Lecture – 68

Example Problems: DFT – DFT, IDFT in Matrix form

Hello. Welcome to another module in this massive open online course. So, we are looking at example problems in the discrete Fourier transform and a inverse discrete Fourier transform, alright.

(Refer Slide Time: 00:23)

So, we are looking at example problems, for the discrete Fourier transform. In particular, what we would like to explore is? we would like to write, this DFT the discrete Fourier transform and the IDFT in a matrix form, that will be in particular a very convenient for evaluating the DFT and IDFT, as well as representing them as a linear transformations, all right.

So, what we want to do, is given, \bar{x} , the finite length signal, that is x_0, x_1 , up to x_{N-1} . And, well you can see this is the N samples. Correct?

(Refer Slide Time: 01:30)

The image shows a whiteboard with handwritten mathematical definitions. On the left, a blue vector \bar{x} is defined as $\begin{bmatrix} x(0) \\ x(1) \\ \vdots \\ x(N-1) \end{bmatrix}$. On the right, a red vector \bar{X} is defined as $\begin{bmatrix} X(0) \\ X(1) \\ \vdots \\ X(N-1) \end{bmatrix}$. Below these, red text states " $N \times 1$ vector = N samples". To the right of the \bar{X} vector, yellow text says "DFT Coefficients". In the center, green text provides the equations: $\bar{X} = W_N \bar{x}$ and $\bar{x} = W_N^{-1} \bar{X}$. The whiteboard interface includes a toolbar at the top and a page number "101 / 133" at the bottom.

So, these are n cross 1 vector corresponds to N samples, ok N length signal. And, we also have correspondingly \bar{x} , which is the vector of DFT coefficients. That is we have, naturally, N DFT coefficients x_0, x_1, \dots, x_{N-1} this is your vector of DFT coefficients. And, what we want to do is, we want to Express the DFT \bar{x} equals vector W , in fact, N corresponding to the N length DFT \bar{x} and also, \bar{x} the signal, as the inverse DFT of length N times \bar{X} .

(Refer Slide Time: 02:42)

This image is a continuation of the whiteboard notes. It features the same equations as the previous slide: $\bar{X} = W_N \bar{x}$ and $\bar{x} = W_N^{-1} \bar{X}$. The text " $N \times 1$ vector = N samples" and "DFT Coefficients" is repeated. A purple arrow points from the W_N term in the first equation to the text "DFT matrix". Another purple arrow points from the W_N^{-1} term in the second equation to the text "IDFT matrix". A blue arrow points from the word "Linear" to the equations, with "Transforms" written below it. The whiteboard interface and page number "101 / 133" are also visible.

So, this expresses these things, as a transformation. So, these are the matrix. This is called the DFT matrix, and this is the IDFT matrix; the inverse transform. So, we are representing the DFT and IDFT as linear transformations, ok. So, these are basically your, Linear representing the DFT and IDFT as a linear transformation.

(Refer Slide Time: 03:20)

DFT given as

$$X(k) = \sum_{n=0}^{N-1} x(n) W_N^{kn}$$

$$X(0) = x(0) + x(1) + \dots + x(N-1)$$

$$X(1) = x(0) + x(1) W_N + x(2) W_N^2 + \dots + x(N-1) W_N^{N-1}$$

Now, the DFT realized; the DFT is given as, well, the n point DFT is summation n equal to 0 to N minus 1 x n into WN raised to the power k n. So for instance you have your X 0 which is, x 0 plus x 1 plus so on plus x N minus 1 into x N minus 1 that is it WN raised to k is 0, so this will be 1.

And similarly, if you look at X 1, ok. X 1 will be again x 0 plus x 1 times WN k equals 1 N equals 1, so plus WN plus x 2 WN; well, k equals 1 N equals 2 so WN square plus x N minus 1 WN raised to N minus 1.

(Refer Slide Time: 04:56)

The image shows a whiteboard with two equations written in blue and red ink. The top equation, written in blue, is:

$$X(2) = x(0) + x(1)W_N^2 + x(2)W_N^4 + \dots + x(N-1)W_N^{2(N-1)}$$

The bottom equation, written in red, is:

$$X(N-1) = x(0) + x(1)W_N^{(N-1)} + x(2)W_N^{2(N-1)} + \dots + x(N-1)W_N^{(N-1)^2}$$

The whiteboard also shows a toolbar at the top and a page number '103 / 133' at the bottom right.

This is $X(2)$. You can see $x(0)$ plus $x(1)$ W_N^2 plus $x(2)$ W_N^4 plus $x(N-1)$ $W_N^{2(N-1)}$ and so on. Correct? And so on, what we are trying to do is we are trying to develop a linear transformation that is a matrix representation for this DFT.

And, if you look at $x(N-1)$, that is the N th DFT point that is going to be $x(0)$ plus $x(1)$ W_N^{N-1} plus $x(2)$ $W_N^{2(N-1)}$ plus $x(N-1)$ $W_N^{(N-1)^2}$ and so on. So that will be W_N raised to $(N-1)^2$.

(Refer Slide Time: 06:21)

Handwritten equation in red ink:

$$X(N-1) = x(0) + x(1)W_N + x(2)W_N^2 + \dots + x(N-1)W_N^{(N-1)^2}$$

Below the equation, written in green ink:

Write in Matrix Form

And you put all these things together, as a matrix, so you write a Matrix Form.

(Refer Slide Time: 06:38)

Handwritten matrix equation:

$$\begin{bmatrix} X(0) \\ X(1) \\ X(2) \\ \vdots \\ X(N-1) \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 & \dots & 1 \\ & W_N & W_N^2 & \dots & W_N^{(N-1)} \\ & & W_N^2 & \dots & W_N^{2(N-1)} \\ & & & \dots & \\ & & & & W_N^{(N-1)^2} \\ & & & & & W_N & \dots & W_N^{(N-1)} \\ & & & & & & W_N^2 & \dots & W_N^{2(N-1)} \\ & & & & & & & \dots & \\ & & & & & & & & W_N^{(N-1)^2} \end{bmatrix} \begin{bmatrix} x(0) \\ x(1) \\ \vdots \\ x(N-1) \end{bmatrix}$$

Labels and notes:

- $\begin{bmatrix} X(0) \\ \vdots \\ X(N-1) \end{bmatrix}$ is labeled as $N \times 1$ vector \bar{X} and DFT vector.
- The matrix is labeled as $N \times N$ matrix = DFT matrix.
- $W_N = e^{-j2\pi/N}$
- $\begin{bmatrix} x(0) \\ \vdots \\ x(N-1) \end{bmatrix}$ is labeled as $N \times 1$ signal vector \bar{x} .

Final boxed equation:

$$\bar{X} = W_N \bar{x}$$

And what you are going to have is. You are going to have on the left you have this n dimensional vector of DFT coefficients $X_0 X_1$ up to capital X_{N-1} ; these are the capital X 's, ok. These are the n dimensional DFT coefficients, this is this matrix. Correct?

1 1 the first will be all 1's 1 times X_0 . So, you look at this into what is multiplying each element of the signal. You look at what is multiplying each component of the signal. The first entries will all be 1; 1 times x_0 plus 1 times x_1 so on up to 1 times x_{N-2} plus so on;

so on 1 times x N minus 1 x 1 will be 1 times x 0 plus W N times x 1 plus W N square times x 2 plus W N raised to N minus 1 times x N minus 1. X 2 will be 1 times x 0 plus W N square times x 2 plus W a W N square times x 1 plus W N 4 times x 2 plus W N raised to 2 N minus 1 times X N minus 1. And the last entry, last row will be X N minus 1 will be W N raised to N minus 1 times x 1 W N raised to 2 N minus 1 times x 2 and W N raised to N minus 1 square times N minus 1 square times X N minus 1.

And therefore, if you look at this; this is an N cross 1 vector and if you look at this; this is an N cross N matrix and this is your DFT matrix of size N. Where recall, W N equals e raised to minus j 2 pi over N And this is your N cross 1. This is your N cross 1 signal vector and this capital X bar this is the n cross one DFT vector. So, this is your X bar, this is your W N and this is your X bar. So, we are able to write; we are able to write X bar equals W N times X bar. Ok? Where, W N is basically your DFT matrix. Ok? So, that is basically, the structure of the DFT matrix.

(Refer Slide Time: 10:27)

$$\bar{X} = W_N \bar{x}$$

$$W_N = e^{-j 2 \pi / N}$$

$$x(n) = \frac{1}{N} \sum_{k=0}^{N-1} X(k) W_N^{-kn}$$

$$= \frac{1}{N} \sum_{k=0}^{N-1} X(k) e^{-j 2 \pi kn / N}$$

Now, you can do similarly for the IDFT matrix. Now realize, that the inverse discrete Fourier transform is also, is given as; if you look at each coefficient x of k, if you look at each coefficient, we have the expression for the IDFT, x n or I am sorry x small n equals 1 over capital N summation k equal to 0 to N minus 1 X k W N raised to minus k n, ok, e raised to j 2 pi k small n or capital N. Ok, W N raised to minus k which is also as I said,

this is $\frac{1}{N} \sum_{k=0}^{N-1} X_k e^{j 2 \pi k n \text{ over } N}$. Ok.

(Refer Slide Time: 11:25)

Handwritten mathematical derivation of the IDFT matrix. The equation shown is:

$$x(n) = \frac{1}{N} \sum_{k=0}^{N-1} X_k e^{j 2 \pi k n / N}$$

Below this, the IDFT matrix W_N is defined as:

$$W_N^{-1}(i,j) = W_N^{-1}(j,i) = W_N^{-1}(j,i) = W_N^{-1}(j,i)$$

The matrix is shown as a product of a $\frac{1}{N}$ scalar, an $N \times N$ matrix of powers of W_N , and an $N \times 1$ vector of DFT coefficients X_k . The $N \times 1$ vector is labeled "signal vector" and the $N \times N$ matrix is labeled "IDFT matrix".

And now you can again write this as the following matrix. Now, the outputs will be the signal samples, the inverse DFT, and the corresponding IDFT matrix. First you have this scaling factor 1 over N, that is there and, the input will be the DFT coefficients x_0 to x_{N-1} . And the IDFT matrix will be, $\frac{1}{N}$ times 1 plus W_N^{-1} to the power minus 1 into x_1 plus W_N^{-2} to the power minus 2 into x_2 plus W_N^{-N-1} into x_{N-1} .

Similarly, x_2 is and overall divided by 1 of divided by capital N, ok. And capital X 2 or small x 2 will be $\frac{1}{N}$ times 1 capital X 0 W_N^{-2} capital X 1 W_N^{-4} capital X 2 W_N^{-6} capital X N minus 1 and finally, x_{N-1} will be $\frac{1}{N}$ times 1 capital X 0 W_N^{-N-1} capital X 1 W_N^{-2N-1} capital X 2 plus and so on. W_N^{-N-1} square times capital X N minus 1.

And, if you look at this, now this is in fact, this including the scaling factor 1 over N, this is W_N^{-1} . This is your $N \times N$ IDFT matrix. Ok? And, this is your $N \times 1$ DFT coefficient vector X . Ok, the input is the DFT vector and output is the $N \times 1$ signal vector.

(Refer Slide Time: 14:15)

$$\boxed{\bar{x} = \tilde{W}_N X} \quad (2)$$

From (1) (2)

$$\bar{x} = \tilde{W}_N X = \tilde{W}_N W_N \bar{x}$$
$$\Rightarrow \bar{x} = \tilde{W}_N W_N \bar{x}$$

And you can see therefore, that I can write this \bar{x} equals \tilde{W}_N times X and if you call this equation 2 and you call this equation 1, it is but natural to see that, you have \bar{x} equals now, from 1 and 2 equals \tilde{W}_N into X equals now substitute for X bar capital X bar from 1, that is \tilde{W}_N into W_N into small x bar.

(Refer Slide Time: 15:17)

$$\Rightarrow \bar{x} = \tilde{W}_N W_N \bar{x}$$
$$\Rightarrow \boxed{\tilde{W}_N W_N = I}$$
$$W_N \tilde{W}_N = I$$
$$\Rightarrow W_N = \tilde{W}_N^{-1}$$
$$\Rightarrow \tilde{W}_N = W_N^{-1}$$

So, we have \bar{x} equals \tilde{W}_N into W_N into \bar{x} . This implies that \tilde{W}_N into W_N equals identity must be equal to identity, right? Correct? You have \bar{x} equals, so you have the matrix, \bar{x} the vector remaining unchanged \bar{x} equals a \bar{x} and that

happens for every vector \bar{x} , ok. Remember it is not specific to a certain vector \bar{x} , happens for every vector \bar{x} which means; that the matrix a must be identity. All right, which means, W_N^{-1} is the inverse of W_N . Similarly, W_N is the inverse of W_N^{-1} and that is what? And that is natural. Correct? Because, IDFT is the inverse of the DFT, the DFT is the inverse of the IDFT. Ok.

So therefore, $W_N^{-1} W_N$ equals identity similar. Similarly, $W_N W_N^{-1}$ equals identity, the inverse of a square matrix when exists is unique and is both; that is if $a b$ is identity for square matrices, then $b a$ is also identity, ok. So, $W_N^{-1} W_N W_N^{-1}$ equals identity. The DFT properties DFT and IDFT properties matrices satisfy this property. Ok.

(Refer Slide Time: 16:40)

$$\begin{bmatrix} X(0) \\ X(1) \\ X(2) \\ \vdots \\ X(N-1) \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 & \dots & 1 \\ W_N & W_N^2 & \dots & W_N^{(N-1)} \\ W_N^2 & W_N^4 & \dots & W_N^{2(N-1)} \\ \vdots & \vdots & \ddots & \vdots \\ W_N^{N-1} & W_N^{2(N-1)} & \dots & W_N^{(N-1)^2} \end{bmatrix} \begin{bmatrix} x(0) \\ x(1) \\ \vdots \\ x(N-1) \end{bmatrix}$$

$W_N(2,3) = W_N^2 = W_N(3,2)$
 $W_N(k,j) = W_N(j,k)$

$N \times 1$ vector \bar{X} (DFT vector)
 $N \times N$ matrix = DFT matrix
 $W_N = e^{-j2\pi \frac{kn}{N}}$
 $N \times 1$ signal vector \bar{x}

So, this implies; W_N equals W_N^{-1} inverse and this also implies; W_N^{-1} equals W_N inverse. Ok. So, DFT and IDFT matrixes satisfy these properties. And, further observe something very interesting if you observe this, you can see that, if you look at the elements, look at this; this is, if you look at the DFT matrix, this is the element, if you look at W_N , the element in the second row, third column is W_N^2 , which is also the element in the third row, second column. Look at this that is W_N^2 . Correct?

Similarly, you can compare that $W_N(i,j)$ equals $W_N(j,i)$ for all j you can see that. This means; that if you take the transpose of this matrix W_N it is equal to itself. Correct? Because, $W_N(i,j)$ is equal to that is; $W_N(j,i)$ equals $W_N(j,i)$

comma I. If you make the rows into columns and the columns into rows then that matrix remains unchanged, which means; that the DFT matrix is equal to the transpose of itself.

(Refer Slide Time: 17:55)

The image shows a whiteboard with handwritten mathematical notes. At the top left, there is a box containing $[X(N-1)]$ with a wavy line underneath, labeled "NX1 vector \bar{X} DFT vector". To its right is a matrix representation of the DFT: $[1 \quad W_N^{0(N-1)} \quad W_N^{1(N-1)} \quad \dots \quad W_N^{(N-1)(N-1)}]$, with a wavy line underneath and an arrow pointing to it labeled W_N . To the right of this matrix is a box containing $[x(N-1)]$ with a wavy line underneath, labeled "NX1 signal vector \bar{x} ". Below the matrix, it says "NXN = DFT matrix" and $W_N = e^{-j2\pi \frac{kn}{N}}$. In the center, there is a boxed equation: $\bar{X} = W_N \bar{x} \quad (1)$. To the left of this equation is another boxed equation: $W_N = W_N^T$. At the bottom, there are two equations for $x(n)$: $x(n) = \frac{1}{N} \sum_{k=0}^{N-1} X(k) W_N^{-kn}$ and $= \frac{1}{N} \sum_{k=0}^{N-1} X(k) e^{j2\pi \frac{kn}{N}}$. The whiteboard has a toolbar at the top and a footer at the bottom with the number 104.

So, there is an interesting property W_N equals W_N transpose. Is an important property so observe that; so property, this is property 1, let us call this property 1. The inverse property and property 2 equals is basically W_N equals W_N transpose and similarly you can also observe, if you look at the IDFT matrix once again, you can see that W_N tilde, for instance we let W_N tilde of 2 comma 3 second row third column that is W_N raised to minus 2 divided by N and W_N tilde of 3 comma 2 is W_N raised to minus 2 divided by N . So, we again have W_N tilde of i comma j equals W_N tilde of j comma i . This implies, W_N tilde equals W_N tilde transpose.

(Refer Slide Time: 19:09)

$$\Rightarrow W_N = \tilde{W}_N^{-1}$$

$$\Rightarrow \tilde{W}_N = W_N^{-1}$$

Prop 2:

$$W_N = W_N^T$$

$$\tilde{W}_N = \tilde{W}_N^T$$

So, we have W_N equals W_N transpose. And now, we come to another very interesting property. If you look at this, each element, now you look at W_N of 2 comma 3, ok, that is W_N square. All right, that is e raised to j that is; W_N square that is; e raised to $j^2 \pi$ into 2 or that is; e raised to $j^2 \pi$ over N . Now, if you look at W_N tilde of 2 comma 3 that is; W_N raised to minus 2 divided by N that is; e raised to e raised to $j^2 \pi$ over N whole divided by N .

(Refer Slide Time: 20:23)

Prop 2:

$$W_N = W_N^T$$

$$\tilde{W}_N = \tilde{W}_N^T$$

Prop 3: Ex: $W_N(2,3) = W_N^2 = e^{j^2 \pi / N}$

$$\tilde{W}_N(2,3) = \frac{1}{N} W_N^{-2} = \frac{1}{N} e^{j^2 \pi / N}$$

$$\Rightarrow \tilde{W}_N(2,3) = \frac{1}{N} (W_N(2,3))^*$$

So, you can see that these elements are complex conjugates of each other. So, if you look at this example and these are interesting properties, so what we have is? W_N of 2 comma 3 equals W_N this is the small w_n , this is the matrix W_N , this is W_N raised to 2 equals e raised to $j 2 \pi$ over N . 2π over N into 2 that is; e raised to $j 4 \pi$ over N , I am sorry e raised to minus $j 4 \pi$ over N .

Now, W_N tilde, the matrix W_N tilde of 2 comma 3 equals 1 over N W_N raised to minus 2 equals 1 over N e raised to $j 4 \pi$ over [noise] which implies; W_N tilde 2 comma 3 equals 1 over N . W_N 2 comma 3 conjugate and that is the interesting property. So, each element of the IDFT matrix is a corresponding conjugate of the element of the DFT matrix divided by capital N .

(Refer Slide Time: 21:33)

The image shows a whiteboard with handwritten mathematical derivations. The first part, labeled 'Prop 3', shows the derivation of the inverse DFT matrix \tilde{W}_N as the conjugate transpose of W_N scaled by $1/N$. The second part, labeled 'Prop 4', shows the identity $\tilde{W}_N W_N = I_{N \times N}$ and its equivalent form $\frac{1}{N} W_N^H W_N = I$.

$$\text{Prop 3: } \tilde{W}_N = \frac{1}{N} W_N^*$$

$$= \frac{1}{N} (W_N^T)^*$$

$$\boxed{\tilde{W}_N = \frac{1}{N} W_N^H}$$

Prop 4: $\tilde{W}_N W_N = I_{N \times N}$

$$\Rightarrow \frac{1}{N} W_N^H W_N = I$$

So, you can say, basically the entire matrix W_N tilde equals 1 over N , W_N conjugate and this is the interesting property and since, W_N conjugal W_N is W_N Hermitian, so the you can also say, this is also 1 over N W_N transpose conjugate, which is the same as 1 over N W_N Hermitian.

Remember, if you take the transpose and the conjugate that is; we take the conjugate that is the conjugate of each element transpose rows become columns, columns become rows. We can transpose and conjugate of each element that becomes the Hermitian. So, what you have is? W_N tilde is 1 over N times W_N Hermitian. Ok?

And therefore, since $W^H W$, so this is your property you can collectively call this as property 3 and therefore, now you come to property 4, which is basically, $W^H W = N I$. This implies that; now you see $W^H W$ is 1 over N $W^H W$ Hermitian. Which means; 1 over N $W^H W$ Hermitian, $W^H W$ equals identity, which implies; $W^H W$ Hermitian into $W^H W$ equals N times identity matrix. Ok.

(Refer Slide Time: 23:01)

The image shows a whiteboard with handwritten mathematical derivations. The top part shows the derivation of the inverse of W as $W^{-1} = \frac{1}{N} W^H$, which is also written as $\frac{1}{N} W^*$. The bottom part shows the derivation of $W^H W = N \cdot I$, where I is an $N \times N$ identity matrix.

$$\Rightarrow \frac{1}{N} W^H W = I$$

$$\Rightarrow W^H W = N \cdot I_{N \times N}$$

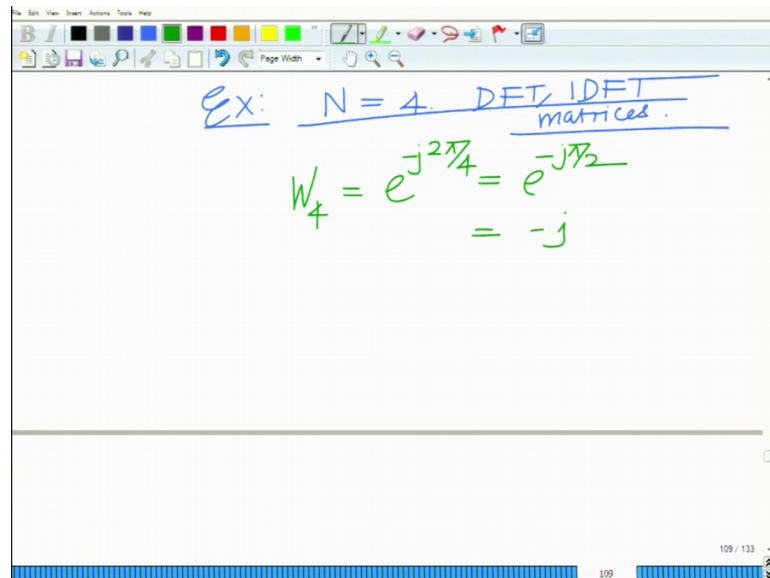

N x N Identity Matrix

$$W^{-1} = \frac{1}{N} W^H$$

$$= \frac{1}{N} W^*$$

And this is your property number 4 that is; $W^H W$ is N times identity matrix. Ok. This is an N cross N identity matrix. Ok. This is an N cross N identity matrix. Ok. So, basically you can also say, W^{-1} equals 1 over N W^H , which is also basically 1 over N W^* because, W^H is W^* the transpose of itself. So, this is 1 over N W^* . There is also another way to say the same relation.

(Refer Slide Time: 24:04)

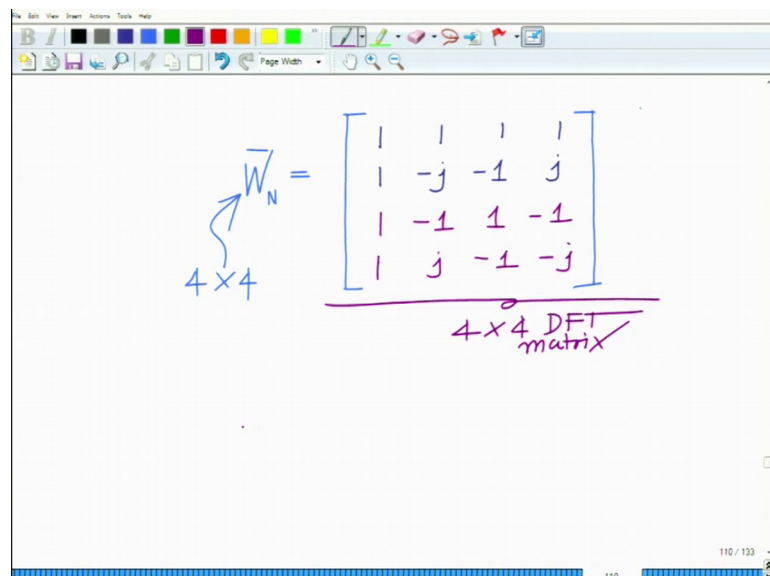

Ex: $N = 4$. DFT, IDFT matrices.

$$W_4 = e^{j2\pi/4} = e^{-j\pi/2} = -j$$

Now, what we want to do is? We want to write, what the DFT and IDFT matrices look. N equal to 4 DFT comma IDFT matrices that is; to get a better idea. What we want to do is? We want to write do a simple example, where we write the DFT and IDFT matrices for N is equal to 4. That is the length of sequence n equal to 4.

Now, realize that when N equal to 4, we have the W_4 which is equal to e raised to $j 2 \pi$ over e raised to minus $j 2 \pi$ over N e raised to minus $j 2 \pi$ over 4 that is e raised to minus $j \pi$ over 2 that is minus j , ok.

(Refer Slide Time: 24:53)

$W_N =$

$$\begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & -j & -1 & j \\ 1 & -1 & 1 & -1 \\ 1 & j & -1 & -j \end{bmatrix}$$

4x4 DFT matrix

And now, if you look at this; if you look at W_N , so the matrix just to distinguish this matrix I am going to write it as the \tilde{W}_N , to distinguish that this is a matrix because, W_N we are using it for the coefficient. This will be first, this will be N cross N , this will be 4 cross 4 matrix. So this will be a 4 cross 4 matrix and the elements are going to be, first elements are all ones, as we have seen. 1 this is W_N , raised to 1 that is $\text{minus } j$ W_N raised to the second 2 cross 2 element will be W_N square that is; $\text{minus } j$ square that is; $\text{minus } 1$ third element will be W_N cube that is; $\text{minus } j$ cube $\text{minus } j$ cube. You can see that will be $\text{minus } 1$ into $\text{minus } j$, so that will be j .

Similarly, this element a third row will be, 1 again, remember this is transpose symmetric, so I can just write it without looking at it. So, this is going to be $\text{minus } 1$, this element will be W_N raised to 4 . So, this will be $\text{minus } j$ raised to 4 , though that will be 1 and again, this element will be W_N raised to, I think, if I am not mistaken, W_N this is k equal to 2 N equal to this k equal to 2 N equal to 3 . So, W_N raised to 6 that will be $\text{minus } 1$, ok. And the last row, again you can write it by transpose symmetry, this element will be j because, remember this is the 4 comma 2 element, that will be same as 2 comma 4 element. This element is 4 comma 3 , that will be the same as 3 comma 4 and this element, last element is W_N raised to N minus 1 square.

(Refer Slide Time: 27:11)

$$\tilde{W}_N = \frac{1}{4} \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & j & -1 & -j \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \end{bmatrix}$$

4x4 IDFT matrix

$$\tilde{W}_N = \frac{1}{N} W_N^*$$

$$\tilde{W}_N \tilde{W}_N^H = I$$

So, that will be W_N raised to the power of 9 . So, you can see that will be $\text{minus } j$. You can check this, ok. So, this is basically, your 4 cross 4 DFT matrix. Now the IDFT

matrix, in fact; here N is equal to 4. Let me call this W_N tilde W_N you can write this as $1/4$ and remember to do the IDFT matrix, I don't need to go through the entire computation once again. I can just consider the conjugate of the DFT matrix that gives me the IDFT matrix, ok. So, that is very simple. So, the IDFT matrix is indeed. Once you have the DFT matrix, the IDFT matrix itself is very simple. So, that will be $1 \ 1 \ 1 \ 1$ second row take the conjugate of each element, minus j conjugate is j minus 1 conjugate is 1 minus 1 conjugate is 1 minus 1 conjugate is 1 minus 1 conjugate is 1 minus 1 conjugate is 1 .

Last row will be $1 \ j$ conjugate will be $1 \ -j$ minus 1 conjugate is 1 and minus j conjugate is j . And this will be your 4×4 IDFT matrix. And where we have use the property, W_N tilde equals $1/N$ W_N conjugate. In this case, specifically N is equal to N is equal to 4. And now, you can also verify that and this is something that you can do by yourself, you can enter it into MATLAB and you can verify that W_N tilde into W_N is, in fact; identity and you can also check that W_N Hermitian into W_N or W_N bar N rather. These are all W_N bar and these are the matrices, W_N bar N Hermitian into W_N bar N .

(Refer Slide Time: 29:14)

The image shows a whiteboard with handwritten mathematical content. At the top, it defines the 4×4 IDFT matrix as W_N tilde, with a value of $1/4$ indicated. The matrix is written as:

$$\frac{1}{4} \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & -1 & 1 & -1 \\ 1 & -j & -1 & j \\ 1 & j & -1 & -j \end{bmatrix}$$

Below the matrix, the following properties are listed:

$$\tilde{W}_N = \frac{1}{N} W_N^*$$

$$\tilde{W}_N \bar{W}_N = I$$

$$\tilde{W}_N^H \bar{W}_N = N I_{N \times N}$$

At the bottom, a green note says: "H.W. Verify these Properties."

Remember, we said W_N bar W_N bar and Hermitian W_N bar N this is equal to N times identity. So, you can check these things, you can verify this N times N cross N identity matrix. So, you can verify these properties. So, you can do this as homework, you can

enter this into MATLAB. MATLAB uses a very convenient interface to enter matrices, so you can quickly enter these matrices and verify this property.

So, this is; this in this module we have dealt with an important aspect that is, representing this IDFT and DFT operations as matrices. And, this is a very important I would like to say tool, because it allows us to represent these operations as a linear transforms. And therefore, look at these as matrices and use these tools to carry out these operations in analysis, right?

So, representing the signals and outputs as vectors and representing these DFT and ID IDFT operations as matrices and that helps us significantly simplify a analysis and represent it in a much more compact and sort of intuitive fashion, alright?

So, we will stop here and continue in the subsequent modules.

Thank you very much.
