer Slide Time: 16:53)

$$P_T(t) \leftrightarrow T \operatorname{sinc} \frac{\omega T}{2\pi}$$

$$\Rightarrow T \operatorname{sinc} \left( \frac{tT}{2\pi} \right) \leftrightarrow \begin{matrix} 2\pi P_T(-\omega) \\ = 2\pi P_T(\omega) \end{matrix}$$

since  $P_T(\omega)$   
= even function

$$\Rightarrow \operatorname{sinc} \frac{tT}{2\pi} \leftrightarrow \frac{2\pi}{T} P_T(\omega)$$

Since your square pulse is since or since P T of omega equals is an even function ok, and this implies that if you look at sinc t times T by 2 pi, that has the Fourier transform which you take to T into the other side that has the Fourier transform 2 pi over T P T omega now said.

(Refer Slide Time: 17:34)

$$\Rightarrow \operatorname{sinc} \frac{tT}{2\pi} \leftrightarrow \frac{2\pi}{T} P_T(\omega)$$

since  $P_T(\omega)$   
= even function

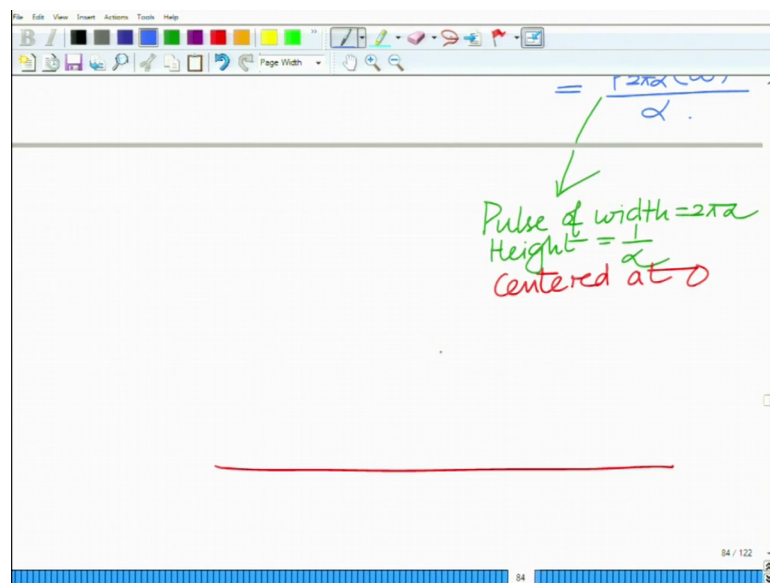

$$\frac{T}{2\pi} = \alpha \Rightarrow T = 2\pi\alpha$$

$$\operatorname{sinc}(\alpha t) \leftrightarrow \frac{2\pi P_{2\pi\alpha}(\omega)}{2\pi\alpha} = \frac{P_{2\pi\alpha}(\omega)}{\alpha}$$

$t$  over  $2\pi$  equals  $\alpha$  implies  $T$  equals  $2\pi/\alpha$  and therefore, from here you will have  $\text{sinc}(\alpha t)$ , has the Fourier transform which is  $2\pi$  over  $t$ . So, this will be your, I am sorry I am setting  $T = 2\pi/\alpha$ . So, this will be  $T$  equals, so you will have  $2\pi$  over  $T$  will be  $2\pi$  over  $2\pi/\alpha$  and  $P$  of  $T$  is  $2\pi/\alpha$   $2\pi/\alpha$   $\omega$  which is nothing, but  $P$  of  $2\pi/\alpha$  divided by  $\alpha$ .

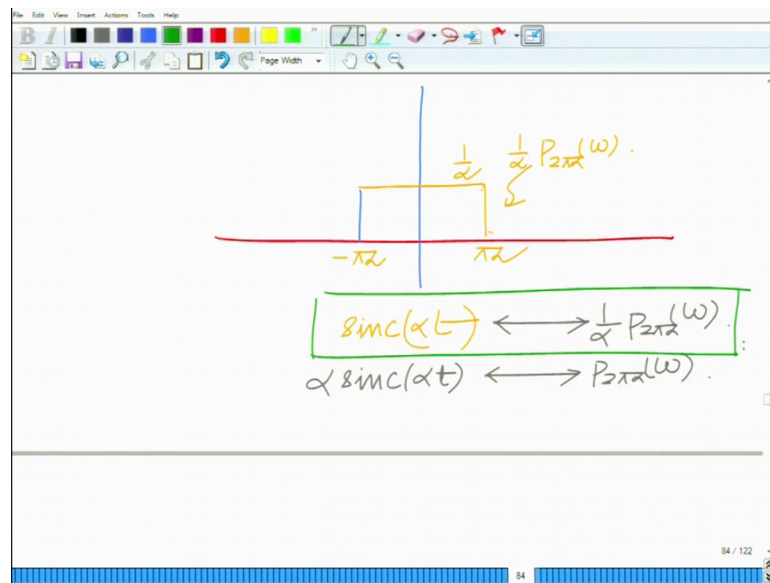

Now, if you look at the  $P$  of  $2\pi/\alpha$  that is nothing, but pulse of width  $2\pi/\alpha$  centered at 0 and height 1, now you have  $1$  over  $\alpha$  times. So, the height will be  $1$  over  $\alpha$  this is pulse of a  $1$  over  $\alpha$   $P$   $2\pi/\alpha$   $\omega$  is a height is a pulse of height  $1$  over  $\alpha$  and frequency domain centered at 0 and of width  $2\pi/\alpha$  therefore, its spans from minus  $\pi/\alpha$  to  $\pi/\alpha$  ok. So, therefore, this will be if you realize that you can see.

(Refer Slide Time: 19:01)

This is this is pulse of width  $2\pi/\alpha$ , height equals  $1$  over  $\alpha$  centered at 0. So, therefore, this is going to be something that is that looks like this just going to draw it.

(Refer Slide Time: 19:34)

This is from minus pi alpha 2 pi alpha height 1 over alpha, and this is your P of 2 pi alpha 1 over alpha and this is the Fourier transform that is of alpha this is the Fourier transform of sinc alpha T.

So, sinc alpha T which is mode be set out to find the Fourier transform of has the Fourier transform 1 over alpha P 2 pi alpha P 2 pi alpha omega and therefore, this also implies that if you bring the alpha to the left hand side alpha sinc alpha T has the Fourier transform P 2 pi alpha times omega. That is basically what we have over here and another simple manipulation if you look at, so if you set alpha equals and if you set alpha.

(Refer Slide Time: 21:10)

$$\alpha = \frac{a}{\pi}$$

$$\frac{a}{\pi} \cdot \text{sinc}\left(\frac{a}{\pi} t\right) \leftrightarrow P_{2a}(\omega)$$

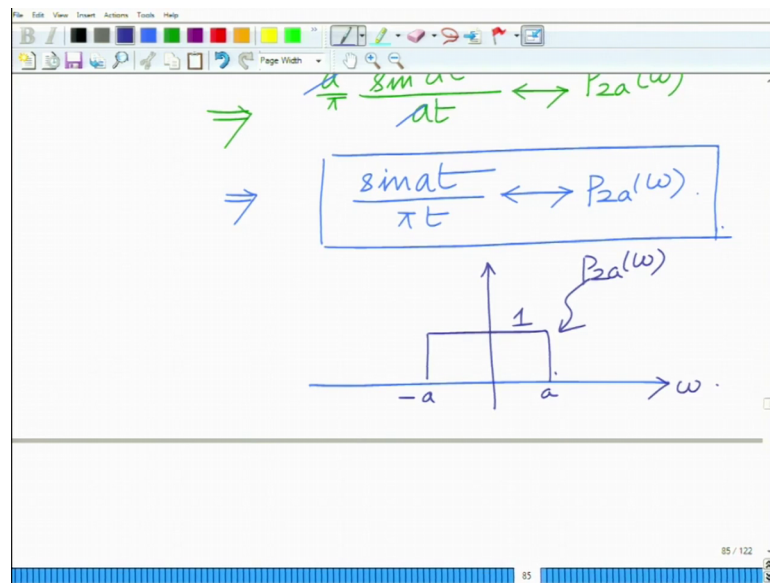

$$\Rightarrow \frac{a}{\pi} \frac{\sin at}{at} \leftrightarrow P_{2a}(\omega)$$

$$\Rightarrow \boxed{\frac{\sin at}{\pi t} \leftrightarrow P_{2a}(\omega)}$$

Equals  $a$  over  $\pi$ , this gives  $a$  over  $\pi$  sinc  $a$  over  $\pi$   $t$  is your  $P$  of  $2$   $\pi$   $\alpha$   $\alpha$  equals  $a$  over  $\pi$ . So, this is  $p$  of  $2$   $a$   $\omega$  now remember sinc of  $x$  is  $\sin$  of  $\pi$   $x$  divided by  $\pi$   $x$ . So, this will be your this implies that  $a$  over  $\pi$  times  $\sin$   $\pi$  over  $\pi$   $t$  that is  $\sin$   $a$   $t$  divided by  $\pi$   $a$  over  $\pi$   $t$  that is  $\sin$  of  $\pi$  over.

So, that is  $a$   $t$  that has the Fourier transform,  $P$  of  $2$   $a$  of  $\omega$  which implies that which implies that now you have  $a$  is cancelling. So,  $\sin$   $a$   $t$  by  $t$  equal to which implies that  $\sin$   $a$   $t$  by  $\pi$   $t$  has the Fourier transform that is  $P$  of  $2$   $a$  of  $\omega$ , so  $\sin$  of  $\pi$   $t$  by  $\pi$   $a$   $t$  and this is basically.

(Refer Slide Time: 22:48)

You can see this is pi pulse of height 1 width 2 a, this is your P of 2 a of omega and this has the. So,  $\frac{\sin at}{\pi t}$  has the Fourier transform of  $2 a \omega$ , which is the pulse of width 2 a that is from minus a centered at 0 from minus a to a and of height 1 in a frequency domain, in the angular frequency domain omega domain all right . So, with we will stop here and continue with other problems in the Fourier analysis for continuous time signals in the subsequent modules.

Thank you very much.
