

Power System Analysis
Prof. A. K. Sinha
Department of Electrical Engineering
Indian Institute of Technology, Kharagpur

Lecture - 19
Power Flow – IV

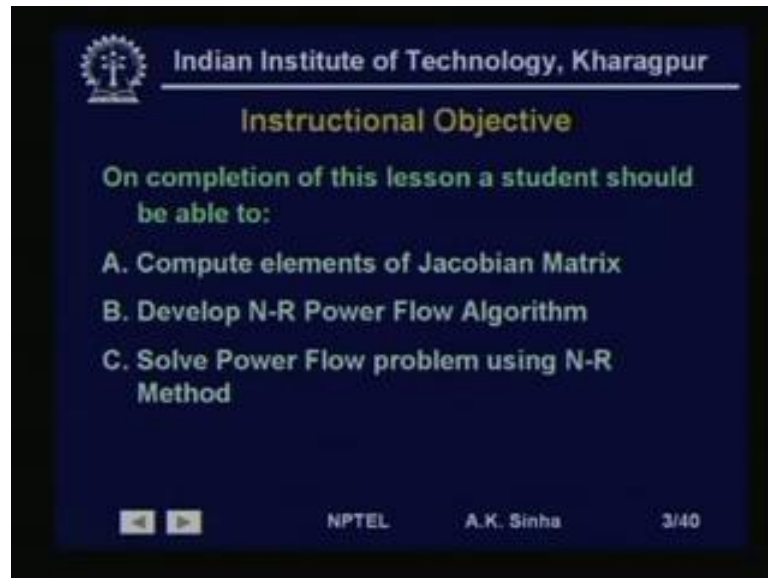

Welcome to lesson 19 on Power System Analysis. In this lesson, we will continue with Power Flow analysis.

(Refer Slide Time: 01:03)

In this lesson, we will talk about the computation of Jacobian matrix for Newton Raphson method. And we will talk about the computational algorithm for Newton Raphson power flow. And we will work out one example for a small power system, how we, do a Newton Raphson load flow or power flow.

(Refer Slide Time: 01:24)

Indian Institute of Technology, Kharagpur

Instructional Objective

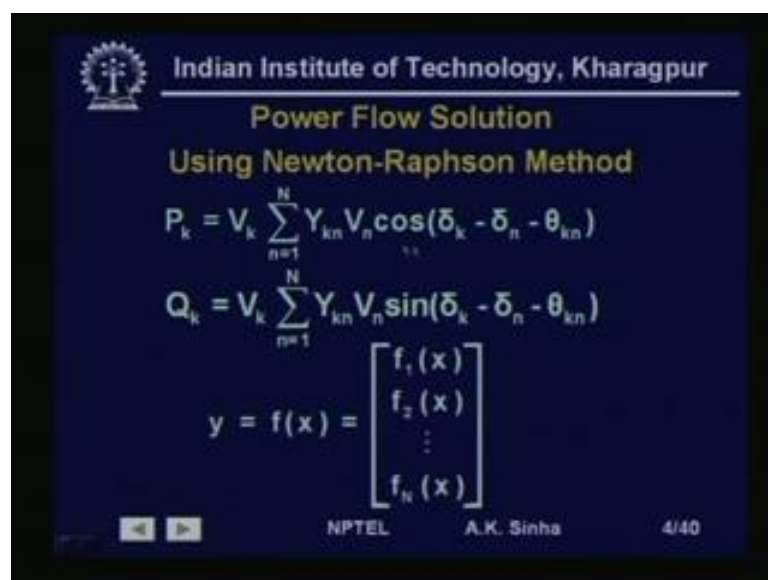

On completion of this lesson a student should be able to:

- A. Compute elements of Jacobian Matrix
- B. Develop N-R Power Flow Algorithm
- C. Solve Power Flow problem using N-R Method

NPTEL A.K. Sinha 3/40

Well, once you complete this lesson, you will be able to compute the elements of the Jacobian matrix. You will be able to develop the Newton Raphson power flow algorithm and solve power flow problems using Newton Raphson method. Before, we go into the computation of Jacobian matrix elements; we will recapitulate some of the equations. For the, that we developed for the Newton Raphson load flow or power flow.

(Refer Slide Time: 02:06)

Indian Institute of Technology, Kharagpur

**Power Flow Solution
Using Newton-Raphson Method**

$$P_k = V_k \sum_{n=1}^N Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$
$$Q_k = V_k \sum_{n=1}^N Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$$
$$y = f(x) = \begin{bmatrix} f_1(x) \\ f_2(x) \\ \vdots \\ f_n(x) \end{bmatrix}$$

NPTEL A.K. Sinha 4/40

Well, as we had seen in the last lesson, the power flow equations. In terms of real and reactive power injections, at any bus k is given by these relationships. So, which is a

function of voltage magnitude at all the buses and the voltage angle at all the buses, as well as the admittance, magnitude and angle for the transmission network. Same, is true for the reactive power, the equations can be return as shown here.

We can write this, as a function of x as y is equal to f x, where for each bus, we will be writing these two equations. So, if there are number of buses, then we will write all these equations as f 1 x up to f n x, total number of equations required.

(Refer Slide Time: 03:17)

Indian Institute of Technology, Kharagpur

Where

$$y = \begin{bmatrix} P \\ Q \end{bmatrix} = \begin{bmatrix} P_2 \\ \vdots \\ P_N \\ Q_2 \\ \vdots \\ Q_N \end{bmatrix}; \quad x = \begin{bmatrix} \delta \\ V \end{bmatrix} = \begin{bmatrix} \delta_2 \\ \vdots \\ \delta_n \\ V_2 \\ \vdots \\ V_n \end{bmatrix}$$

NPTEL A.K. Sinha 5/40

Where, y is basically a vector of real power injections P and reactive power injections Q. Here, we have assumed that bus 1 is a slack bus for our purpose. So, for slack bus, since we know the voltage magnitude and angle, we do not have any real power or reactive power specified. So, we do not have any P 1 and Q 1 in this vector of y. So, we have P 2 to P n and Q 2 to Q n, the unknown vector or the state vector as given by the voltage phase angle delta.

And we again, this delta S for all the buses, except the slack bus for which we already know the angle, as we said earlier, we since the slack bus, can be taken as a reference. So, delta 1 is normally taken as 0 degrees and. So, we have from delta 2 to delta n, the voltage angles and V 2 to V n, the voltage magnitude for all the buses, except the slack bus.

(Refer Slide Time: 04:37)

Indian Institute of Technology, Kharagpur

$$f(x) = \begin{bmatrix} P(x) \\ Q(x) \end{bmatrix} = \begin{bmatrix} P_2(x) \\ \vdots \\ P_N(x) \\ Q_2(x) \\ \vdots \\ Q_N(x) \end{bmatrix}$$

NPTEL A.K. Sinha 6/40

This can be written as $f(x)$ is equal to $P(x)$, $Q(x)$ in terms of P_2 , which is the function of x up to P_N and Q_2 which is the function of x , Q which is the function of x , from Q_2 to Q_N . This we have already seen. So, I am not going in details of this.

(Refer Slide Time: 04:54)

Indian Institute of Technology, Kharagpur

$$y_k = P_k = P_k(x)$$

$$= V_k \sum_{n=1}^N Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$

$$y_{k+N} = Q_k = Q_k(x)$$

$$= V_k \sum_{n=1}^N Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$$

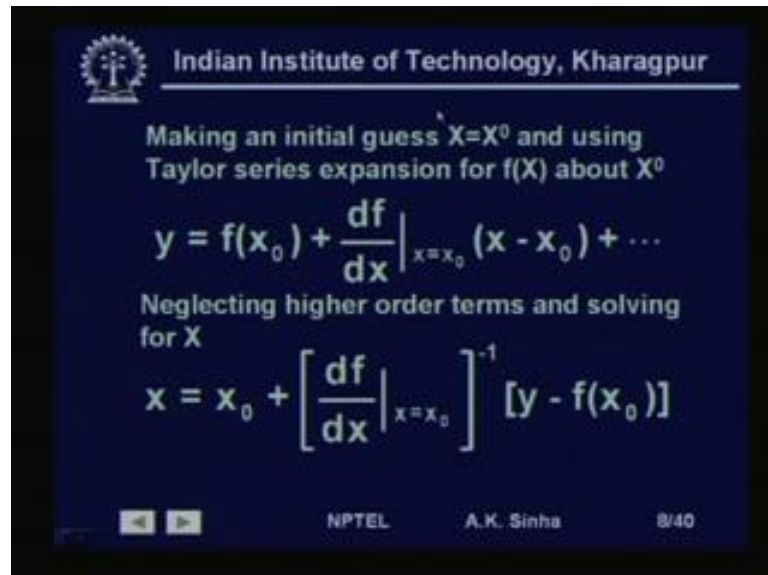

$$k = 2, 3, \dots, N$$

NPTEL A.K. Sinha 7/40

So, for any particular bus, we can write the equation y_k is equal to P_k , which is P_k a function of x . In this term and we can arrange all the reactive power injections from k plus N to k plus. This will be equal to $2N$ basically. So, k is equal to 2 to N will be the first

equations, first $N - 1$ equations and $N + 2$ to $2N$ will be the other $N - 1$ equations, for the reactive power. So, we have arranged our equations like this.

(Refer Slide Time: 05:51)

Indian Institute of Technology, Kharagpur

Making an initial guess $X = X_0$ and using Taylor series expansion for $f(X)$ about X_0

$$y = f(x_0) + \left. \frac{df}{dx} \right|_{x=x_0} (x - x_0) + \dots$$

Neglecting higher order terms and solving for X

$$x = x_0 + \left[\left. \frac{df}{dx} \right|_{x=x_0} \right]^{-1} [y - f(x_0)]$$

NPTEL A.K. Sinha 8/40

Now, making an initial guess of x at x_0 and using Taylor series expansion for $f(x)$ about x_0 . We can write y is equal to $f(x_0)$ plus $\left. \frac{df}{dx} \right|_{x=x_0} (x - x_0)$ plus higher order terms. Since, we are assuming that our guess is somewhat near to x . So, the higher order terms are going to be much smaller and they can be neglected. So, neglecting higher order terms and solving for x . We can write this equation as x is equal to x_0 plus $\left[\left. \frac{df}{dx} \right|_{x=x_0} \right]^{-1} [y - f(x_0)]$.

(Refer Slide Time: 06:39)

Indian Institute of Technology, Kharagpur

$$x^{(i+1)} = x^{(i)} + J^{-1(i)} \{y - f[x^{(i)}]\}$$

where

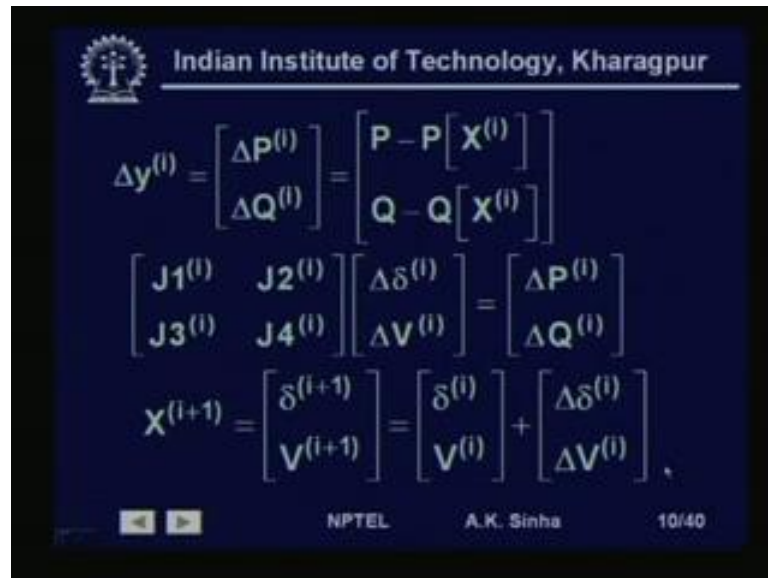

$$J^{(i)} = \left. \frac{df}{dx} \right|_{x=x^{(i)}} = \begin{bmatrix} \frac{\partial f_1}{\partial x_1} & \frac{\partial f_1}{\partial x_2} & \dots & \frac{\partial f_1}{\partial x_N} \\ \frac{\partial f_2}{\partial x_1} & \frac{\partial f_2}{\partial x_2} & \dots & \frac{\partial f_2}{\partial x_N} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial f_N}{\partial x_1} & \frac{\partial f_N}{\partial x_2} & \dots & \frac{\partial f_N}{\partial x_N} \end{bmatrix}_{x=x^{(i)}}$$

NPTEL A.K. Sinha 9/40

In and in an iterative term, the Newton Raphson power flow equations can be written in terms of x . At iteration i plus 1 is equal to x at iteration i plus J inverse at iteration i into Y minus $f(x)$ calculated at the x values at i th iteration. So, with this as an iterative form is the basic Newton Raphson algorithm. That we have for power flow solution, where J is basically the Jacobian matrix df/dx at x is equal to x_i .

That is what, we are doing is each equation, we are finding out the partial derivative of the equation with respect to x_1, x_2 up to x_n . And for each of these N equations, we have these partial derivatives. So, we will get a Jacobian matrix in this form, which is the first order partial derivative of f with respect to x at x is equal to x_i . That is the value of x at the i th iteration.

(Refer Slide Time: 07:55)

The slide displays the following equations for power flow analysis:

$$\Delta y^{(i)} = \begin{bmatrix} \Delta P^{(i)} \\ \Delta Q^{(i)} \end{bmatrix} = \begin{bmatrix} P - P[X^{(i)}] \\ Q - Q[X^{(i)}] \end{bmatrix}$$
$$\begin{bmatrix} J_1^{(i)} & J_2^{(i)} \\ J_3^{(i)} & J_4^{(i)} \end{bmatrix} \begin{bmatrix} \Delta \delta^{(i)} \\ \Delta V^{(i)} \end{bmatrix} = \begin{bmatrix} \Delta P^{(i)} \\ \Delta Q^{(i)} \end{bmatrix}$$
$$X^{(i+1)} = \begin{bmatrix} \delta^{(i+1)} \\ V^{(i+1)} \end{bmatrix} = \begin{bmatrix} \delta^{(i)} \\ V^{(i)} \end{bmatrix} + \begin{bmatrix} \Delta \delta^{(i)} \\ \Delta V^{(i)} \end{bmatrix}$$

At the bottom of the slide, there are navigation icons, the text "NPTEL A.K. Sinha", and the slide number "10/40".

For power flow term, we can write Δy_i is equal to ΔP_i and ΔQ_i . That is the change in real power and change in reactive power at i th iteration. This will be nothing but equal to the P value, which is specified at the buses minus P value, which is calculated with the state variable x are V and δ calculated at i th iteration. Same thing for Q , Q is specified value at that bus minus Q calculated with x at i th iteration.

These can be written as this Jacobian matrix J_1, J_2, J_3, J_4 . That is what, we have done is, we have divided the Jacobian matrix into four parts. J_1 is the part which relates ΔP with δ . J_2 will be is the part, which relates ΔP with ΔV . And J_3 , relates the part with ΔQ , where δ and J_4 relates the part ΔQ with ΔV . So, we have this Jacobian multiplied by this Δ , Δ into ΔV is equal to $\Delta P_i, \Delta Q_i$. So, this is the equation, now this value we know, using the iteration the value of the state variable at i th iteration.

So, what we need to do is, we need to solve for, the changes in the voltage phase angle and the voltage magnitude at i th iteration. Once, we calculate this, as we see this equation, this is a constant matrix, with the values computed for x at i . So, this constant matrix can be written as the matrix A and this is X . So, $A X = Y$ is the form and we have seen, how we can solve it using the gauss elimination method.

So, once, we solve for this X . That is $\Delta \delta$, ΔV at i th iteration. Then, we can find out the value of X , which is again same as δ , V at $i+1$ th

iteration. As equal to the value of delta and del and V at ith iteration plus the value of delta, delta at ith iteration and delta V at ith iteration.

So, this is, what we do. So, once, we have got this updated value, then again we calculate the mismatches delta P and delta Q, at i plus 1th iteration. So, again the Jacobian matrix at i plus 1th iteration and solve for this delta, delta and delta V at i plus 2 iteration and so on.

(Refer Slide Time: 11:12)

$$J^{(i)} = \begin{array}{c|c} \begin{array}{c} \frac{\partial P_2}{\partial \delta_2} \dots \frac{\partial P_2}{\partial \delta_N} \\ \vdots \\ \frac{\partial P_N}{\partial \delta_2} \dots \frac{\partial P_N}{\partial \delta_N} \end{array} & \begin{array}{c} \frac{\partial P_2}{\partial V_2} \dots \frac{\partial P_2}{\partial V_N} \\ \vdots \\ \frac{\partial P_N}{\partial V_2} \dots \frac{\partial P_N}{\partial V_N} \end{array} \\ \hline \begin{array}{c} \frac{\partial Q_2}{\partial \delta_2} \dots \frac{\partial Q_2}{\partial \delta_N} \\ \vdots \\ \frac{\partial Q_N}{\partial \delta_2} \dots \frac{\partial Q_N}{\partial \delta_N} \end{array} & \begin{array}{c} \frac{\partial Q_2}{\partial V_2} \dots \frac{\partial Q_2}{\partial V_N} \\ \vdots \\ \frac{\partial Q_N}{\partial V_2} \dots \frac{\partial Q_N}{\partial V_N} \end{array} \end{array} x - x^{(i)}$$

Now, as I said earlier, the Jacobian matrix, we have divided into four parts. J 1, J 2, J 3, J 4, where J 1 is del P by del delta, sub matrix J 2 is del P by del V sub matrix. And J 3 is del Q by del delta sub matrix and J 4 is del Q by del V sub matrix. So, this matrix as we are seeing is N minus 1 into N minus 1 for J 1 and similarly for J 2, J 3 and J 4. All these matrixes are N minus 1 to N minus 1, total size of the Jacobian is 2 into N minus 1.

(Refer Slide Time: 12:05)

Indian Institute of Technology, Kharagpur

$n \neq k$

$$J_{1_{kn}} = \frac{\partial P_k}{\partial \delta_n} = V_k Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$$

$$J_{2_{kn}} = \frac{\partial P_k}{\partial V_n} = V_k Y_{kn} \cos(\delta_k - \delta_n - \theta_{kn})$$

$$J_{3_{kn}} = \frac{\partial Q_k}{\partial \delta_n} = -V_k Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$

$$J_{4_{kn}} = \frac{\partial Q_k}{\partial V_n} = V_k Y_{kn} \sin(\delta_k - \delta_n - \theta_{kn})$$

NPTEL A.K. Sinha 12/40

Now, how do, we compute the elements of the Jacobian matrix. If we see, sorry, the elements of Jacobian matrix for J_1 is $\frac{\partial P}{\partial \delta}$. Now, we can calculate the values for N naught equal to K ; that means, for the off diagonal terms. So, we can see, how we calculate the off diagonal terms $J_{1_{kn}}$ is equal to $\frac{\partial P_k}{\partial \delta_n}$. Now, we know the equation for P_k . So, differentiating it with respect to δ_n , we can write this as V_k, Y_k and $V_n \sin \delta_k - \delta_n - \theta_{kn}$.

Similarly, for J_2 the off diagonal terms can be computed as $J_{2_{kn}}$ is equal to $\frac{\partial P_k}{\partial V_n}$. And this will be equal to V_k into Y_{kn} into $\cos \delta_k - \delta_n - \theta_{kn}$. J_3 off diagonal terms will be $\frac{\partial Q_k}{\partial \delta_n}$ this will be $-V_k, Y_{kn} V_n \cos \delta_k - \delta_n - \theta_{kn}$. And J_4 off diagonal terms will be $\frac{\partial Q_k}{\partial V_n}$, this will be $V_k, Y_{kn} \sin \delta_k - \delta_n - \theta_{kn}$. So, if we see, these are the off diagonal terms. That we have for the four sub matrixes.

(Refer Slide Time: 14:04)

Indian Institute of Technology, Kharagpur

$$n = k$$

$$J1_{kk} = \frac{\partial P_k}{\partial \delta_k} = -V_k \sum_{\substack{n=1 \\ n \neq k}}^N Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$$

$$J2_{kk} = \frac{\partial P_k}{\partial V_k} = V_k Y_{kk} \cos \theta_{kk} + \sum_{n=1}^N Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$

$$J3_{kk} = \frac{\partial Q_k}{\partial \delta_k} = V_k \sum_{\substack{n=1 \\ n \neq k}}^N Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$

$$J4_{kk} = \frac{\partial Q_k}{\partial V_k} = -V_k Y_{kk} \sin \theta_{kk} + \sum_{n=1}^N Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$$

NPTEL A.K. Sinha 13/24

For the diagonal terms, we have again for J 1 the diagonal term for the kth bus can be written as $\frac{\partial P_k}{\partial \delta_k}$, which comes out to be. If we write down the equation for P_k and differentiated with respect to δ_k , it will come out to be minus V_k summation n is equal to 1 to N , where n is not equal to k . That is for all elements, except that n is equal to k , Y_{kn} , $V_n \sin(\delta_k - \delta_n - \theta_{kn})$. So, this is in term for J 1 diagonal terms for J 1 sub matrix.

Similarly, the diagonal term for J 2 sub matrix will be $\frac{\partial P_k}{\partial V_k}$. That is given by $V_k Y_{kk} \cos \theta_{kk}$ plus summation n is equal to 1 to N , $Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$. Similarly, for J 3 the diagonal terms will be given by $\frac{\partial Q_k}{\partial \delta_k}$ this is equal to V_k , summation n is equal to 1 to N , where N is not equal to k , $Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$.

And the diagonal terms for J 4 sub matrix is $\frac{\partial Q_k}{\partial V_k}$, which is given by minus $V_k Y_{kk} \sin \theta_{kk}$ plus summation n is equal to 1 to N , $Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$. So, these are basically computed using the equation for P and Q at bus k and taking the partial derivative with respect to δ and V . That is the magnitude and the phase angle of voltage at different buses. So, once we have computed the Jacobian matrix, knowing the value of V_k and δ_k at the previous iterations. We have the Jacobian as a constant matrix.

(Refer Slide Time: 16:31)

Indian Institute of Technology, Kharagpur

Accounting for PV Buses

For each Voltage Control Bus k

- V_k (Voltage magnitude) is known
- Q_k (Reactive power injection) is not specified

Therefore, we omit

- V_k from vector X , and
- Q_k from vector Y
- Row $\frac{\partial Q_k}{\partial V_k}$ from Jacobian Matrix

NPTEL A.K. Sinha 14/40

Now, till now what we have done is, we have considered only the P Q buses. Now, we had already said earlier, that most of the generating buses, that we have, are generally having a voltage control. Because, all generators have an excitation system and an excitation control system can maintain the terminal voltage at the generator buses. So, most of the generator buses, as well as the buses, where we have reactive power sources available or control reactive power sources available.

For all those buses, we can maintain the terminal voltage and therefore, we call these, for these buses, the voltage magnitude is known and the reactive power is basically being controlled. And that is the unknown parameter for these buses. The buses as we said these generator buses or reactive power control buses are called the voltage control buses or PV buses.

For each of the voltage control bus k , we have V_k voltage magnitude is known. Q_k reactive power injection is not specified. Because, it is not known, this keeps changing depending on for maintaining the terminal voltage. So, therefore, we omit V_k from vector X . That is the state vector; because V_k is already known and Q_k from vector Y , because Q_k is not specified. So, we cannot write any equation for this.

Therefore, the row $\frac{\partial Q_k}{\partial V_k}$ from the Jacobian matrix can be eliminated. That is the $\frac{\partial Q_k}{\partial V_k}$ and $\frac{\partial Q_k}{\partial V_k}$, this row can be eliminated. That is, we do not need to write any equation reactive power injection equation for the voltage control buses.

(Refer Slide Time: 18:43)

Indian Institute of Technology, Kharagpur

That is the equation for reactive power injection Q at PV bus is eliminated from the N-R equation set.

For a power system with n buses out of which m buses are PV buses - Number of equation to be solved for N-R Power Flow is $(n-1)$ P equations + $(n-1-m)$ Q equation or $(2(n-1) - m)$ equations and the size of Jacobian Matrix will also be $(2(n-1) - m) \times (2(n-1) - m)$

NPTEL A.K. Sinha 15/40

That is the equation for reactive power injection Q at P V bus is eliminated from the Newton Raphson equation set. Therefore, we find that for a power system with n buses, n buses out of which m buses are P V buses. What is the number of equations to be solved for Newton Raphson power flow? Well, as we have seen we need to write n minus 1 P equations. Because, for n minus 1 bus, except for the slack bus, the real power injection at all other buses are specified.

And we need to write n minus 1 minus m Q equations, because we have n minus 1 buses for which we can write the Q equations. But, for m of these n minus 1 bus, the Q values are not specified, rather the voltage magnitude is known. So, we have n minus 1 minus m Q equations only. Also, if we see the number of unknowns, that we have, then we have, n minus 1 voltage phase angle, which are unknown. And n minus 1 minus m voltage magnitudes, which are unknown.

Because, we do not have the value of the voltage magnitude for P Q buses, where Q is specified, but the voltage magnitude needs to be found out. And for P V buses, the voltage magnitude is already known. So, we do not have to find out them. So, the total number of state variables or the unknowns, which we need to find is n minus 1 plus n minus 1 minus m . That is, we have $2N$ minus 1 minus m equations for our system and we have 2 into n minus 1 minus m , set of unknowns.

And if we setup this equation, then we will find that the Jacobian. That we have is also having a size, which will be $2 \times (n - 1 - m)$ into $2 \times (n - 1 - m)$. That is, it is a square matrix, where we have $2 \times (n - 1 - m)$ equations and $2 \times (n - 1 - m)$ unknowns to be solved for. And as we have seen earlier, we can solve this set of linear equations by using gauss elimination technique.

(Refer Slide Time: 21:35)

Indian Institute of Technology, Kharagpur

Algorithm for N-R Power Flow

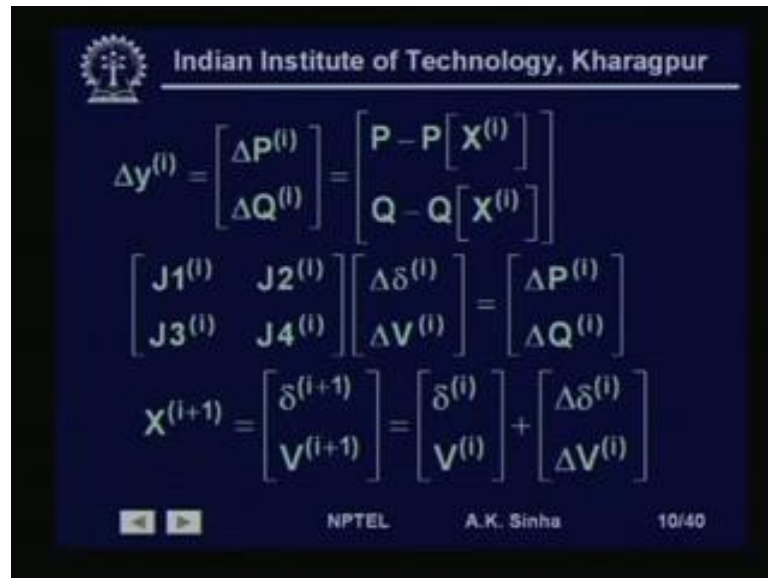

1. Make an initial guess for state vector $X^{(0)}$
2. Compute the bus power mismatches $\Delta Y^{(0)}$
3. Compute the Jacobian Matrix $J^{(0)}$
4. Solve for voltage error vector $\Delta X^{(0)} = \begin{bmatrix} \Delta \delta \\ \Delta V \end{bmatrix}^{(0)}$
5. Update state vector $X^{(1)} = X^{(0)} + \Delta X^{(0)}$
6. Increase iteration count and Go to step 2.

NPTEL A.K. Sinha 16/40

So, what is the algorithm for Newton Raphson power flow? What we have to do is, first we will make an initial guess for the state vector X^0 , as we have said earlier the easiest guess, that we have is, a flat voltage start. So, for all the buses, except the slack bus and P V buses, we choose the voltage magnitude, as 1 per unit. And for all the buses, except the slack bus, we have the voltage angle initial guess as 0 degrees.

Of course, for slack bus, the voltage angle is already chosen as 0. Because, it is a reference bus and for the slack bus and all the P V buses, we have already the voltage magnitude, which are specified, so we use those voltage magnitudes. So, using these, we have made the initial guess for the state vector. Now, compute the bus power mismatches ΔY^0 . Once, we know the value, we have made the guess of V and delta substituting the value of V and delta into the equation for real power and reactive power.

(Refer Slide Time: 23:09)

The slide displays the following equations and text:

Indian Institute of Technology, Kharagpur

$$\Delta y^{(i)} = \begin{bmatrix} \Delta P^{(i)} \\ \Delta Q^{(i)} \end{bmatrix} = \begin{bmatrix} P - P[X^{(i)}] \\ Q - Q[X^{(i)}] \end{bmatrix}$$
$$\begin{bmatrix} J_1^{(i)} & J_2^{(i)} \\ J_3^{(i)} & J_4^{(i)} \end{bmatrix} \begin{bmatrix} \Delta \delta^{(i)} \\ \Delta V^{(i)} \end{bmatrix} = \begin{bmatrix} \Delta P^{(i)} \\ \Delta Q^{(i)} \end{bmatrix}$$
$$X^{(i+1)} = \begin{bmatrix} \delta^{(i+1)} \\ V^{(i+1)} \end{bmatrix} = \begin{bmatrix} \delta^{(i)} \\ V^{(i)} \end{bmatrix} + \begin{bmatrix} \Delta \delta^{(i)} \\ \Delta V^{(i)} \end{bmatrix}$$

NPTEL A.K. Sinha 10/40

We can find out the mismatch, using this relationship. P specified minus P calculated with the value of X, known at the initial guess. Q specified minus Q calculated with X at the specified value. So, using this, we can find out this delta P and delta Q, which is basically our delta Y. So, compute the bus power mismatches delta Y. Next step is, compute the Jacobian matrix J 0. That is with the initial guess state vector X.

That knows all the voltage magnitude and angles with the guess initial values known. We compute the value for the elements of the Jacobian matrix at the initial operating point. Now, solve for voltage error vector delta X which is delta, delta and delta V, from the initial guess. That is the error vector, based on the initial guess. We can find out using, as we have seen earlier, this relationship using this relationship, we solve for this.

Now, this is already known at the initial value. This is known at the initial value, this is what we need to compute at the initial state. So, once we have computed this error vector, then we update the state vector, as the as value of state vector at first iteration is equal to the value of state vector at initial guess. Plus the voltage error vector or the error vector error in state vector. So, we add this, we get the value at the first iteration.

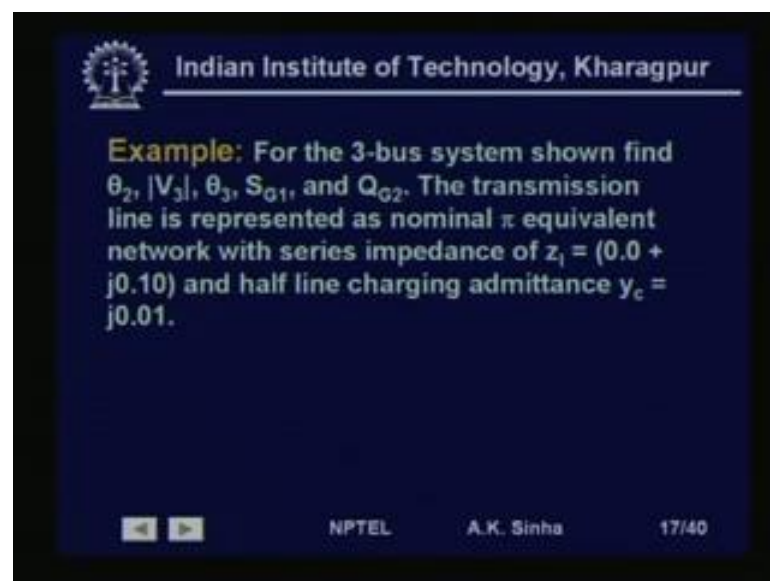

Now, we increase the iteration count and again go back to compute the bus power mismatches, delta Y 1, now knowing X 1. Similarly, compute the Jacobian matrix J 1, solve for error vector delta X 1 as delta, delta and delta V at for the first iteration. Then,

update the state vector, you will get X_2 is equal to X_1 plus ΔX_1 and so on. We will keep repeating this iteration, till we find that ΔY has become very small.

Because, once this ΔY or the power mismatches are very small, which means, that the value of the calculated bus power injections are very nearly equal to the specified value, that means, we have got a converge solution. That is the voltage magnitude and the angles, that we have got now is giving me a complete solution for this system. That is substituting these values of voltage magnitude and the angles. We will be able to get the same values as specified for the real power and reactive power injections at the buses.

Now, once we know these values of the voltage magnitude and angle. Then, rest of the values, which are basically the real power and reactive power at the slack bus. And the reactive power injections at the P V buses can be computed by substituting this value of del value of V and delta, which we have found as a final solution.

(Refer Slide Time: 27:26)

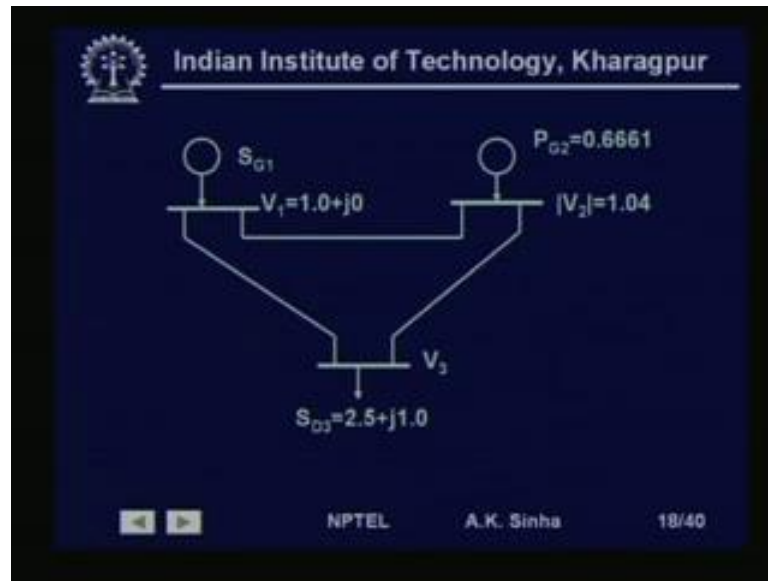

Indian Institute of Technology, Kharagpur

Example: For the 3-bus system shown find θ_2 , $|V_3|$, θ_3 , S_{G1} , and Q_{G2} . The transmission line is represented as nominal π equivalent network with series impedance of $z_1 = (0.0 + j0.10)$ and half line charging admittance $y_c = j0.01$.

NPTEL A.K. Sinha 17/40

Now, we will take one example for solving this. What we do is, we will take a small three bus system as shown in the figure.

(Refer Slide Time: 27:33)

Here, we have a three bus system, this is bus 1, this is bus 2 and this is bus 3. Now, bus 1, we have chosen as a slack bus. So, here the voltage magnitude, as well as angle specified. We have port here voltage magnitude as 1 per unit and angle is 0 degrees. That is, in rectangular coordinate form, we can write it as 1.0 plus J 0. So, voltage magnitude and angle at this is specified. The real and reactive power injection at this bus is unknown.

Bus number 2, as we see here the voltage magnitude is specified as 1.04 and the real power injection into the bus is also specified as 0.661 per unit. Now, here, what is unknown is the voltage angle delta 2 and Q G 2. So, at this bus, we have Q G 2, the reactive power injection into the bus and the voltage phase angle is unknown. This is bus number 3, at this bus; we only have a load, which has a value of 2.5 plus J, 1.0. That is, 2.5 per unit real power and 1.0 per unit reactive power.

So, at this bus, both P and Q injections are known. P injection will be minus 2.5 and Q injection will be minus 1.0. Because, the injections, we are saying will be into the bus as positive. Since, this is coming out of the bus. So, we will have to take the negative of this, which we can say that here S G is 0. So, P G is 0. So, 0 minus 2.5 will give me P I and 0 minus 1.0 will give me Q I at this bus.

So, that again can be written in the same way as minus 2.5 minus J, 1.0 will be the injections into this bus. Now, this is a slack bus, this bus we have the real power

specified and the voltage magnitude specified. So, this is a PV bus, this bus both the real and reactive power are specified. So, this is a P Q bus.

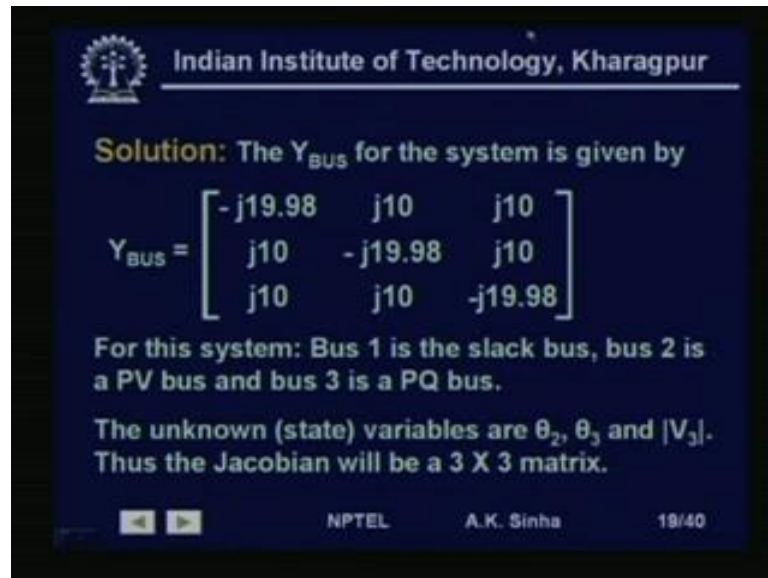

So, now if we see the problem, we have for the three bus system shown, find. What we need to find? That is θ_2 , here we have written, which is the phase angle of the voltage at bus 2. Magnitude of voltage at bus 3, θ_3 , which is the angle of voltage at bus 3 and we also need to find out the real and reactive power injection at the slack bus. And the reactive power injection at the P V bus or bus 2.

Now, the transmission lines, that we have in this system. We have a transmission line between 1 and 2, a transmission line between 1 and 3, another transmission line between 2 and 3. Now, all these transmission lines are represented as nominal pi equivalent network. So, as we had seen, when we derive the equivalent circuit for a transmission line, that we can represent a transmission line by a pi equivalent or a nominal pi equivalent circuit.

For which, we have the series impedance for this system of line given as $0.0 + j, 0.10$. That is resistance is neglected are negligible and the line has a inductive reactive of 1.10 per unit and the half line charging admittance of the line is $j, 0.01$. That is the half line charging capacitive element at the two legs, two hands of the network or the two buses is equal to $j, 0.1$ per unit in terms of capacitive, susceptance.

So, this is the system, that we have and now we will see, how we set up the equations and solve using Newton Raphson power flow to get the values for the unknowns. That is θ_2 , for this V_3 and θ_3 for this. And of course, after we have, what those values we can compute $P_G 1$, $Q_G 1$ and $Q_G 2$.

(Refer Slide Time: 32:55)

Indian Institute of Technology, Kharagpur

Solution: The Y_{BUS} for the system is given by

$$Y_{BUS} = \begin{bmatrix} -j19.98 & j10 & j10 \\ j10 & -j19.98 & j10 \\ j10 & j10 & -j19.98 \end{bmatrix}$$

For this system: Bus 1 is the slack bus, bus 2 is a PV bus and bus 3 is a PQ bus.

The unknown (state) variables are θ_2 , θ_3 and $|V_3|$. Thus the Jacobian will be a 3 X 3 matrix.

NPTEL A.K. Sinha 19/40

Now, first thing, what we will do is, we will form the Y bus matrix for the system. Now, as we have seen the real power, the series reactance for the line is 0.1. So, in terms of admittance, we will get this as minus 10. So, and the off diagonal terms for the admittance matrix as we have seen is minus Y i j. So, we have got J 10, J 10 as for all the lines are having the same impedance. So, we have got this.

Now, the diagonal terms, as we have seen, will have the sum of all the series admittances connected to the bus, plus the line charging capacitances connected for the lines, which is connected to the bus. So, half line charging at the ends of the line is also to be added. When, we do that, then we see that for this line, we have this bus, we have two lines. One between 1 and 2, another between 1 and 3 and both will have a half line charging of 0.01 per unit.

So, minus 0.02 per unit is going to be added to this. So, we have got minus J 19.98, because the some of the two series admittances for these two lines will be J 20. So, minus J 20 and then we have to subtract from this, because we have the capacitive susceptances for the line charging. So, this comes out to be minus J 19.98. Same will be occurring for bus 2 and bus 3.

Therefore, for this system as I said earlier, bus 1 is slack bus, bus 2 is a P V bus and bus 3 is a P Q bus. The unknown state variables are theta 2, theta 3 and V 3. That is the voltage angle at bus 2, bus 3 and the voltage magnitude at bus 3. Thus the Jacobian

matrix for the system will also be a 3 by 3 matrix. What we have is the knowns or the specified values will be P 2, P 3 and we have the specified value of Q 3. So, three known's, three unknowns and we will have. So, three sets of equations and the Jacobian matrix will be a 3 by 3 matrix.

(Refer Slide Time: 35:56)

Indian Institute of Technology, Kharagpur

Also, we have functions defined for active and reactive power injections as

$$P_i(x) = \sum_{k=1}^n |V_i| \cdot |V_k| [G_{ik} \cos(\theta_i - \theta_k) + B_{ik} \sin(\theta_i - \theta_k)]$$

$$Q_i(x) = \sum_{k=1}^n |V_i| \cdot |V_k| [G_{ik} \sin(\theta_i - \theta_k) - B_{ik} \cos(\theta_i - \theta_k)]$$

NPTEL A.K. Sinha 20/40

So, we have as us we had written earlier, we are again writing the in real and reactive power injection equations here.

(Refer Slide Time: 36:08)

Indian Institute of Technology, Kharagpur

Real Power equations for bus 2 and 3:

$$P_2(x) = |V_2| \cdot |V_1| \cdot B_{21} \cdot \sin(\theta_2 - \theta_1) + |V_2| \cdot |V_3| \cdot B_{23} \cdot \sin(\theta_2 - \theta_3)$$

$$= 10.4 \sin\theta_2 + 10.4 |V_3| \sin(\theta_2 - \theta_3) \quad (1)$$

$$P_3(x) = |V_3| \cdot |V_1| \cdot B_{31} \cdot \sin(\theta_3 - \theta_1) + |V_3| \cdot |V_2| \cdot B_{32} \cdot \sin(\theta_3 - \theta_2)$$

$$= 10 |V_3| \sin\theta_3 + 10.4 |V_3| \sin(\theta_3 - \theta_2) \quad (2)$$

NPTEL A.K. Sinha 21/40

Now, substituting, so real power equations for bus 2 and 3, we can be written in this form. Because, here we have seen that the real part for the Y bus is 0. So, G's are not there. So, only B is present. So, we write the equation like this $V_2, V_1, B_{21} \sin \theta_2$ minus θ_1 plus V_2, V_3 into $V_{23} \sin \theta_2$ minus θ_3 .

Now, substituting the values of B_{21}, B_{23} , we get this as $10.4 \sin \theta_2$ plus $10.4, V_3 \sin \theta_2$ minus θ_3 . Now, here θ_1 is the slack bus angle, which is 0. So, this is $\sin \theta_2$ minus 0. So, we have written this as $\sin \theta_2$. Similarly, for P_3 , we can write the equation and we get this as $V_3, V_1, V_{31} \sin \theta_3$ minus θ_1 plus $V_3, V_2 \sin B_{32} \sin \theta_3$ minus θ_2 . So, this comes out to be $10, V_3 \sin \theta_3$ plus $10.4, V_3 \sin \theta_3$ minus θ_2 .

(Refer Slide Time: 37:38)

Indian Institute of Technology, Kharagpur

Reactive power equation for bus 3:

$$Q_3(x) = - [|V_3| \cdot |V_1| \cdot B_{31} \cos(\theta_3 - \theta_1) + |V_3| \cdot |V_2| \cdot B_{32} \cos(\theta_3 - \theta_2) + |V_3|^2 B_{33}]$$

$$= - [10 |V_3| \cdot \cos \theta_3 + 10.4 |V_3| \cdot \cos(\theta_3 - \theta_2) - 19.98 |V_3|^2] \quad (3)$$

We also define the unknown vector and the Jacobian for the system as

$$X = \begin{bmatrix} \theta_2 \\ \theta_3 \\ |V_3| \end{bmatrix}$$

NPTEL A.K. Sinha 22/40

And again the reactive power equation for bus 3 can be written in terms of Q_3 is equal to minus $V_3, V_1, V_{31} \cos \theta_3$ minus θ_1 plus $V_3, V_2, B_{32} \cos \theta_3$ minus θ_2 plus V_3 square into B_{33} . So, substituting again the values of B_{31}, B_{32} , and B_{33} , we will get this as minus $10, V_3 \cos \theta_3$ plus $10.4, V_3 \cos \theta_3$ minus θ_2 minus $19.98 V_3$ square. Now, we define the unknown vector and the Jacobian matrix of the system. What is the unknown vector, the state vector, which we need to find is θ_2, θ_3 and V_3 as we had said earlier.

(Refer Slide Time: 38:37)

Indian Institute of Technology, Kharagpur

and

$$J(x) = \begin{bmatrix} \frac{\partial P_2}{\partial \theta_2} & \frac{\partial P_2}{\partial \theta_3} & \frac{\partial P_2}{\partial |V_3|} \\ \frac{\partial P_3}{\partial \theta_2} & \frac{\partial P_3}{\partial \theta_3} & \frac{\partial P_3}{\partial |V_3|} \\ \frac{\partial Q_3}{\partial \theta_2} & \frac{\partial Q_3}{\partial \theta_3} & \frac{\partial Q_3}{\partial |V_3|} \end{bmatrix}$$

NPTEL A.K. Sinha 23/40

And the Jacobian matrix, that we will have will be del P 2 by del theta 2, del P 2 by del theta 3, del P 2 by del V 3, for the first set of equations for the real power P 2. For real power P 3 equations, the partial derivatives with respect to the state vectors will be del P 3 by del theta 2, del P 3 by del theta 3, del P 3 by del V 3. Similarly, for the reactive power equation at bus 3, the partial derivatives with respect to the state variables will be del Q 3 by del theta 2, del Q 3 by del theta 3, del Q 3 by del V 3. So, this 3 by 3, Jacobian matrix will be there.

(Refer Slide Time: 39:26)

Indian Institute of Technology, Kharagpur

We can find the terms of the Jacobian matrix by partial derivation of equations (1), (2) and (3).

$$\frac{dP_2}{d\theta_2} = \frac{|V_2||V_1| B_{21} \cos(\theta_2 - \theta_1) + |V_2||V_3| B_{23} \cos(\theta_2 - \theta_3)}{\cos(\theta_2 - \theta_3)}$$

$$= 10.4 \cos\theta_2 + 10.4 |V_3| \cos(\theta_2 - \theta_3)$$

Similarly we have,

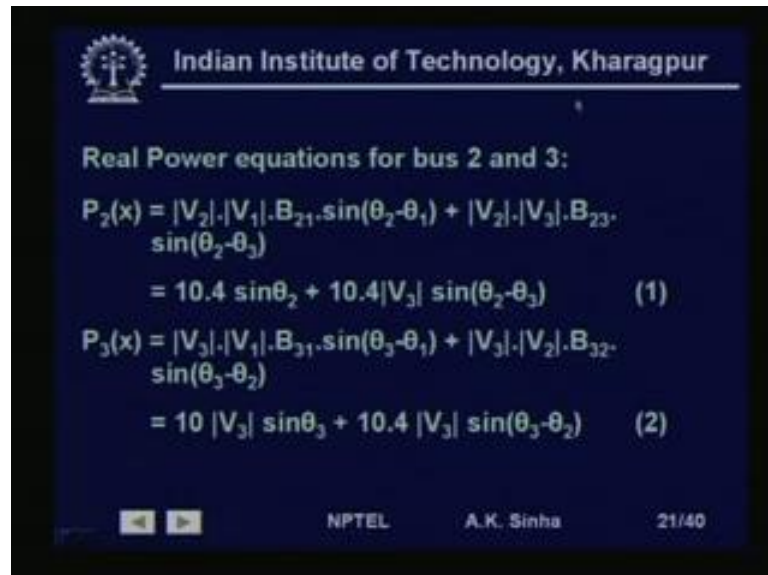

$$\frac{dP_2}{d\theta_3} = -10.4 |V_3| \cos(\theta_2 - \theta_3)$$

$$\frac{dP_2}{d|V_3|} = 10.4 \sin(\theta_2 - \theta_3)$$

NPTEL A.K. Sinha 24/40

We can find the terms of the Jacobian matrix by partial derivation of the equation 1, 2 and 3. That is what the equations that we had written here.

(Refer Slide Time: 39:38)

Indian Institute of Technology, Kharagpur

Real Power equations for bus 2 and 3:

$$P_2(x) = |V_2| \cdot |V_1| \cdot B_{21} \cdot \sin(\theta_2 - \theta_1) + |V_2| \cdot |V_3| \cdot B_{23} \cdot \sin(\theta_2 - \theta_3)$$

$$= 10.4 \sin\theta_2 + 10.4 |V_3| \sin(\theta_2 - \theta_3) \quad (1)$$

$$P_3(x) = |V_3| \cdot |V_1| \cdot B_{31} \cdot \sin(\theta_3 - \theta_1) + |V_3| \cdot |V_2| \cdot B_{32} \cdot \sin(\theta_3 - \theta_2)$$

$$= 10 |V_3| \sin\theta_3 + 10.4 |V_3| \sin(\theta_3 - \theta_2) \quad (2)$$

NPTEL A.K. Sinha 21/40

These three equations, 1, 2 and 3, so by finding out the partial derivatives for these three equations, we can write or get the elements of the Jacobian matrix $\frac{\partial P_2}{\partial \theta_2}$. Will come out to be like this, $\frac{\partial P_2}{\partial \theta_3}$ will come out to be like this and $\frac{\partial P_2}{\partial V_3}$, will come out to be like this. That is $\frac{\partial P_2}{\partial \theta_2}$ is $10.4 \cos \theta_2 + 10.4 |V_3| \cos(\theta_2 - \theta_3)$. $\frac{\partial P_2}{\partial \theta_3}$ will be $-10.4 |V_3| \cos(\theta_2 - \theta_3)$ and $\frac{\partial P_2}{\partial V_3}$ is $10.4 \sin(\theta_2 - \theta_3)$.

(Refer Slide Time: 40:33)

Indian Institute of Technology, Kharagpur

$$\frac{dP_3}{d\theta_2} = -10.4 |V_3| \cos(\theta_3 - \theta_2)$$

$$\frac{dP_3}{d\theta_3} = 10.0 |V_3| \cos\theta_3 + 10.4 |V_3| \cos(\theta_3 - \theta_2)$$

$$\frac{dP_3}{d|V_3|} = 10 \sin\theta_3 + 10.4 \sin(\theta_3 - \theta_2)$$

$$\frac{dQ_3}{d\theta_2} = -10.4 |V_3| \sin(\theta_3 - \theta_2)$$

$$\frac{dQ_3}{d\theta_3} = 10 |V_3| \sin\theta_3 + 10.4 |V_3| \sin(\theta_3 - \theta_2)$$

$$\frac{dQ_3}{d|V_3|} = -[10 \cos\theta_3 + 10.4 \cos(\theta_3 - \theta_2) - 39.96 |V_3|]$$

NPTEL A.K. Sinha 25/40

Similarly, for P 3 we will have del P 3 by del theta 2 as this del P 3 by del theta 3 and so on, for all these terms, we can compute.

(Refer Slide Time: 40:49)

Indian Institute of Technology, Kharagpur

We now start the iteration using the equation

$$J(x) \cdot X = \begin{bmatrix} \Delta P_2(x) \\ \Delta P_3(x) \\ \Delta Q_3(x) \end{bmatrix}$$

We have, $P_2 = P_{G2} = 0.6661$,
 $P_3 = -P_{D3} = -2.5$,
and $Q_3 = -Q_{D3} = -1.0$;

We start with an initial guess
 $\theta_2^0 = \theta_3^0 = 0^\circ, |V_3^0| = 1.0$

NPTEL A.K. Sinha 26/40

Now, we can start the iteration using the equations J, X, J , which is a function of x into X is equal to Y , which is $\Delta P_2, \Delta P_3$ and ΔQ_3 . Now, we have the specified value of P_2 , which is P_{G2} is 0.661, 6661 per unit. P_3 the injection is minus P_{D3} , this is equal to minus 2.5 and Q_3 is equal to minus Q_{D3} , which is equal to minus 1.0. Now, if we said earlier, we start with an initial guess for the unknown voltages magnitude and

the angles as $\theta_2 = 0$ $\theta_3 = 0$ is equal to 0 degree and $V_3 = 1.0$. That is, we assume the voltages magnitudes for the unknown voltage as 1.0. And the voltage phase angle for the unknown phase angles of voltage as 0 degrees. That is our initial guess.

(Refer Slide Time: 42:03)

Indian Institute of Technology, Kharagpur

$$\begin{bmatrix} \Delta P_2(x) \\ \Delta P_3(x) \\ \Delta Q_3(x) \end{bmatrix} = \begin{bmatrix} P_2 \\ P_3 \\ Q_3 \end{bmatrix} - \begin{bmatrix} P_2(x^0) \\ P_3(x^0) \\ Q_3(x^0) \end{bmatrix}$$

The values of the $P_2(x^0)$, $P_3(x^0)$ and $Q_3(x^0)$ can be calculated from equations (1), (2) & (3). Putting the values, we get

$$\begin{bmatrix} \Delta P_2(x) \\ \Delta P_3(x) \\ \Delta Q_3(x) \end{bmatrix} = \begin{bmatrix} 0.6661 \\ -2.5 \\ -1.0 \end{bmatrix} - \begin{bmatrix} 0 \\ 0 \\ -0.42 \end{bmatrix} = \begin{bmatrix} 0.6661 \\ -2.5 \\ -0.58 \end{bmatrix}$$

NPTEL A.K. Sinha 27/40

So, we can get the value of the mismatches ΔP_2 , ΔP_3 and ΔQ_3 from the specified value of P_2 , P_3 , Q_3 minus the value of P_2 calculated with the initial guess values of x . So, P_2 calculated P_3 calculated and Q_3 calculated the value of P_2 at x is equal to 0. P_3 at x is equal to 0 and Q_3 , this should be Q_3 at x is equal to x^0 can be calculated from equations 1, 2 and 3. Putting the values, we get ΔP_2 , ΔP_3 , ΔQ_3 as equal to 0.6661 minus this comes out to be 0.

So, this is 0.06661, this is ΔP_3 is specified value is minus 2.5. The calculated value is 0. So, this comes out to be minus 2.5. ΔQ_3 the specified value is minus 1.0. The calculated value comes out to be with the initial guess value comes out to be 0.42. So, we have minus 0.58 as the mismatch ΔQ_3 .

(Refer Slide Time: 43:26)

Indian Institute of Technology, Kharagpur

Next, we find the jacobian matrix J^0 as

$$J^{(0)} = \begin{bmatrix} 20.8 & -10.4 & 0 \\ -10.4 & 20.4 & 0 \\ 0 & 0 & 19.56 \end{bmatrix}$$

To find the changes in our unknown quantities, we need the value of the inverse of the Jacobian.

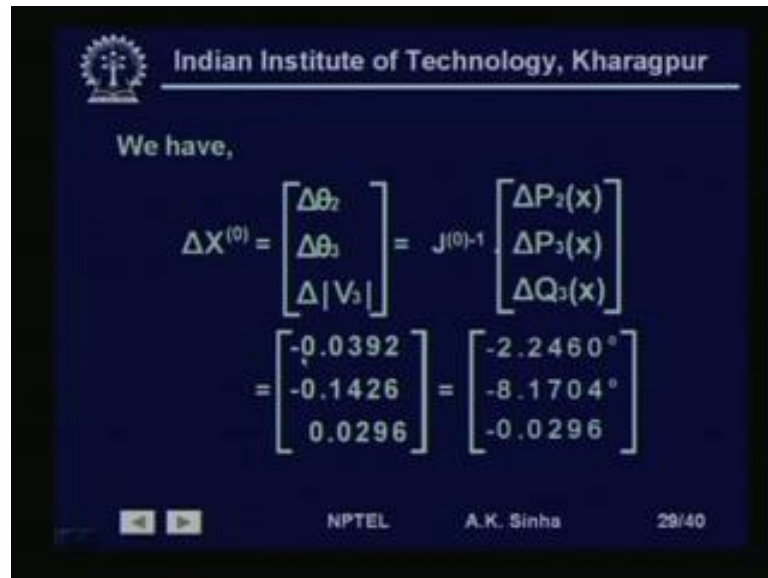

$$J^{(0)-1} = \begin{bmatrix} 0.0645 & 0.0329 & 0 \\ 0.0329 & 0.0658 & 0 \\ 0 & 0 & 0.0511 \end{bmatrix}$$

NPTEL A.K. Sinha 28/40

Similarly, we can calculate the Jacobian matrix elements by substituting the value of the state variables with the initial the guess values. So, this comes out to be the 3 by 3 Jacobian matrix, 20.8 minus 10.4, 0 minus 10.4, 20.4, 0, 0,0 19.56. So, this is 3 by 3 Jacobian matrix, that we have. So, what we need to do is, we can solve the equation now, that $\frac{\partial P}{\partial Q}$ is equal to $J \frac{\partial X}{\partial V}$ or that is $\frac{\partial \delta}{\partial V}$.

So, for that either we can take a inverse or we can solve it using gauss elimination. Since, this is a 3 by 3 matrix and also, this is a block diagonal matrix. That is this 2 by 2 and this 1 by 1. So, we can take the inverse of this 2 by 2 and take an inverse of this. That is 1 by this. So, if we do that, then we get this inverse Jacobian matrix like this.

(Refer Slide Time: 44:36)

The slide displays the following equation:

$$\Delta X^{(0)} = \begin{bmatrix} \Delta\theta_2 \\ \Delta\theta_3 \\ \Delta|V_3| \end{bmatrix} = J^{(0)-1} \begin{bmatrix} \Delta P_2(x) \\ \Delta P_3(x) \\ \Delta Q_3(x) \end{bmatrix}$$
$$= \begin{bmatrix} -0.0392 \\ -0.1426 \\ 0.0296 \end{bmatrix} = \begin{bmatrix} -2.2460^\circ \\ -8.1704^\circ \\ -0.0296 \end{bmatrix}$$

At the bottom of the slide, there are navigation icons (back and forward arrows), the text "NPTEL", the name "A.K. Sinha", and the slide number "29/40".

So, using that, we can calculate the change in the state vector. So, initial error of the state vector, will be given by J_0 inverse into ΔP_2 , that is ΔY . So, if we substitute that then we solving it, we will get the value of ΔX_0 as 0 minus 0.0392 minus 0.1246. So, this is $\Delta\theta_2$, this is $\Delta\theta_3$ and this is ΔV_3 . So, these values, you mind it, the angle values, when we calculate, using this will be in radians.

So, we can convert them degrees, which we will get like this. This θ_2 comes out to be 2 minus 2.246 degrees, $\Delta\theta_3$ comes out to be minus eight point one seven 0 8.1704 degrees. And ΔV_3 comes out to be 0.0296 per unit.

(Refer Slide Time: 46:00)

Indian Institute of Technology, Kharagpur

Next, we find the value of the unknown vector for the next iteration

$$X^{(1)} = X^{(0)} + \Delta X^{(0)} = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} + \begin{bmatrix} -2.2460^\circ \\ -8.1704^\circ \\ -0.0296 \end{bmatrix}$$
$$= \begin{bmatrix} -2.2460^\circ \\ -8.1704^\circ \\ 0.9704 \end{bmatrix}$$

NPTEL A.K. Sinha 30/40

So, using this error values at the first iteration, we get the updated value of the state variables at the first iteration as X_1 is equal to X_0 plus ΔX_0 . So, the initial guess value of X_0 was 0 degree 0 degrees and 1 per unit. So, we add to this the ΔX , which is the value, when we substitute. So, we get the value of the state variable, after first iteration as θ_2 is equal to minus 2.246 degrees. θ_3 is minus 8.1704 degrees and V_3 as 0.9704 per unit.

(Refer Slide Time: 46:50)

Indian Institute of Technology, Kharagpur

We proceed to the next iteration using the new values $\theta_2^1 = -2.9395^\circ$, $\theta_3^1 = -9.5111^\circ$, and $|V_3^1| = 0.9638$.

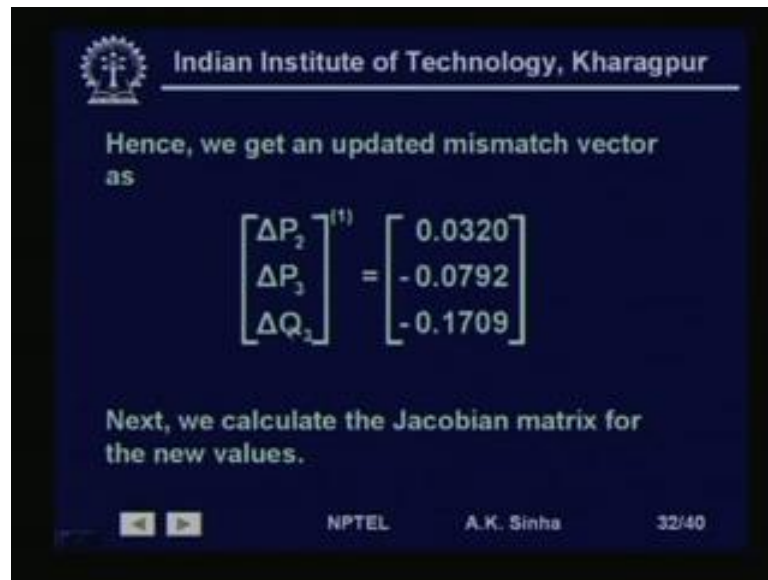

Using the equation (1), (2) and (3), we get

$$\begin{bmatrix} P_2(X) \\ P_3(X) \\ Q_2(X) \end{bmatrix}^{(1)} = \begin{bmatrix} 0.6341 \\ -2.4208 \\ -0.8291 \end{bmatrix}$$

NPTEL A.K. Sinha 31/40

So, once, we have these values now. So, using we proceed to the next iteration using the new values. So, when we substitute this value, again we will calculate P 2, P 3, Q 3 at the first iteration, which we get like this.

(Refer Slide Time: 47:13)

Indian Institute of Technology, Kharagpur

Hence, we get an updated mismatch vector as

$$\begin{bmatrix} \Delta P_2 \\ \Delta P_3 \\ \Delta Q_3 \end{bmatrix}^{(1)} = \begin{bmatrix} 0.0320 \\ -0.0792 \\ -0.1709 \end{bmatrix}$$

Next, we calculate the Jacobian matrix for the new values.

NPTEL A.K. Sinha 32/40

So, we can calculate delta P 2 delta P 3 and delta Q 3, which will be again calculated value specified value minus the calculated value, where the calculated value is computed using the updated or the first iteration value of the state variables. So, when we do that, we get these values like this. Now, we calculate the Jacobian matrix with the new values of X.

(Refer Slide Time: 47:47)

Indian Institute of Technology, Kharagpur

We get,

$$J^{(1)} = \begin{bmatrix} 20.4303 & -10.0382 & 1.0734 \\ -10.0382 & 19.6438 & -2.4946 \\ 1.0417 & -2.4218 & 18.5342 \end{bmatrix}$$

Similarly, the updated inverse matrix is

$$J^{(1)-1} = \begin{bmatrix} 0.0654 & 0.0335 & 0.0007 \\ 0.0335 & 0.0689 & 0.0073 \\ 0.0007 & 0.0071 & 0.0549 \end{bmatrix}$$

NPTEL A.K. Sinha 33/40

We see that we have a Jacobian matrix, a 3 by 3 Jacobian matrix given like this at the first iteration values of X. Similarly, the updated inverse can be computed like this.

(Refer Slide Time: 48:01)

Indian Institute of Technology, Kharagpur

We have,

$$\Delta X^1 = \begin{bmatrix} \Delta \theta_2 \\ \Delta \theta_3 \\ \Delta |V_3| \end{bmatrix}^{(1)} = J_0^{-1} \cdot \begin{bmatrix} \Delta P_2(x) \\ \Delta P_3(x) \\ \Delta Q_3(x) \end{bmatrix}$$
$$= \begin{bmatrix} -0.00068 \\ -0.00564 \\ -0.00992 \end{bmatrix} = \begin{bmatrix} -0.0390^\circ \\ -0.3231^\circ \\ -0.0099 \end{bmatrix}$$

NPTEL A.K. Sinha 34/40

And once, we have this, we can get delta X 1, the error in state variables at first, after first iteration. So, this comes out to be 0.00068. That is delta theta 2. After, first iteration comes out to be this, delta theta 3. After, first iteration comes out to be minus 0.00564. Radians and delta V 3, after first iteration substituting the first iteration values or solving after using the first iteration values, comes out to be minus 0.00992.

When, we convert these two values, which are in radians in to degrees comes out to be this much. That is minus 0.0390 degrees minus 0.3231 degrees and the voltage will be change in voltage will be minus 0.0099 per unit.

(Refer Slide Time: 49:06)

Indian Institute of Technology, Kharagpur

Again, calculating the value of $X^{(2)}$

$$X^{(2)} = X^{(1)} + \Delta X^{(1)}$$

$$= \begin{bmatrix} -2.2460 & -0.039 \\ -8.1704 & -0.3231 \\ 0.9704 & -0.0099 \end{bmatrix} = \begin{bmatrix} -2.2850 \\ -8.4935 \\ 0.9605 \end{bmatrix}$$

NPTEL A.K. Sinha 35/40

So, again, we can get the updated value at the second iteration as the value at the first iteration plus the change or the error computed after first iteration. So, when we do that, we get the values as minus 2.2850 degrees minus 8.4935 degrees and the voltage magnitude V_3 as 0.9605 per unit.

(Refer Slide Time: 49:34)

Indian Institute of Technology, Kharagpur

We proceed to the next iteration using the new values $\theta_2^{(2)} = -2.285^\circ$, $\theta_3^{(2)} = -8.4935^\circ$, and $|V_3^{(2)}| = 0.9605$.

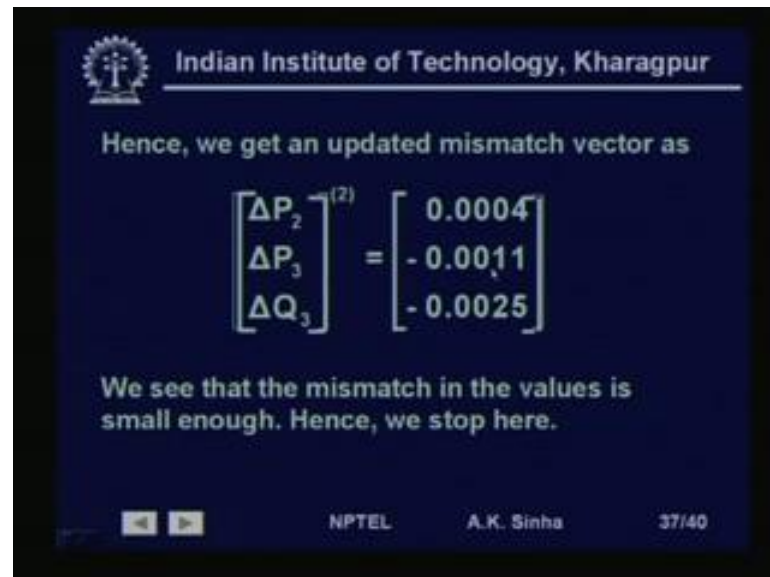

Using the equation (1), (2) and (3), we get

$$\begin{bmatrix} P_2(X) \\ P_3(X) \\ Q_3(X) \end{bmatrix}^{(2)} = \begin{bmatrix} 0.66565 \\ -2.49890 \\ -0.99752 \end{bmatrix}$$

NPTEL A.K. Sinha 36/40

Now, again using these values, we can compute the calculated values for P 2, P 3 and Q 3, which comes out to be this much. That is P 2 with the new values of the voltage magnitude and angle comes out to be 0.66565. And the P 3 comes out to be minus 2.49890 and Q 3 comes out to be minus 0.99752.

(Refer Slide Time: 50:07)

Indian Institute of Technology, Kharagpur

Hence, we get an updated mismatch vector as

$$\begin{bmatrix} \Delta P_2 \\ \Delta P_3 \\ \Delta Q_3 \end{bmatrix}^{(2)} = \begin{bmatrix} 0.0004 \\ -0.0011 \\ -0.0025 \end{bmatrix}$$

We see that the mismatch in the values is small enough. Hence, we stop here.

NPTEL A.K. Sinha 37/40

Now, if we use these calculated values, then we can calculate the mismatches ΔP_2 , ΔP_3 and ΔQ_3 , which will be again P_2 specified minus P_2 calculated, When, we do that this comes to be 0.004 per unit, ΔP_3 comes out to be minus 0.0011 per unit and ΔQ_3 comes out to be minus 0.0025 per unit. What we are saying is, that the mismatch values have now come to be very small. If we do another iteration, the values will become very, very small. So, what we are saying is, that we can if accept this kind of an accuracy, then we have already obtained our solution, where we have the value of X.

(Refer Slide Time: 51:02)

Indian Institute of Technology, Kharagpur

For the given problem, we have,

$$P_{G1} = P_1 = |V_1| \cdot |V_2| \cdot B_{12} \sin(\theta_1 - \theta_2) + |V_1| \cdot |V_3| \cdot B_{13} \sin(\theta_1 - \theta_3)$$
$$= 1.8333$$
$$Q_{G1} = Q_1 = - [|V_1| \cdot |V_2| \cdot B_{12} \cos(\theta_1 - \theta_2) + |V_1| \cdot |V_3| \cdot B_{13} \cos(\theta_1 - \theta_3) + |V_1|^2 B_{11}]$$
$$= 0.0886$$

NPTEL A.K. Sinha 38/40

That is theta 2 as minus 2.285 degrees theta 3 as minus 8.4935 degrees and V 3 as 0.9605 per unit. So, this is the solution that we have, that is with these values, we have got quite a good convergence and we have got this convergence in just two iterations. If you do one more iteration, the convergence can be up to four or five decimal places. So, we have got the solution now, so using this value of V and delta for all the buses. Now, since they are known if we substitute in the equation for P G 1 and Q G 1, we get P G 1 as 1.8333 per unit and Q G 1 as 0.0886 per unit. Sorry and Q G 2 as 1.288 per unit.

(Refer Slide Time: 52:14)

Indian Institute of Technology, Kharagpur

$$Q_{G2} = Q_2 = - [|V_2| \cdot |V_1| \cdot B_{21} \cos(\theta_2 - \theta_1) + |V_2| \cdot |V_3| \cdot B_{23} \cos(\theta_2 - \theta_3) + |V_2|^2 B_{22}]$$
$$= 1.288$$

NPTEL A.K. Sinha 39/40

So, this is the complete solution for this network. That is, we know now all the unknowns. Now, knowing these values of voltage magnitude and angle at all the buses, as well as the injections at all the buses. Now, if we want, we can calculate the power flow in each of the lines as well. So, this is all about solving the power flow equations using Newton Raphson method. The advantage of using Newton Raphson method, as we had seen is you need much less number of iterations. In fact, even for very large systems of 1000's buses and so you need only 4, 5 iterations to achieve the convergence up to acceptable levels.

(Refer Slide Time: 53:28)

Indian Institute of Technology, Kharagpur

We get,

$$J^{(1)} = \begin{bmatrix} 20.4303 & -10.0382 & 1.0734 \\ -10.0382 & 19.6438 & -2.4946 \\ 1.0417 & -2.4218 & 18.5342 \end{bmatrix}$$

Similarly, the updated inverse matrix is

$$J^{(1)-1} = \begin{bmatrix} 0.0654 & 0.0335 & 0.0007 \\ 0.0335 & 0.0689 & 0.0073 \\ 0.0007 & 0.0071 & 0.0549 \end{bmatrix}$$

NPTEL A.K. Sinha 33/40

Another aspect, which is very important here is that the Jacobian matrix. That we have here, since it is a three bus system and all the buses are connected to all other buses is a full matrix. But, in a general the Jacobian matrix, will be a sparse matrix. Just like, the Y bus matrix, which is a sparse matrix. Because, we know all the buses are not connected to all other buses in a large system.

In fact, each bus maybe connected to just a few other buses and therefore the Y bus will contain large number of 0's. Similarly, the Jacobian will also contain large number of 0's, these matrices as we said earlier are called sparse matrices. And we take advantage of the sparsity of these matrices, if in solution to make the solution much more, faster. So, with this, we have completed the Newton Raphson load flow.

Now, in the next lesson, we will talk about another version of load flow, which is very popular, which we call fast decoupled load flow. So, with this we end today's lesson.

Thank you very much.

Power Flow

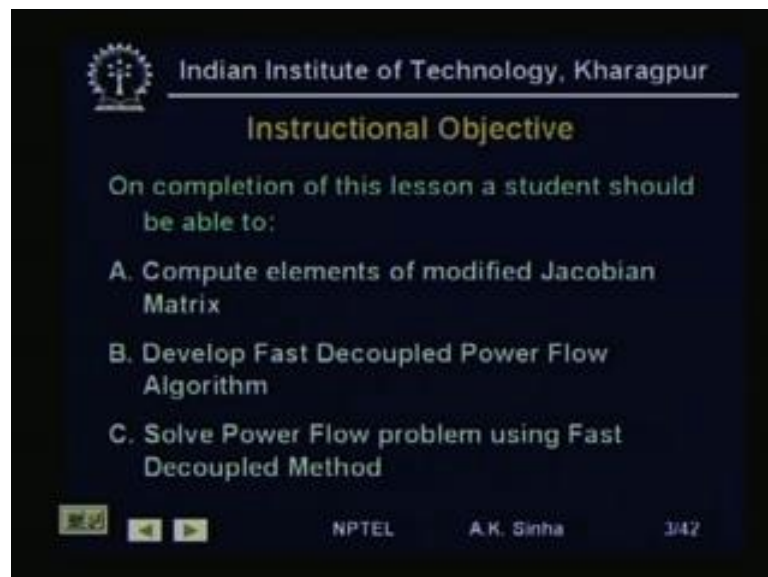

Lesson Summary

1. Computation Aspects for N-R Method
2. Algorithm for Fast Decoupled Power Flow
3. Example

NPTEL A.K. Sinha 2/42

We will start with computations and computational aspects of Newton-Raphson load flow method. Then we will develop fast decoupled power flow algorithm and we will take up an example for solving the fast decoupled power flow problem.

(Refer Slide Time: 55:47)

The slide features the IIT Kharagpur logo and name at the top. The title 'Instructional Objective' is centered. Below it, the text 'On completion of this lesson a student should be able to:' is followed by a list of three objectives labeled A, B, and C. At the bottom, there are navigation icons, the text 'NPTEL A.K. Sinha', and the slide number '3/42'.

Indian Institute of Technology, Kharagpur

Instructional Objective

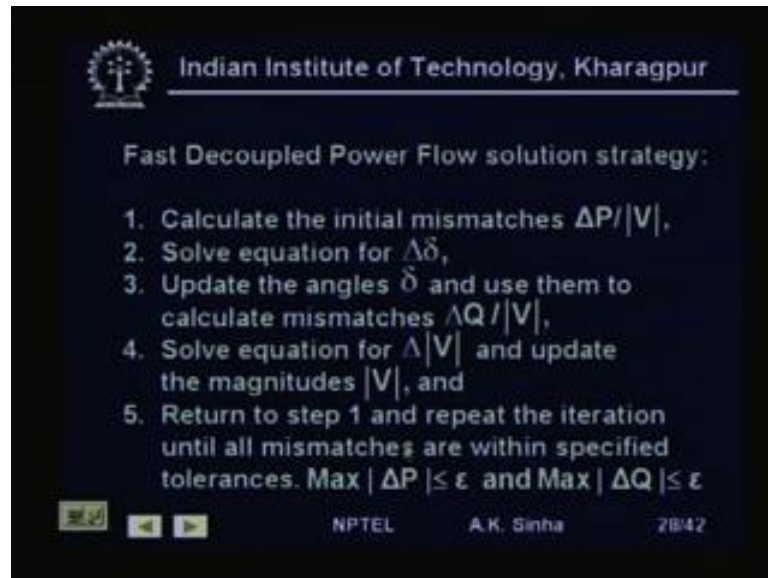

On completion of this lesson a student should be able to:

- A. Compute elements of modified Jacobian Matrix
- B. Develop Fast Decoupled Power Flow Algorithm
- C. Solve Power Flow problem using Fast Decoupled Method

NPTEL A.K. Sinha 3/42

On the completion of this lesson, you should be able to compute elements of the modified Jacobian matrix. Develop, fast decoupled power flow algorithm and solve power flow problem using fast decoupled method.

(Refer Slide Time: 56:03)

Indian Institute of Technology, Kharagpur

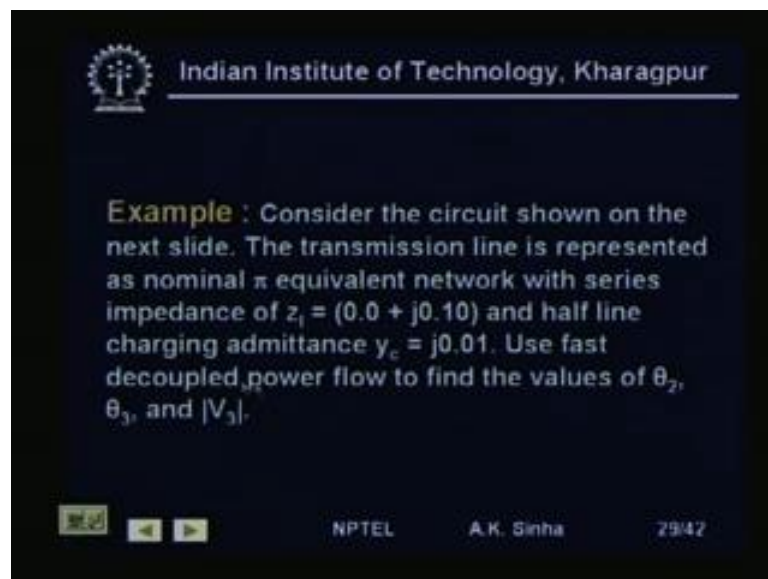

Fast Decoupled Power Flow solution strategy:

1. Calculate the initial mismatches $\Delta P/|V|$.
2. Solve equation for $\Delta\delta$.
3. Update the angles δ and use them to calculate mismatches $\Delta Q/|V|$.
4. Solve equation for $\Delta|V|$ and update the magnitudes $|V|$, and
5. Return to step 1 and repeat the iteration until all mismatches are within specified tolerances. $\text{Max } |\Delta P| \leq \epsilon$ and $\text{Max } |\Delta Q| \leq \epsilon$

NPTEL A.K. Sinha 7B42

Now, we will take one example, for solving a power flow using fast decoupled method.

(Refer Slide Time: 56:06)

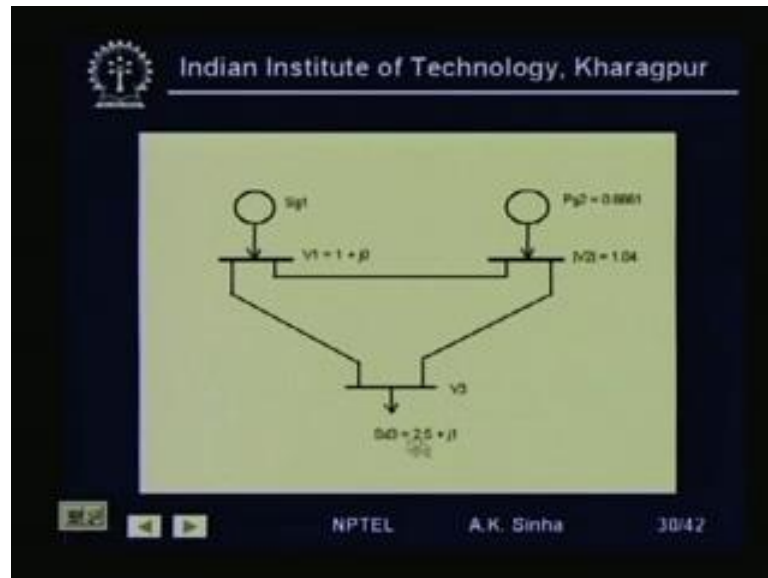

Indian Institute of Technology, Kharagpur

Example : Consider the circuit shown on the next slide. The transmission line is represented as nominal π equivalent network with series impedance of $z_l = (0.0 + j0.10)$ and half line charging admittance $y_c = j0.01$. Use fast decoupled power flow to find the values of θ_2 , θ_3 , and $|V_3|$.

NPTEL A.K. Sinha 7B42

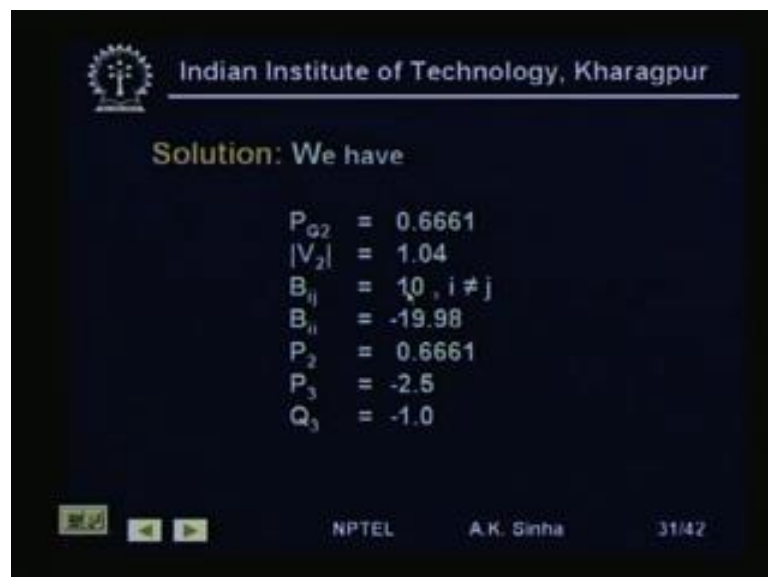

So, consider the circuit shown on the next slide, the transmission line is represented as nominal pi equivalent network, with series impedance Z_l is equal to $0.0 + j, 0.1$ and half line charging admittance Y_c is equal to $j 0.1, 0.01$. Using fast decoupled power flow, find the values of θ_2 , θ_3 and V_3 .

(Refer Slide Time: 56:42)

Now, if we see this system, this is a three bus system. This bus 1 is a slack bus, where the voltage is specified as one angle 0. That is 1 plus j 0, bus 2 is a P V bus, where we have the real power injection given as 0.6661 per unit and the voltage magnitude at this bus is given as 1.04 per unit. Bus 3 is a P Q bus, where the load value is given as 2.5 plus j 1.

(Refer Slide Time: 57:21)

Now, using the transmission line impedance values, we have got B_{ij} is equal to 10 for $i \neq j$ that is $B_{12}, B_{13}, B_{23}, B_{32}$. All these terms will be equal to 10,

because it is equal to $1 \text{ by } 0.1, 1 \text{ by } 0.1 \text{ j } 0.1$. So, that becomes minus $J 10$ and $B i i$ is equal to minus 19.98 , because we add all the susceptances connected to the bus, plus this half line charging of the two lines at that bus.

Thank you very much.
