**Properties of Norm, Gaussian Elimination, Echelon form of matrix**

Hello. Welcome to another module in this massive open online course. So, you are looking at the concept of inner product and its various properties. In particular, we have also looked at the Cauchy-Schwarz inequality all right.

(Refer Slide Time: 00:25)

So, what we are looking at is basically this concept of the inner product, the notion of an inner product and the various properties of the inner product. And in particular, we have looked at the Cauchy-Schwarz inequality which states that you have the inner product of two vectors  $u$  and  $v$  that is less than or equal to the norm of  $u$  times the norm of  $v$ .

(Refer Slide Time: 01:36)

PROPERTIES

Cauchy-Schwarz inequality

$$\langle \bar{u}, \bar{v} \rangle \leq \|\bar{u}\| \cdot \|\bar{v}\|$$
$$\langle \bar{u} + t\bar{v}, \bar{u} + t\bar{v} \rangle \geq 0$$
$$\Rightarrow b^2 - 4ac \leq 0$$
$$\Rightarrow 4\langle \bar{u}, \bar{v} \rangle^2 - 4\langle \bar{u}, \bar{u} \rangle \langle \bar{v}, \bar{v} \rangle \leq 0$$

71 / 125

And in fact, in the derivation of the Cauchy-Schwarz inequality, what you have seen is that we have employed the property that the discriminant that is we have looked at  $\bar{u}$  bar plus the inner product of  $\bar{u}$  bar plus  $t$   $\bar{v}$  bar with itself and we have said that this inner product, this is always greater than or equal to 0. This implies quadratic in  $t$  is greater than or equal to 0 which implies the discriminant has to be less than or equal to 0. And which implies that the discriminant is nothing but  $4 \bar{u}$  bar comma  $\bar{v}$  bar square minus  $4 \bar{u}$  bar comma  $\bar{u}$  bar times  $\bar{v}$  bar comma  $\bar{v}$  bar, this is less than or equal to 0.

(Refer Slide Time: 02:34)

If  $b^2 - 4ac = 0$

$\Rightarrow$  Quadratic equation in  $t$  has a unique root  $\tilde{t}$

$\Rightarrow \langle \bar{u} + \tilde{t}\bar{v}, \bar{u} + \tilde{t}\bar{v} \rangle = 0$

$\Rightarrow \bar{u} + \tilde{t}\bar{v} = 0$

$\Rightarrow \bar{u} = -\frac{\tilde{t}}{k}\bar{v}$

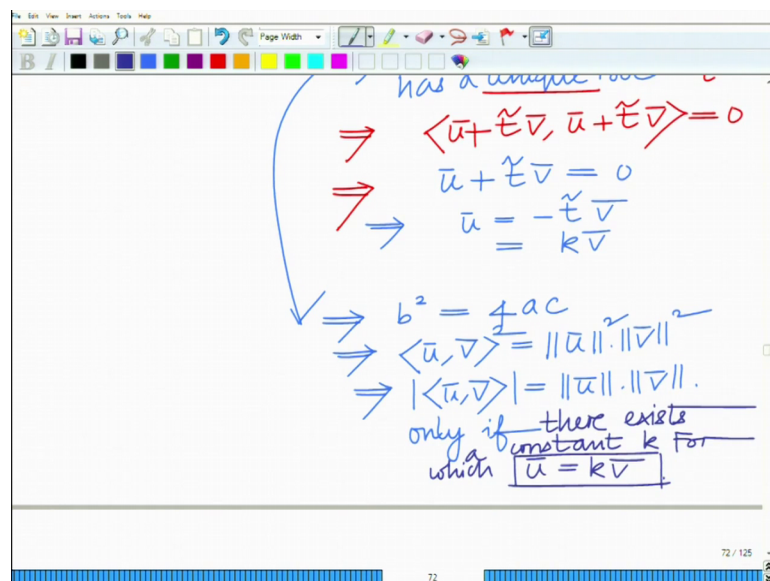

72 / 125

In fact, if the discriminant is 0, all right that is  $b^2 - 4ac = 0$ , this means that the quadratic equation has a unique root.

Now, if this is the discriminant, if the discriminant equals 0, this implies the quadratic equation. Remember, the quadratic equation in  $t$  has a unique root which implies that at that root you will have let us call that let us denote that by let us say  $\tilde{t}$  ok. So, at that value of  $\tilde{t}$ , we will have  $\bar{u} + \tilde{t}\bar{v}$ ,  $\bar{u} + \tilde{t}\bar{v}$ , this inner product is 0. All right at that root because the quadratic is nothing but the inner product of  $\bar{u} + \tilde{t}\bar{v}$  with itself ok. So, at that value of  $\tilde{t}$  this inner product vanishes and we know that the inner product  $\bar{u}$  between of any vector with itself vanishes only if the vector is 0.

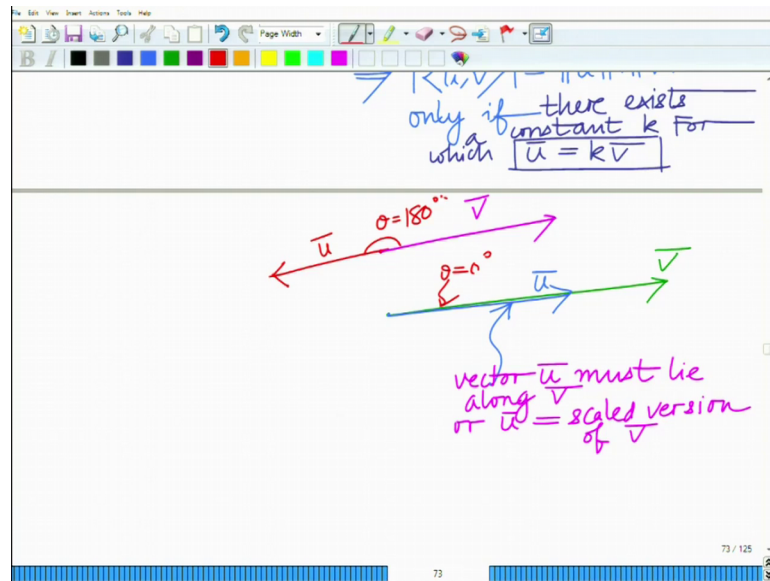

So, this implies that this is possible only if  $\bar{u} + \tilde{t}\bar{v} = 0$  which implies  $\bar{u} = -\tilde{t}\bar{v}$ . For some  $\tilde{t}$ , you can denote it as some  $k$  constant  $k$  times  $\bar{v}$ .

(Refer Slide Time: 04:20)

So, this shows that we have what this means is be sure that  $b^2 - 4ac = 0$ , this implies  $b^2 = 4ac$ , this implies, inner product of  $\bar{u}$  comma  $\bar{v}$  equals that is  $\bar{u}$  comma  $\bar{v}$  square equals norm  $\bar{u}$  into norm  $\bar{v}$  square. Or this implies magnitude of  $\bar{u}$  comma  $\bar{v}$  equals norm  $\bar{u}$  into norm  $\bar{v}$  only if there exists a  $k$ , that is determinant is 0 only if there exists a constant  $k$  for which  $\bar{u} = k\bar{v}$ .

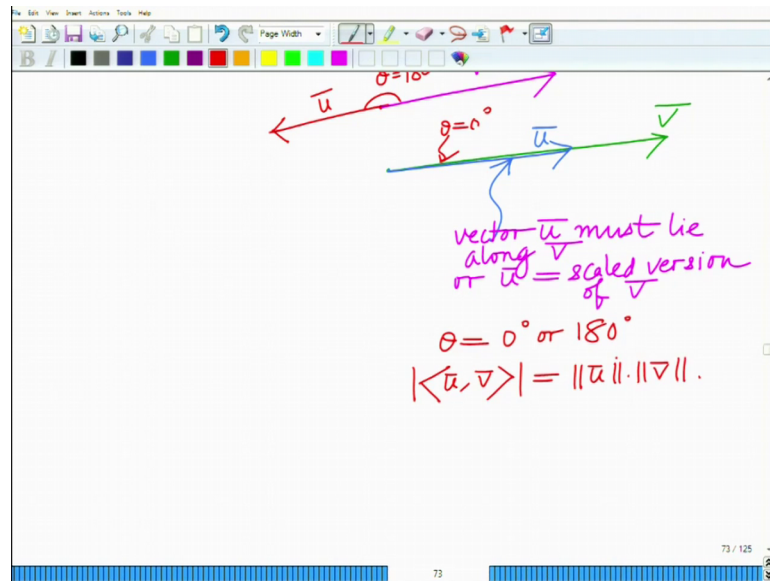

(Refer Slide Time: 05:34)

So, the inner product that is the magnitude of the inner product is equal to the product of the norms of the two vectors only if the vector  $\vec{u}$  is a constant times bigger. What this means basically is that if we have a vector  $\vec{v}$ , then the vector  $\vec{u}$  must be  $k$  times  $\vec{v}$  which means that the vector  $\vec{u}$  must also lie along  $\vec{v}$ . So, this implies that the vector  $\vec{u}$  must lie along  $\vec{v}$  or  $\vec{u}$  equals scaled. That is simply a scaled version of  $\vec{v}$ , ok. So, the inner product between two vectors, magnitude of the inner product between two vectors equals the product of the norms only if  $\vec{u}$  lies along  $\vec{v}$  or  $\vec{u}$  can also be exactly opposite the direction of  $\vec{v}$ . In fact, because we are looking simply at the magnitude, you can also have  $\vec{v}$  and  $\vec{u}$ , ok. So which means either the angle equal to  $\theta = 0^\circ$  or  $\theta = 180^\circ$ , ok.

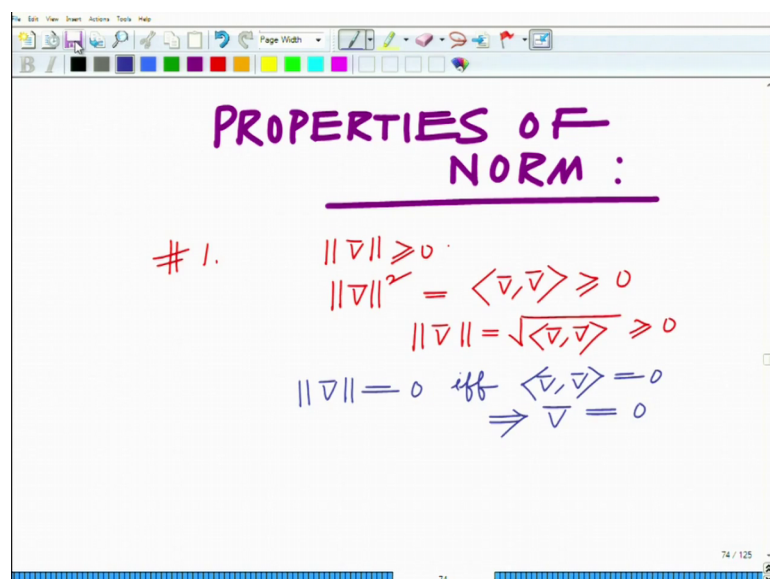

(Refer Slide Time: 07:05)

So, in both the cases that is theta equal to 0 degrees or 180 degrees, we will have magnitude  $\|\vec{u}\| \|\vec{v}\| = \|\vec{u}\| \|\vec{v}\|$ . Of course, if theta equals 180 degrees the inner product between  $\vec{u}$  and  $\vec{v}$  is negative, so  $\|\vec{u}\| \|\vec{v}\| = -\langle \vec{u}, \vec{v} \rangle$  that is an inner product between  $\vec{u}$  and  $\vec{v}$  is minus  $\|\vec{u}\| \|\vec{v}\|$  and if theta equals 0 degrees, then the inner product is  $\|\vec{u}\| \|\vec{v}\|$  simply  $\|\vec{u}\| \|\vec{v}\|$  ok. So, they have to be for the inner; so, magnitude of the inner product to equal to the product of the norms, these vectors have to be either aligned or exactly anti aligned or that is an angle between them is 180 degrees ok.

(Refer Slide Time: 08:06)

And this is an interesting property that is related to the inner product which we will again frequently invoke at instances during our discussion on optimization. Let us now look at another important concept that is a various properties. So, what we want to look at is the properties of this norm, the properties of the norm and these are as follows. The first property will be that norm  $v$  bar is greater than or equal to 0. In fact, norm  $v$  bar this is in fact, norm  $v$  bar square equals  $v$  bar the inner product of  $v$  bar comma  $v$  bar which is greater than or equal to 0.

And norm  $v$  bar equals square root of the inner product between  $v$  bar and  $v$  bar which is also greater than equal to 0. In fact, norm  $v$  bar equal to 0 if and only if, the inner product  $v$  bar between  $v$  bar and itself equal to 0 which implies we have seen inner product is 0 only in only the inner product of  $v$  bar with itself is 0 only when  $v$  bar is 0.

(Refer Slide Time: 09:45)

The image shows a whiteboard with handwritten mathematical derivations. At the top, there is a toolbar with various icons. The main content is as follows:

$$\Rightarrow \nabla = 0$$

$$\#2 \quad \|c\nabla\| = |c| \cdot \|\nabla\|$$

$$\|c\nabla\|^2 = \langle c\nabla, c\nabla \rangle = c \langle \nabla, c\nabla \rangle$$

$$= c^2 \langle \nabla, \nabla \rangle$$

$$= c^2 \|\nabla\|^2$$

$$\Rightarrow \boxed{\|c\nabla\| = |c| \cdot \|\nabla\|}$$

At the bottom right of the whiteboard, there is a small text "75 / 125".

Now, the second aspect is that the norm of  $c$   $v$  bar, the constant times  $v$  bar equals the magnitude of the constant times the norm of  $v$  bar. In fact, you can see the norm of  $c$   $v$  bar square equals  $c$   $v$  bar,  $c$   $v$  bar which is  $c$  times inner product of  $v$  bar with  $c$   $v$  bar which is  $c$  square times the inner product of  $v$  bar with itself which is  $c$  square times the norm of  $v$  bar square which implies the norm of  $c$   $v$  bar equals taking the square root of on the right, you have magnitude of  $c$  times norm of  $v$  bar, it was norm of  $v$  bar ok.

(Refer Slide Time: 10:51)

The image shows a handwritten derivation of the triangle inequality for vector norms. At the top, there is a green arrow pointing to the equation  $\|c\mathbf{v}\| = |c| \cdot \|\mathbf{v}\|$ . Below this, the text "#3. TRIANGLE INEQUALITY:" is written in purple. The main derivation is as follows:

$$\begin{aligned} \|\mathbf{u} + \mathbf{v}\| &\leq \|\mathbf{u}\| + \|\mathbf{v}\| \\ \|\mathbf{u} + \mathbf{v}\|^2 &= \langle \mathbf{u} + \mathbf{v}, \mathbf{u} + \mathbf{v} \rangle \\ &= \langle \mathbf{u}, \mathbf{u} + \mathbf{v} \rangle + \langle \mathbf{v}, \mathbf{u} + \mathbf{v} \rangle \\ &= \langle \mathbf{u}, \mathbf{u} \rangle + \langle \mathbf{u}, \mathbf{v} \rangle \\ &\quad + \langle \mathbf{v}, \mathbf{u} \rangle + \langle \mathbf{v}, \mathbf{v} \rangle \end{aligned}$$

The slide also features a toolbar at the top with various drawing tools and a status bar at the bottom indicating "75 / 125".

And the third property is the important property. This is known as the triangle inequality. And the triangle inequality, this states that norm  $\mathbf{u}$  bar plus  $\mathbf{v}$  bar less than or equal to norm  $\mathbf{u}$  bar plus norm  $\mathbf{v}$  bar and this follows as follows, this can be seen as follows if you look at norm  $\mathbf{u}$  bar plus  $\mathbf{v}$  bar square that is the inner product of  $\mathbf{u}$  bar plus  $\mathbf{v}$  bar with itself which is basically again  $\mathbf{u}$  bar, inner product with  $\mathbf{u}$  bar plus  $\mathbf{v}$  bar plus  $\mathbf{v}$  bar, inner product with  $\mathbf{u}$  bar plus  $\mathbf{v}$  bar which is equal to  $\mathbf{u}$  bar inner product with  $\mathbf{u}$  bar plus  $\mathbf{u}$  bar inner product with  $\mathbf{v}$  bar plus  $\mathbf{v}$  bar inner product with  $\mathbf{u}$  bar plus  $\mathbf{v}$  bar inner product with  $\mathbf{v}$  bar equals, well norm  $\mathbf{u}$  bar square plus twice inner product between  $\mathbf{u}$  bar and  $\mathbf{v}$  bar because inner product  $\mathbf{v}$  bar  $\mathbf{u}$  bar is the same as inner product  $\mathbf{u}$  bar  $\mathbf{v}$  bar plus norm  $\mathbf{v}$  bar square.

(Refer Slide Time: 12:21)

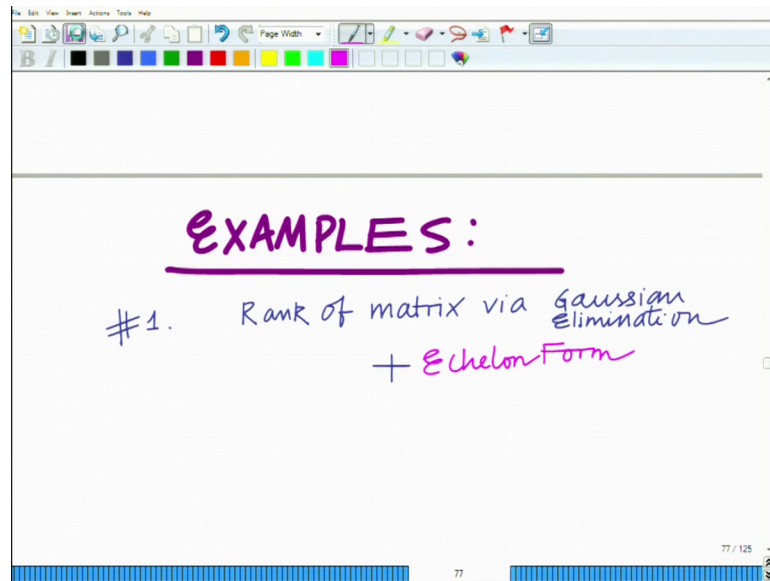

The image shows a handwritten derivation on a whiteboard. The derivation starts with the expansion of the squared norm of the sum of two vectors,  $\|u+v\|^2$ . It uses the properties of inner products to show that  $\|u+v\|^2 = \|u\|^2 + 2\langle u, v \rangle + \|v\|^2$ . Then, it applies the Cauchy-Schwarz inequality to bound the inner product term, resulting in  $\|u+v\|^2 \leq \|u\|^2 + 2\|u\|\|v\| + \|v\|^2$ . This is then simplified to  $\|u+v\|^2 \leq (\|u\| + \|v\|)^2$ . Finally, taking the square root of both sides yields the triangle inequality:  $\|u+v\| \leq \|u\| + \|v\|$ . The final result is enclosed in a purple box.

$$\begin{aligned} & + \langle v, u \rangle + \langle v, v \rangle \\ = & \|u\|^2 + 2\langle u, v \rangle + \|v\|^2 \\ \leq & \|u\|^2 + 2\|u\|\|v\| + \|v\|^2 \\ = & (\|u\| + \|v\|)^2 \\ \Rightarrow & \boxed{\|u+v\| \leq \|u\| + \|v\|} \end{aligned}$$

Now, applying the Cauchy-Schwarz inequality, we know that the inner product of  $u$  and  $v$  is less than the product of the norms  $\|u\|$  and  $\|v\|$ . So, this is less than or equal to  $\|u\|^2 + 2\|u\|\|v\| + \|v\|^2$  which is equal to  $(\|u\| + \|v\|)^2$ . And therefore, we have this implies taking the square root since all the quantities are positive, this implies  $\|u+v\| \leq \|u\| + \|v\|$ . This is basically the triangle inequality of the norm. This is valid for any norm that is induced by the inner product, ok.

So, that basically concludes our discussion on the various aspects of the norm and the properties of the norm that is induced by the inner product. So, now, let us start doing some examples on this mathematical preliminaries. So, what we want to do is, we want to do some examples on this mathematical preliminaries.

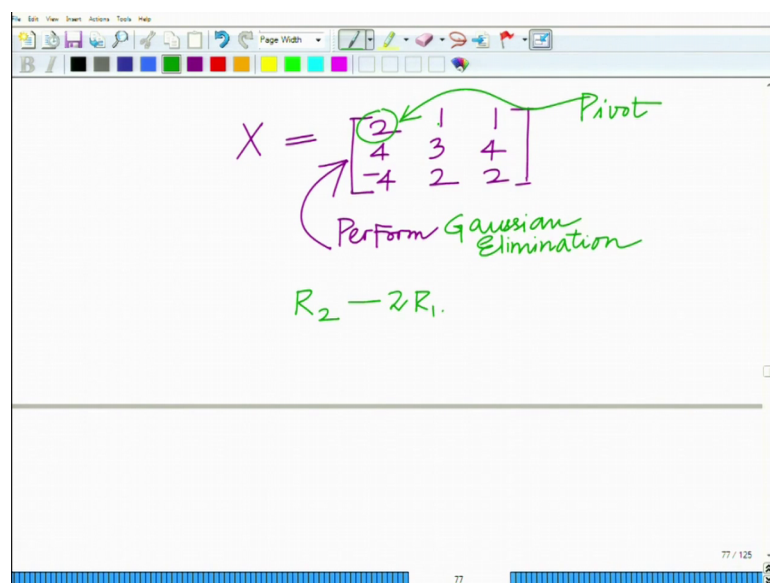

(Refer Slide Time: 14:04)

For instance, let us start by considering a simple example. It is an important aspect of matrices that we have not discussed previously which is the row elimination that is a reduction to the row, what is known as the row echelon form or simply the echelon form

So, in this example, what we will want to do is the rank of matrix via Gaussian elimination. So, we have seen the concept of a rank of a matrix and the echelon form and we want to also discuss this notion of an of an echelon form.

(Refer Slide Time: 15:19)

So, we have  $x$  let us say, we have a 3 cross 3 matrix, 2, 4, minus 4, 1, 3, 2 and 1, 4, 2. So, what we are going to do is we are going to perform row operations on this. So, what first thing we are going to, we are going to perform Gaussian elimination.

So, first perform  $R_2$  that is row 2 minus twice row 1. So, what we are doing is basically, we are using this element as a pivot as what is known as a pivot and we are subtracting this to reduce a corresponding elements in the second row, we are multiplying the first row all right the pivot all right, we are multiplying it, we are multiplying the first row, scaling it appropriately, subtracting it from the second row so as to reduce the corresponding element in the second row to the element below the pivot in the second row to 0.

(Refer Slide Time: 16:26)

The image shows a whiteboard with handwritten mathematical work. At the top, there is a 3x3 matrix:
$$\equiv \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 2 \\ -4 & 2 & 2 \end{bmatrix}$$
The element '0' in the second row, first column is circled in red. A red arrow points from the circled '0' to the '1' in the first row, second column. To the right of the matrix, there is a red note: "Reduced Element below pivot to zero." Below the matrix, the text "Perform  $R_3 + 2R_1$ " is written in red. Underneath that, the resulting matrix is shown:
$$X \equiv \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 2 \\ 0 & 4 & 4 \end{bmatrix}$$
The whiteboard interface includes a toolbar at the top with various drawing tools and a status bar at the bottom showing "78 / 125".

So, this will give you an equivalent representation that is when you multiply 4. So, the first row will remain as it is so, that is 2, 1, 1; the second row will be 0, 1, 2; third row will be minus 4, 2, 2. So, we have reduced this element below the pivot; reduce the element below the pivot to 0 ok. Now, similarly you can also reduce this to 0 by performing  $R_3 + 2R_1$ . So, we want to perform  $R_3 + 2R_1$  and that will give you  $x$  equals the first row will remain as it is. Second row will give 0, 1, 2 and the third row will be minus 4, plus 4 that is 0, 2 plus 2, that is 4, 2 plus 2, that is 4.

(Refer Slide Time: 18:21)

Perform  $R_3 + 2R_1$

$$X \equiv \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 2 \\ 0 & 4 & 4 \end{bmatrix}$$

Pivot

entries below each column in pivot = 0.

$$R_3 - 4R_1$$

78 / 125

So, what we have done is we have chosen the pivot and we have reduced all the corresponding entries in each column below the pivot to 0 ok. And now, similarly we can use this as a pivot and we can again perform  $R_3 - 4R_1$ , now.

(Refer Slide Time: 19:02)

$$\equiv \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 2 \\ 0 & 0 & -4 \end{bmatrix}$$

Pivots

Below each pivot = column of zeros.

3 non zero pivots.

Upper Triangular matrix = "ECHELON" Form of matrix

79 / 125

And that equivalently yields the first rows as it is. Second row is also as it is and third will become 0, 0 and 4 minus 8, that is minus 4 and if you look at this now, what you will observe is that this is an upper triangular matrix. If you look at this, this is an upper triangular matrix.

And this is termed as the echelon form of the matrix. This is termed as Echelon form of the matrix and these are the pivots, these are your pivots which are used to scale and subtract from the rows below. These are the pivots and below each pivot, you have a column of zeros below each pivot equals, below each pivot you have a column of zeros. And the interesting property here is if you look at the number of nonzero rows, the number of nonzero, in this case you have 3 nonzero rows and the number of nonzero rows is equal to the rank of the matrix.

(Refer Slide Time: 20:58)

Number of non-zero rows  
= Rank of matrix

$$X = \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 5 \\ 3 & 6 & 1 \end{bmatrix}$$

This is an interesting number the number of nonzero rows equals the rank of the matrix and this is basically the interesting. So, one this is how one can see the rank by the, this is how one can deduce the rank of the matrix why are this pivoting and this process of Gaussian elimination during using the pivots and subtracting the scaled versions, the this scaled versions of the rows from the rows beneath ok. Let us now consider another matrix. Consider another example let us consider again a matrix X equals 1, 2, 1 and 2, 4, 5, 3, 6, 1.

(Refer Slide Time: 22:13)

A screenshot of a whiteboard showing the following handwritten work:

$$X = \begin{bmatrix} 1 & 2 & \frac{1}{3} \\ 2 & 4 & \frac{1}{5} \\ 3 & 6 & 1 \end{bmatrix}$$
$$R_2 - 2R_1$$
$$\equiv \begin{bmatrix} 1 & 2 & \frac{1}{3} \\ 0 & 0 & \frac{1}{5} \\ 3 & 6 & 1 \end{bmatrix}$$

The word "Pivot" is written in yellow above the second column of the second matrix, with a yellow arrow pointing to the element 2 in the first row, second column.

$$R_3 - 3R_1$$
$$=$$

And if you look at this, you will have now perform  $R_2 - 2R_1$ , that will give you the matrix 1, 2, 1, 0, 4, 5, 3, 6, 1. So, you have this as your pivot. Now perform,  $R_3 - 3R_1$  and that gives you well, you can see what that gives you.

(Refer Slide Time: 22:54)

A screenshot of a whiteboard showing the following handwritten work:

$$\equiv \begin{bmatrix} 1 & 2 & \frac{1}{3} \\ 0 & 0 & \frac{1}{5} \\ 3 & 6 & 1 \end{bmatrix}$$

The word "Pivot" is written in yellow above the second column of the second matrix, with a yellow arrow pointing to the element 2 in the first row, second column.

$$R_3 - 3R_1$$
$$= \begin{bmatrix} 1 & 2 & \frac{1}{3} \\ 0 & 0 & \frac{1}{5} \\ 0 & 0 & -2 \end{bmatrix}$$

That gives you this is 0 and this is 5 minus 2, this is 3. So, this is 0, 0, 3 and now you will have  $R_3 - 3R_1$ , this is 0, 0 and this is 1 minus 3, this is minus 2. And now, you can interestingly see that all the pivots possible pivots in the second column are also 0.

(Refer Slide Time: 23:49)

$$= \begin{bmatrix} 1 & 2 & \frac{1}{3} \\ 0 & 0 & 3 \\ 0 & 0 & -2 \end{bmatrix}$$

zeros

$$R_3 + \frac{2}{3}R_2$$
$$\equiv \begin{bmatrix} 1 & 2 & \frac{1}{3} \\ 0 & 0 & 3 \\ 0 & 0 & 0 \end{bmatrix}$$

So, these entries which can be used as possible pivots, these are zeros. And now what we do is we perform,  $R_3 + \frac{2}{3}R_2$  and that gives us something interesting what you will see is you have 1, 2, 1, 0, 0, 3 and you will finally have a row of all 0s. So, this is a row

(Refer Slide Time: 24:22)

$$R_3 + \frac{2}{3}R_2$$
$$\equiv \begin{bmatrix} 1 & 2 & \frac{1}{3} \\ 0 & 0 & 3 \\ 0 & 0 & 0 \end{bmatrix}$$

Num of nonzero rows = 2

Echelon Form of matrix.

All zero row

Rank of matrix = 2

Obtained via Gaussian elimination

Each pivot lies to right of pivot in row above

Pivots

So this, in this Echelon form, you will see you have a row, all 0 row. So, this is an all zero row. So, number of nonzero rows, nonzero equal to 2 and implies the rank, rank of matrix equal to 2 ok.

And in this case, the pivots you can clearly see the pivots that we have used these are the pivots. So, 1 and 3, these are the pivots and note this interesting property of the pivots that each pivot has to lie of the right of the pivot in the row above. So, each pivot each pivot lies to the right of pivot in the row, in the row above. And therefore, the rank of the matrix is 2 and this is obtained via Gaussian elimination, obtained as obtained via.

And this is the Echelon form of this matrix. This is a Echelon form of this matrix and this is how the simple procedure of Gaussian elimination using pivoting can be used to determine the rank of the matrix and reduce it to the Echelon form and this is also very helpful makes it much easier to solve a system of linear equations. We will stop here.

Thank you very much.
