**Department of Electrical Engineering**  
**Indian Institute of Technology, Kharagpur**

**Lecture - 20**  
**Power Flow – V**

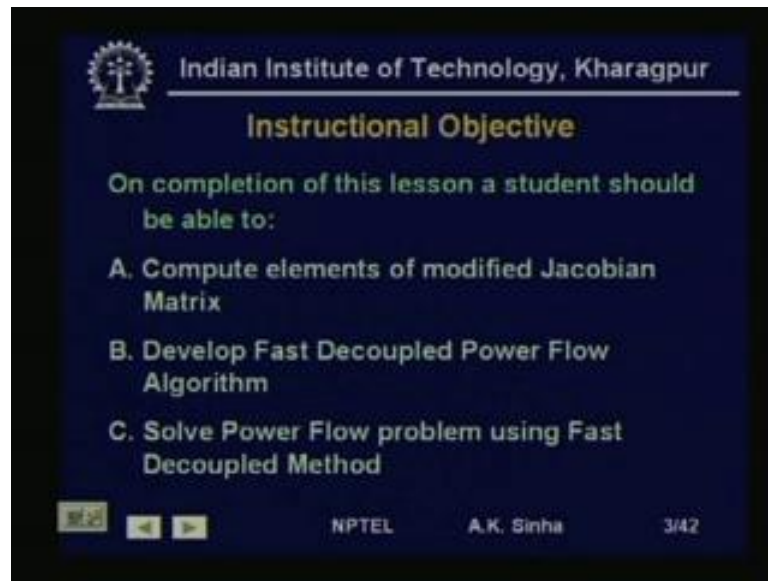

Welcome to lesson 20 on Power System Analysis. In this lesson, we will continue with the Power Flow Analysis.

(Refer Slide Time: 00:54)

We will start with computational some computational aspects of Newton Raphson load flow method. Then we will develop fast decouple power flow algorithm and we will take up an example for solving fast decoupled power flow problem.

(Refer Slide Time: 01:19)

Indian Institute of Technology, Kharagpur

### Instructional Objective

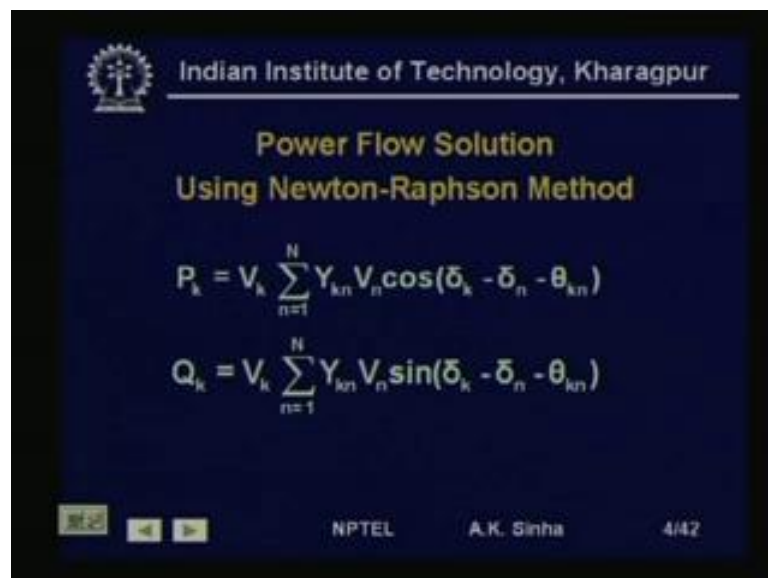

On completion of this lesson a student should be able to:

- A. Compute elements of modified Jacobian Matrix
- B. Develop Fast Decoupled Power Flow Algorithm
- C. Solve Power Flow problem using Fast Decoupled Method

NPTEL A.K. Sinha 3/42

On the completion of this lesson you should be able to compute elements of the modified Jacobian matrix. Develop fast decoupled power flow algorithm and solve power flow problem using fast decoupled method.

Indian Institute of Technology, Kharagpur

### Power Flow Solution Using Newton-Raphson Method

$$P_k = V_k \sum_{n=1}^N Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$
$$Q_k = V_k \sum_{n=1}^N Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$$

NPTEL A.K. Sinha 4/42

We will start with the power flow equations that we had developed earlier, where we had said that a power real power injection at any bus  $k$  is given by  $P_k$ . And  $P_k$  is equal to  $V_k \sum_{n=1}^N Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$ , where  $V_k$  and  $V_n$  are the voltage magnitudes at bus  $k$  and  $n$ ,  $\delta_k$  is the voltage phase angle at bus  $k$ ,  $\delta_n$  is the voltage phase angle at bus  $n$ . And  $\theta_{kn}$  is the angle

of the admittance between bus k n n. That is the angle associated with the element Y k n. That is k n element of the Y bus matrix and Y k n is the magnitude of that element. Similarly, the reactive power injection at bus k is given by the relationship Q k is equal to V k summation n is equal to 1 to capital N Y k n, V n sin delta k minus delta n minus theta k n.

(Refer Slide Time: 03:10)

Indian Institute of Technology, Kharagpur

$$\begin{bmatrix} \Delta P^{(i)} \\ \Delta Q^{(i)} \end{bmatrix} = \begin{bmatrix} P^{sp} - P^{cal} \\ Q^{sp} - Q^{cal} \end{bmatrix} \left[ X^{(i)} \right]$$

$$\begin{bmatrix} J_1^{(i)} & J_2^{(i)} \\ J_3^{(i)} & J_4^{(i)} \end{bmatrix} \begin{bmatrix} \Delta \delta^{(i)} \\ \Delta V^{(i)} \end{bmatrix} = \begin{bmatrix} \Delta P^{(i)} \\ \Delta Q^{(i)} \end{bmatrix}$$

$$X^{(i+1)} = \begin{bmatrix} \delta^{(i+1)} \\ V^{(i+1)} \end{bmatrix} = \begin{bmatrix} \delta^{(i)} \\ V^{(i)} \end{bmatrix} + \begin{bmatrix} \Delta \delta^{(i)} \\ \Delta V^{(i)} \end{bmatrix}$$

NPTEL A.K. Sinha 5/42

We from these relationships for Newton Raphson load flow. We had developed the model, where J into delta X is equal to delta P delta Q; where delta P delta Q matrix are the vector is given by P specified minus P calculated which is a function of the state variables at i th iteration. So, this state variable as we have already discussed are the voltage phase angles and the magnitude value at all the buses.

Similarly, delta Q i that is the change in Q at i th iteration is equal to Q specified value minus Q calculated value, which is a function of the state variables. So, state variable delta delta and delta V is solved using this relationship where J 1 J 2 J 3 J 4 are the sub matrices of the Jacobian matrix. J 1 is del P by del delta terms, J 2 is del P by del V terms, J 3 is del Q by del delta terms and J 4 is del Q by del V terms.

So, now this calculated value is computed and then delta P delta Q is calculated. That is put here J 1 J 2 J 3 J 4 are computed at the ith iteration state variable values. So, once we know this matrix, we know this using the solution for this linear system of equations a x is equal to b kind of a system. We can solve for this X and this X is given by this.

So, once we get this  $X$  at  $\delta X$  at  $i$ th iteration, then we can find out  $X$  at  $I$  plus 1th iteration. As that is  $\delta$  at  $I$  plus 1th iteration and  $V$  at  $I$  plus 1th iteration is equal to whatever was the value of  $\delta$ . And  $V$  at  $i$ th iteration plus the change which we have computed just now, that is  $\delta \delta$  at  $i$ th iteration and  $\delta V$  at  $i$ th iteration.

(Refer Slide Time: 05:50)

Indian Institute of Technology, Kharagpur

$$J^{(i)} = \begin{array}{c|c} \begin{array}{c} J1 \\ \frac{\partial P_2}{\partial \delta_2} \dots \frac{\partial P_2}{\partial \delta_N} \\ \vdots \\ \frac{\partial P_N}{\partial \delta_2} \dots \frac{\partial P_N}{\partial \delta_N} \end{array} & \begin{array}{c} J2 \\ \frac{\partial P_2}{\partial V_2} \dots \frac{\partial P_2}{\partial V_N} \\ \vdots \\ \frac{\partial P_N}{\partial V_2} \dots \frac{\partial P_N}{\partial V_N} \end{array} \\ \hline \begin{array}{c} J3 \\ \frac{\partial Q_2}{\partial \delta_2} \dots \frac{\partial Q_2}{\partial \delta_N} \\ \vdots \\ \frac{\partial Q_N}{\partial \delta_2} \dots \frac{\partial Q_N}{\partial \delta_N} \end{array} & \begin{array}{c} J4 \\ \frac{\partial Q_2}{\partial V_2} \dots \frac{\partial Q_2}{\partial V_N} \\ \vdots \\ \frac{\partial Q_N}{\partial V_2} \dots \frac{\partial Q_N}{\partial V_N} \end{array} \end{array} X - X^{(i)}$$

NPTEL A.K. Sinha 6/42

The Jacobian matrix as I said earlier is this  $J$  1 is  $\frac{\partial P}{\partial \delta}$  sub matrix  $J$  2 is  $\frac{\partial P}{\partial V}$  sub matrix.  $J$  3 is  $\frac{\partial Q}{\partial \delta}$  sub matrix and  $J$  4 is  $\frac{\partial Q}{\partial V}$  sub matrix. At the values are computed at  $i$ th iteration by substituting the value of the state variables at  $i$ th iteration.

(Refer Slide Time: 06:21)

Indian Institute of Technology, Kharagpur

$$n = k$$

$$J1_{kk} = \frac{\partial P_k}{\partial \delta_k} = -V_k \sum_{n=1, n \neq k}^N Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn}) = -Q_k - V_k^2 B_{kk}$$

$$J2_{kk} = \frac{\partial P_k}{\partial V_k} = V_k Y_{kk} \cos \theta_{kk} + \sum_{n=1}^N Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$

$$J3_{kk} = \frac{\partial Q_k}{\partial \delta_k} = V_k \sum_{n=1, n \neq k}^N Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$

$$J4_{kk} = \frac{\partial Q_k}{\partial V_k} = -V_k Y_{kk} \sin \theta_{kk} + \sum_{n=1}^N Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn}) + Q_k - V_k^2 B_{kk}$$

NPTEL A.K. Sinha 7/42

Now, we can calculate the elements of the Jacobian matrix, this we had done in the earlier lesson. So, for the diagonal elements for J 1 that is  $\frac{\partial P_k}{\partial \delta_k}$  we have the relationship as.  $\frac{\partial P_k}{\partial \delta_k}$  is equal to minus  $V_k \sum_{n=1}^{n \neq k} Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$  to capital N, where n is not equal to k.

So, that is into  $Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$ . This comes out to be equal to minus  $Q_k$  minus  $V_k^2$  into  $B_{kk}$ . Similarly, J 2 sub matrix the diagonal elements  $\frac{\partial P_k}{\partial V_k}$  is computed as  $V_k Y_{kk} \cos(\theta_{kk})$  plus  $\sum_{n=1}^{n \neq k} Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$ .

J 3 k k that is diagonal elements of J 3 sub matrix  $\frac{\partial Q_k}{\partial \delta_k}$  is given by  $V_k \sum_{n=1}^{n \neq k} Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$ . And J 4 k k that is diagonal elements of J 4  $\frac{\partial Q_k}{\partial V_k}$  is equal to minus  $V_k Y_{kk} \sin(\theta_{kk})$  plus  $\sum_{n=1}^{n \neq k} Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$ . This is equal to  $Q_k$  minus  $V_k^2 B_{kk}$ .

(Refer Slide Time: 08:23)

Indian Institute of Technology, Kharagpur

$n \neq k$

$$J1_{kn} = \frac{\partial P_k}{\partial \delta_n} = V_k Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$$

$$J2_{kn} = \frac{\partial P_k}{\partial V_n} = V_k Y_{kn} \cos(\delta_k - \delta_n - \theta_{kn})$$

$$J3_{kn} = \frac{\partial Q_k}{\partial \delta_n} = -V_k Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$

$$J4_{kn} = \frac{\partial Q_k}{\partial V_n} = V_k Y_{kn} \sin(\delta_k - \delta_n - \theta_{kn})$$

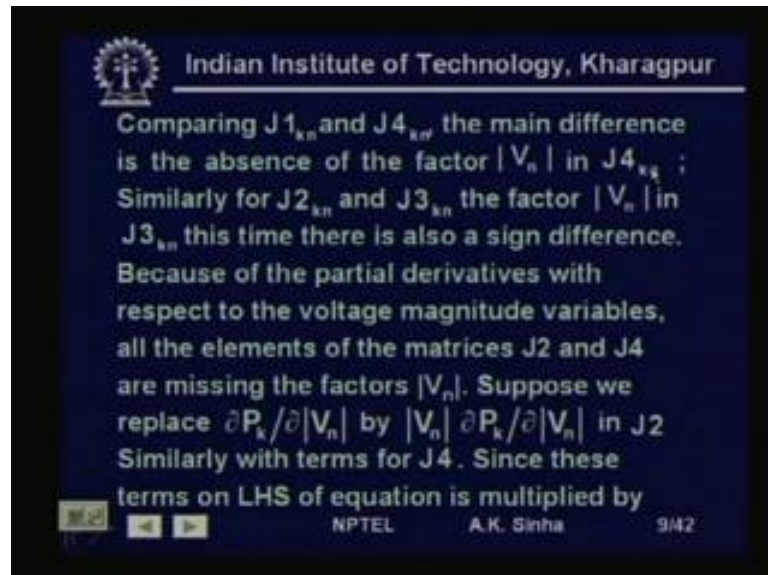

NPTEL A.K. Sinha 8/42

The off diagonal terms or obtained in like this J 1 k n that is off diagonal terms of J 1  $\frac{\partial P_k}{\partial \delta_n}$  this is given by  $V_k Y_{kn} \sin(\delta_k - \delta_n - \theta_{kn})$ . The off diagonal terms of sub matrix J 2 is given by  $\frac{\partial P_k}{\partial V_n}$  is equal to  $V_k Y_{kn} \cos(\delta_k - \delta_n - \theta_{kn})$ .

Similarly, the off diagonal terms of J 3 sub matrix  $\frac{\partial Q_k}{\partial \delta_n}$  is given by minus  $V_k$  into  $Y_{kn}$  minus  $V_n \cos(\delta_k - \delta_n - \theta_{kn})$ . And the off

diagonal terms of  $J_{4 \times 4}$  sub matrix  $\frac{\partial Q_k}{\partial V_n}$  is given by  $V_k Y_{kn} \sin(\delta_k - \delta_n - \theta_{kn})$ . Now, if we see these, the elements of the off diagonal elements of the Jacobian matrix as well as the diagonal elements of the Jacobian matrix; we find some similarity in the terms.

(Refer Slide Time: 09:42)

We will see how we can take advantage of these similarities. Now, comparing term for  $J_{1_{kn}}$  and  $J_{4_{kn}}$ . The main difference is the absence of factor,  $V_n$  that is the magnitude value of voltage at  $n$ th bus in  $J_{4_{kn}}$ . That is if we see here  $J_{4_{kn}}$  and  $J_{1_{kn}}$  are very similar expect that this  $V_n$  term is not present in this.

Similarly, if we see  $J_2$  and  $J_3$  again we find that  $J_2$  is missing  $V_n$ . Whereas, this  $J_2$  and  $J_3$  are very similar expect that  $J_2$  is missing this  $V_n$ . Also there is a  $\sin$  minus  $\sin$  associated with  $J_3$ . Now, if we can take advantage of these similarities our computation for the Jacobian matrix can be made much simpler.

Now, this difference is coming why. The difference is coming mainly because the partial derivatives with respect to the voltage magnitude variables. All the elements of matrices  $J_2$  and  $J_4$  are missing the factor  $V_n$ . That is since these  $J_2$  and  $J_4$  are partial derivatives with respect to the voltage magnitudes. Therefore, the voltage magnitude term are missing in  $J_2$  and  $J_4$ .

Now, suppose we replace this  $\frac{\partial P_k}{\partial |V_n|}$  by  $\frac{\partial P_k}{\partial V_n}$  by multiplying it by  $V_n$ . That is the magnitude value  $V_n$ . So, we replace this by  $V_n$  into  $\frac{\partial P_k}{\partial V_n}$  in  $J_2$ . Similarly,

for terms for J 4 can also be multiplied by  $V_n$ . And since these terms are on the left hand side of the equation is multiplied by  $V_n$ 's.

(Refer Slide Time: 11:53)

Indian Institute of Technology, Kharagpur

$|V_n|$ 's corresponding terms in the update vectors should be divided by the appropriate  $|V_n|$ 's in order to maintain the specified relationship.

$$|V_n| \frac{\partial Q_k}{\partial |V_n|} \times \frac{\Delta |V_n|}{|V_n|} = \frac{\partial Q_k}{\partial |V_n|} \times \Delta |V_n|$$

Modified Jacobian element      Modified update term      Original Jacobian element      Original update term

NPTEL      A.K. Sinha      10/42

I am sorry this should be  $V_n$ 's the corresponding terms in the update vectors should be divided by the appropriate  $V_n$ 's in order to maintain the specified relationship. That is what we have done is  $\frac{\partial Q_k}{\partial |V_n|}$  we have multiplied by  $V_n$  right. So, what we are doing we will this  $\Delta |V_n|$  term, we will divide by  $V_n$ .

So, then what we will get, will be  $\frac{\partial Q_k}{\partial |V_n|}$  into  $\Delta |V_n|$ , which is the same term as the original matrix. So, what we are doing we are multiplying the terms of the J 4 matrix by  $V_n$ . Similarly, multiplying the terms of J 1, J 2 sub matrix with  $V_n$ . We will divide this  $\Delta |V_n|$  term by  $V_n$ , then we get the same relationship. So, the relationship or the equation is maintained by multiplying the J 2 and J 4 terms with  $V_n$  and dividing  $\Delta |V_n|$  by  $V_n$ .

(Refer Slide Time: 13:11)

Indian Institute of Technology, Kharagpur

$$\begin{bmatrix} \Delta P(x^m) \\ \Delta Q(x^m) \end{bmatrix} = \begin{bmatrix} H^m & N^m \\ M^m & L^m \end{bmatrix} \begin{bmatrix} \Delta \delta^m \\ \frac{\Delta |V|^m}{|V|^m} \end{bmatrix}$$

Here  $H = J_1$ ,  $M = J_3$ ,  $N = J_2 [V]$ ,  $L = J_4 [V]$ ,  
and we define

NPTEL A.K. Sinha 11/42

Therefore the relationship now comes out between  $\Delta P$  and  $\Delta Q$  at with the at  $m$ th iteration that is with the values substituted for  $X$ , which is  $\Delta \delta$  and  $\Delta V$ ; which is  $V$  and  $\Delta$  angles. So,  $X$  is  $V$  and  $\Delta$ . So, substituting the value for that in the equation for  $P$  and  $Q$ . So, we will get  $P$  specified minus  $P$  calculated and that will give me  $\Delta P$  and  $\Delta Q$  at that state with that state variable.

And the Jacobian now we have renamed, because we have multiplied the elements of  $J_2$  and  $J_4$  by  $V$ . So, we have renamed these sub matrices as  $HNM$  and  $L$ , where  $H$  is same as  $J_1$ ,  $M$  is same as  $J_3$ ,  $N$  is  $J_2$  multiplied by  $V$  and  $L$  is also  $J_4$  multiplied by  $V$ . And also in the term  $\Delta \delta$  remain same but this term  $\Delta V$ , which was there is now divided by magnitude  $V$ , because we have multiplied the terms of  $J_2$  and  $J_4$  by this  $V$ .

(Refer Slide Time: 14:40)

Indian Institute of Technology, Kharagpur

$$[V] \triangleq \begin{bmatrix} |V_2| & 0 & \dots & 0 \\ \vdots & |V_3| & & \vdots \\ \vdots & \vdots & \ddots & \vdots \\ 0 & \dots & \dots & |V_n| \end{bmatrix}, \quad \frac{\Delta|V|}{|V|} \triangleq \begin{bmatrix} \frac{\Delta|V_2|}{|V_2|} \\ \vdots \\ \frac{\Delta|V_n|}{|V_n|} \end{bmatrix}$$

NPTEL A.K. Sinha 12/42

So, if we do this then we have where  $V$  we are saying is the, if you look at this  $J$  into  $V$  actually this  $V$  is basically a diagonal matrix of voltage magnitudes. Therefore this  $V$  is defined as  $V_2 V_3 V_4$ , here we are assuming that bus 1 is our slack bus that is what we had been using from very beginning. So, bus 1 is considered a slack bus. So,  $V$  is  $V_2 V_3$  up to  $V_n$  and  $\Delta V$  by  $V$  is  $\Delta V_2$  by  $V_2$  and so on,  $\Delta V_n$  by  $V_n$ .

(Refer Slide Time: 15:27)

Indian Institute of Technology, Kharagpur

$$\Delta\delta^m \text{ and } \frac{\Delta|V|^m}{|V|^m}$$

$$\delta_i^{m+1} = \delta_i^m + \Delta\delta_i^m$$

$$|V_i|^{m+1} = |V_i|^m \left( 1 + \frac{\Delta|V_i|^m}{|V_i|^m} \right)$$

NPTEL A.K. Sinha 13/42

So, this is what we get. Then what happens is we have, now if you look at this we are calculating these terms. We know this we have got the values of this by substituting the value of state variables that is voltage magnitude and angle for the elements of the

Jacobian. Then solving this expression we can calculate  $\Delta \delta_m$  and  $\Delta V_m$  by  $V_m$ .

So, once we have calculated this, then we can get the updated value for  $m+1$ th iteration as  $\Delta I$ . That is  $\Delta \delta$  at  $i$ th bus for  $m+1$ th iteration is equal to  $\Delta I$  at  $m$ th iteration plus  $\Delta \delta I$  at  $m$ th iteration. And similarly the voltage magnitude is updated as  $V_i$  at  $m+1$ th iteration is equal to  $V_i$  at  $m$ th iteration into  $1 + \Delta V_i$  by  $V_i$  at  $m$ th iteration. So, this is the update that we do. Now, if you look at this, what we have done here is we have modified our Jacobian matrix terms in such a way that we do not need to compute all the terms.

(Refer Slide Time: 17:00)

Indian Institute of Technology, Kharagpur

Comparing  $J1_{V_n}$  and  $J4_{V_n}$  the main difference is the absence of the factor  $|V_n|$  in  $J4_{V_n}$ ; Similarly for  $J2_{V_n}$  and  $J3_{V_n}$  the factor  $|V_n|$  in  $J3_{V_n}$  this time there is also a sign difference. Because of the partial derivatives with respect to the voltage magnitude variables, all the elements of the matrices  $J2$  and  $J4$  are missing the factors  $|V_n|$ . Suppose we replace  $\partial P_k / \partial |V_n|$  by  $|V_n| \partial P_k / \partial |V_n|$  in  $J2$  Similarly with terms for  $J4$ . Since these terms on LHS of equation is multiplied by

NPTEL A.K. Sinha 9/42

That is we have  $J1$ , if you compute the  $J1$  terms we have also computed the  $J4$  terms.

(Refer Slide Time: 17:20)

Indian Institute of Technology, Kharagpur

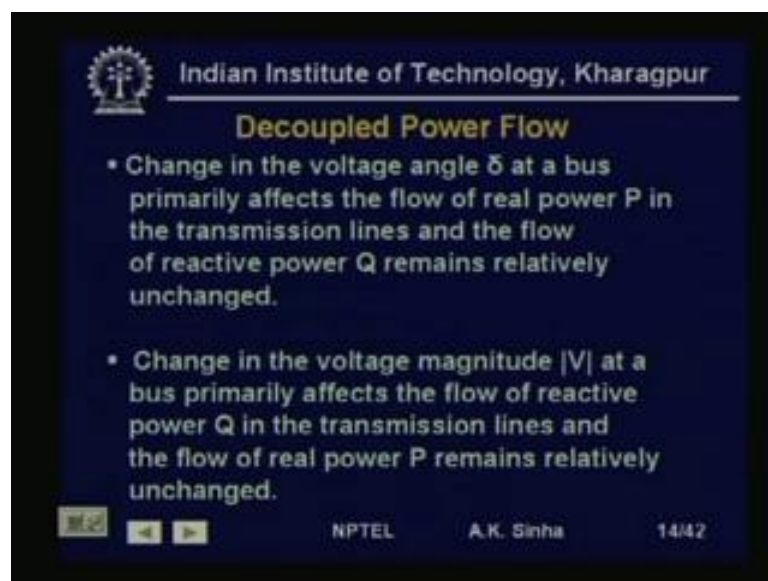

$n \neq k$

$$J1_{kn} = \frac{\partial P_k}{\partial \delta_n} = V_k Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$$
$$J2_{kn} = \frac{\partial P_k}{\partial V_n} = V_k Y_{kn} \cos(\delta_k - \delta_n - \theta_{kn})$$
$$J3_{kn} = \frac{\partial Q_k}{\partial \delta_n} = -V_k Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$
$$J4_{kn} = \frac{\partial Q_k}{\partial V_n} = V_k Y_{kn} \sin(\delta_k - \delta_n - \theta_{kn})$$

NPTEL A.K. Sinha BI/42

Now, similarly if we have computed the J 2 terms, then we also have computed the J 3 terms, here there is a mistake it should be J 3. This is J 2 terms, then we also have computed the J 3 terms if we have used this modification that is we have multiplied the J 2 and J 4 terms by the voltage magnitudes. So, this a great advantage, because you do not need to compute a large number of elements of the Jacobian matrix. So, this speeds up the computation for the Newton Raphson method considerably.

(Refer Slide Time: 18:01)

Indian Institute of Technology, Kharagpur

### Decoupled Power Flow

- Change in the voltage angle  $\delta$  at a bus primarily affects the flow of real power P in the transmission lines and the flow of reactive power Q remains relatively unchanged.
- Change in the voltage magnitude |V| at a bus primarily affects the flow of reactive power Q in the transmission lines and the flow of real power P remains relatively unchanged.

NPTEL A.K. Sinha 14/42

Now, still Newton Raphson method requires enormous amount of computation though we use techniques for improving the computational efficiency of the Newton Raphson

method. Because we know that the Jacobian matrix there are large number of elements which will be zero. So, we use sparsity techniques for solving this. We will discuss some of the spars method techniques in the next lessons. There is still some chance for improving the computational aspect of the power flow problem. And these we can do by seek the some of the practical aspects associate with the power flow equations.

(Refer Slide Time: 19:07)

Indian Institute of Technology, Kharagpur

### Decoupled Power Flow

- Change in the voltage angle  $\delta$  at a bus primarily affects the flow of real power  $P$  in the transmission lines and the flow of reactive power  $Q$  remains relatively unchanged.
- Change in the voltage magnitude  $|V|$  at a bus primarily affects the flow of reactive power  $Q$  in the transmission lines and the flow of real power  $P$  remains relatively unchanged.

NPTEL A.K. Sinha 14/42

We know that change in voltage angle  $\delta$  at a bus primarily affects the real power  $P$  in the transmission lines. That is  $\delta$  primarily affects the real power flow in the transmission lines. Whereas the reactive power flows remain more or less unchanged. Same thing, if you see that, if you change the voltage magnitude. Then the reactive power flow on the transmission line get changed, but the real power flow remains more or less unchanged.

This shows that  $P$   $\delta$ , the  $P$  and  $\delta$  are strongly length and  $Q$  and  $V$  are strongly length. And there is a weak coupling between  $P$   $\delta$  and  $Q$   $V$ . And we can take advantage of this property of the power system in trying to improve the computational aspect of the power flow problem.

(Refer Slide Time: 20:12)

Indian Institute of Technology, Kharagpur

$$J(x^m) = \begin{bmatrix} J1^m & J2^m \\ J3^m & J4^m \end{bmatrix}$$

$$J(x^m) = \begin{bmatrix} J1^m & 0 \\ 0 & J4^m \end{bmatrix}$$

$$J1^m \Delta \delta^m = \Delta P(x^m)$$

$$J4^m \Delta |V|^m = \Delta Q(x^m)$$

NPTEL A.K. Sinha 15/42

And if we do that, that is if we see the Jacobian matrix the Jacobian matrix  $J_1 J_2 J_3 J_4$ . If we see this we can also see since there is weak coupling between P and V that is the voltage magnitude. We find that the elements of this  $J_2$  sub matrix which is basically providing the sensitivity of real power with respect voltage magnitude.

And similarly the elements of the  $J_3$  sub matrix, which is providing which  $\Delta Q$  by  $\Delta \delta$ . That is sensitivity of reactive power with respect to the voltage phase angle. These the elements of these sub matrices  $J_2$  and  $J_3$  are much smaller compared to the elements of  $J_1$  and  $J_4$ .

This also tells us the same thing, that there is a strong coupling between P and  $\delta$  and Q and V and a V coupling between P and V and Q and  $\delta$ . And therefore, if we try to take advantage of this weak couplings, we can neglect the sub matrices  $J_2$  and  $J_3$  that is we can make them zero. So, we have now the Jacobian matrix consisting of sub matrix  $J_1$  and  $J_4$  only.

If that is the case, then we have the equations written as  $J_1 \Delta \delta = \Delta P$ . That is if you look at this equation, since we have made these sub matrices 0. So,  $\Delta P$  is equal to  $H$  into  $\Delta \delta$  or  $J_1$  into  $\Delta \delta$ . And  $\Delta Q$  is equal to  $L$  into  $\Delta V$  or  $J_4$  into  $\Delta V$  or  $L$  into  $\Delta V$ .

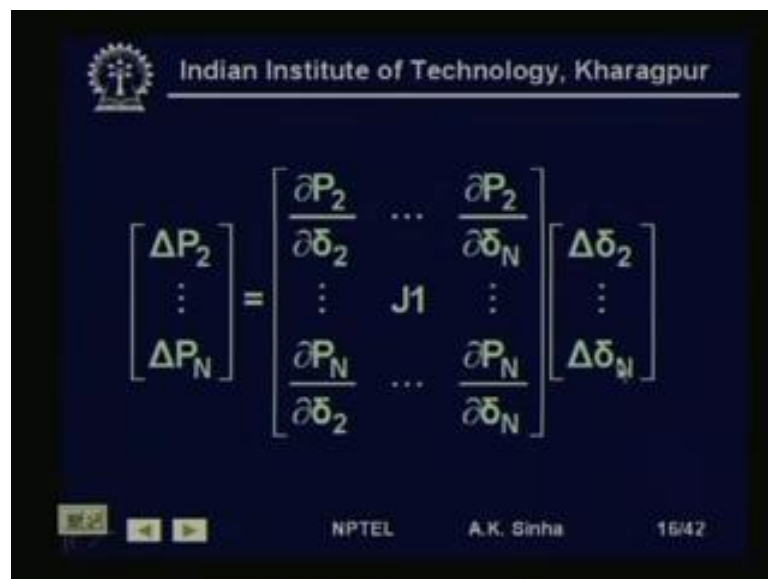

So, what we see? Now, what has happened is the set of equation that is, if you assume that there is no PV bus. Then we have  $2n - 1$  set of equations and the Jacobian matrices  $2n - 1$  into  $2n - 1$  matrix. Now, here what has happened is.

Now, this J 1 term is only there, which is n minus 1 into n minus 1 matrix. And J 4 term is there which is again n minus 1 into n minus 1 matrix if you assume no PV buses.

Then what we have seen is this whole problem, which was a 2 n 2 into n minus 1 simultaneous equation has been broken into 2 n minus 1 simultaneous equations. And this considerably reduces the computational aspect, because now our Jacobian matrices are much smaller and solving for these takes much less time. Because as we had talked about earlier, that the time taken for solving the X is equal to B matrix or the equation using Gauss elimination or some other method is proportional to n square additions and multiplications.

So, the time take is proportional to n square. So, now instead of 2 n square which is 4 n squared. Now, we are solving n squared plus n square that is 2 n squared. So, the computational aspect we again considerably; that is now we require only half the amount of computation in this case.

(Refer Slide Time: 24:41)

The slide displays the following equation:

$$\begin{bmatrix} \Delta P_2 \\ \vdots \\ \Delta P_N \end{bmatrix} = \begin{bmatrix} \frac{\partial P_2}{\partial \delta_2} & \dots & \frac{\partial P_2}{\partial \delta_N} \\ \vdots & J1 & \vdots \\ \frac{\partial P_N}{\partial \delta_2} & \dots & \frac{\partial P_N}{\partial \delta_N} \end{bmatrix} \begin{bmatrix} \Delta \delta_2 \\ \vdots \\ \Delta \delta_N \end{bmatrix}$$

The slide also includes the IIT Kharagpur logo and the text "Indian Institute of Technology, Kharagpur" at the top. At the bottom, it shows "NPTEL A.K. Sinha 16/42".

So, now we have the relationship for the decoupled equations as delta P from bus 2 to bus N is equal to this sub matrix J 1 into delta delta from delta 2 to delta delta N.

(Refer Slide Time: 24:58)

Indian Institute of Technology, Kharagpur

$$\begin{bmatrix} |V_2| \frac{\partial Q_2}{\partial |V_2|} & \dots & |V_N| \frac{\partial Q_2}{\partial |V_N|} \\ \vdots & J_4 & \vdots \\ |V_2| \frac{\partial Q_N}{\partial |V_2|} & \dots & |V_N| \frac{\partial Q_N}{\partial |V_N|} \end{bmatrix} \begin{bmatrix} \Delta V_2 \\ |V_2| \\ \vdots \\ \Delta V_N \\ |V_N| \end{bmatrix} = \begin{bmatrix} \Delta Q_2 \\ \vdots \\ \Delta Q_N \end{bmatrix}$$

NPTEL A.K. Sinha 17/42

And for this the other set of equation is again this will be the sub matrix L, which we are using, because we have multiplied del Q by del V by V. So, here we have del V 2 by V 2 and del V N by V N and this is del Q. So, this is the other set of equation that we need to solve.

(Refer Slide Time: 25:29)

### Fast Decoupled Power Flow

In a well-designed and properly operated power transmission system:

- The angular differences  $(\delta_i - \delta_j)$  between typical buses of the system are usually so small that

$$\cos(\delta_i - \delta_j) = 1; \quad \sin(\delta_i - \delta_j) \approx (\delta_i - \delta_j)$$

NPTEL A.K. Sinha 18/42

So, now the advantage of this method of decoupling has been that the computational aspect has been reduced considerably. But, we when trying to solve this we find that the number of iterations required for this, increases considerably and in many cases there are convergence difficulties. So, this does not really help much.

So, some other improvements looking at the physical aspects of the power system was suggested in form of a fast decoupled power flow method. Now, what how this method was developed is based on certain assumptions, which are valid for a properly operated power system. So, in a well designed and properly operated power transmission system the angular differences, that is delta I minus delta j between typical buses of a system are usually small.

They are small, so we have cos delta I minus delta j is equal to 1. Normally this angle difference will be of the order of 10 to 15 degrees maximum most of the time less than that also. So, we have therefore cos delta I minus delta j very nearly equal to 1. And sin delta I minus delta j is approximately equal to delta I minus delta j radian.

(Refer Slide Time: 27:10)

Indian Institute of Technology, Kharagpur

- The line susceptances  $B_{ij}$  are many times larger than the line conductances  $G_{ij}$  so that
 
$$G_{ij} \sin(\delta_i - \delta_j) \ll B_{ij} \cos(\delta_i - \delta_j)$$
- The reactive power  $Q_i$  injected into any bus  $i$  of the system during normal operation is much less than the reactive power which would flow if all lines from that bus were short-circuited to reference. That is,
 
$$Q_i \ll |V_i|^2 B_{ii}$$

NPTEL A.K. Sinha 19/42

Also the line susceptances  $B_{ij}$  are many times larger than the line conductance  $G_{ij}$ . That is true, because we know that the inductance of the transmission line is much larger than the resistance; and therefore,  $B_{ij}$  is much larger than  $G_{ij}$ . Therefore we can say that  $G_{ij} \sin \delta_i - \delta_j$  is much smaller than  $B_{ij} \cos \delta_i - \delta_j$ . Because this term will be more or less very near to 1. So, this term will be  $B_{ij}$  and  $G_{ij}$  is much smaller and  $\sin \delta_i - \delta_j$  is equal to  $\delta_i - \delta_j$  radian only. Therefore this whole term is much smaller than this term and therefore, this can be neglected in comparison with this term.

Now, the reactive power  $Q_i$  injected into a bus  $i$  of the system during normal operation is much less than the reactive power, which would flow if all the lines from that bus were

short circuited to reference. That is if we short circuit that bus to the reference, what is the reactive power which will flow. It will be the voltage square multiplied by  $B_{ii}$ .

So,  $V_i^2$  into  $B_{ii}$  is what will be flowing when we short circuit that bus to the reference. Whereas  $Q_i$ , which is the injected reactive power at that bus is certainly much smaller in normal operating time. Therefore  $Q_i$  is much smaller than  $V_i^2$  into  $B_{ii}$ .

(Refer Slide Time: 29:08)

The slide features the IIT Kharagpur logo and text at the top. The main title is "Power Flow Solution Using Newton-Raphson Method". Below the title, two equations are displayed for active power  $P_k$  and reactive power  $Q_k$  at bus  $k$ . The equations are:

$$P_k = V_k \sum_{n=1}^N Y_{kn} V_n \cos(\delta_k - \delta_n - \theta_{kn})$$
$$Q_k = V_k \sum_{n=1}^N Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$$

At the bottom of the slide, there are navigation icons, the text "NPTEL", the name "A.K. Sinha", and the slide number "4/42".

In fact, this we can also see from this relationship where  $Q_k$  is given as  $V_k$  into  $Y_{kn} V_n \sin(\delta_k - \delta_n - \theta_{kn})$ . Now, this  $Y_{kn} \sin(\delta_k - \delta_n - \theta_{kn})$  terms will give me the  $V$  terms. Whereas let me go back and see this from another equation.

(Refer Slide Time: 29:53)

Indian Institute of Technology, Kharagpur

- These approximations can be used to simplify the elements of the jacobian. In equation the off-diagonal elements of  $J_{11}$  and  $J_{22}$  are given by

$$\frac{\partial P_i}{\partial \delta_j} = |V_j| \frac{\partial Q_i}{\partial |V_j|} = -|V_i V_j Y_{ij}| \sin(\theta_{ij} + \delta_j - \delta_i)$$

NPTEL A.K. Sinha 20/42

Now, if we see this term for  $Q_i$  it will be  $V_i V_j$  into  $Y_{ij} \sin(\theta_{ij} + \delta_j - \delta_i)$ . Now, here what happens is this term will be a summation of all these terms. Whereas we know that the term for  $Y_{ij}$  is a negative term of  $Y_{ij}$  the actual admittance between the for the line connecting bus  $I$  and  $j$ . And  $B_{ii}$  is a term, which is sum of all the susceptances for connected to that line; that is connected to that bus.

So, susceptances for all the transmission lines connected to that bus, when we add them we get  $B_{ii}$ . And  $B_{ij}$  is negative of the susceptance which is connected to that between bus  $I$  and  $j$ . Therefore if we look at this the  $Q_i$  since it is summation of all those terms with summation  $B_{ij} V_i$  into  $V_j$ .

Therefore  $V_i$  and  $V_j$  magnitude values will be very nearly equal to 1. And therefore, what we find is the total summation is going to be much smaller, because there are all  $B_{ij}$  terms, which are negative terms will be subtracted from  $B_{ii}$ . And the total value of  $Q_i$  therefore, is going to be much smaller than this.

Now, these approximations can be used to simplify the elements of the Jacobian matrix. In equation the off diagonal elements  $J_{11}$  and  $J_{22}$  that is  $J_{11}$  and  $J_{22}$  are given by  $\frac{\partial P_i}{\partial \delta_j}$  is equal to  $V_j \frac{\partial Q_i}{\partial |V_j|}$ . This is equal to minus  $V_i V_j$  into  $Y_{ij} \sin(\theta_{ij} + \delta_j - \delta_i)$ .

Using the identity  $\sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$  in the equation gives us  $\frac{\partial P_i}{\partial \delta_j} = V_j \frac{\partial Q_i}{\partial |V_j|}$ . This is equal to minus  $V_i V_j B_{ij} \cos(\delta_j - \delta_i) + G_{ij} \sin(\delta_j - \delta_i)$ ,

where we have used this  $B_{ij}$  as  $Y_{ij} \sin \theta_{ij}$  this the susceptance part. And  $G_{ij}$  is equal to  $Y_{ij} \cos \theta_{ij}$ , which is the conductance part. The approximations listed above yields the off diagonal elements.

(Refer Slide Time: 33:00)

Indian Institute of Technology, Kharagpur

$$\frac{\partial P_i}{\partial \delta_j} = |V_j| \frac{\partial Q_i}{\partial |V_j|} \cong -|V_i V_j| B_{ij}$$

The diagonal elements of J1 and J4 are:

$$J_{1_{ii}} = -Q_i - |V_i|^2 B_{ii}; \quad J_{4_{ii}} = |V_i| \frac{\partial Q_i}{\partial |V_i|} = Q_i - |V_i|^2 B_{ii}$$

Applying the inequality  $Q_i \ll |V_i|^2 B_{ii}$  to those expressions yields

$$\frac{\partial P_i}{\partial \delta_i} \cong |V_i| \frac{\partial Q_i}{\partial |V_i|} \cong -|V_i|^2 B_{ii}$$

NPTEL
A.K. Sinha
22/42

As minus  $V_i V_j B_{ij}$ , the diagonal elements of J1 and J4 are  $J_{1_{ii}}$  is equal to minus  $Q_i$  into  $V_i$  square into  $B_{ii}$ . And  $J_{4_{ii}}$  is equal to  $V_i$  into  $\frac{\partial Q_i}{\partial |V_i|}$ , which is equal to  $Q_i$  minus  $V_i$  square  $B_{ii}$ . So, if we see these elements applying the  $Q_i$  is much smaller than  $V_i$  square  $B_{ii}$ ; that means, this term much smaller than this term. So, the expression for  $\frac{\partial P_i}{\partial \delta_i}$  will be approximately equal to  $V_i$  into  $\frac{\partial Q_i}{\partial |V_i|}$  by  $\frac{\partial Q_i}{\partial |V_i|}$ . And both will be approximately equal to  $V_i$  square into  $B_{ii}$ . So, this is what we see that the diagonal elements will be given by this; whereas, the off diagonal elements will be given by this.

(Refer Slide Time: 34:01)

Indian Institute of Technology, Kharagpur

For a 4-bus system with bus 1 as a slack bus:

$$\begin{bmatrix} -|V_2 V_2| B_{22} & -|V_2 V_3| B_{23} & -|V_2 V_4| B_{24} \\ -|V_2 V_3| B_{32} & -|V_3 V_3| B_{33} & -|V_3 V_4| B_{34} \\ -|V_2 V_4| B_{42} & -|V_3 V_4| B_{43} & -|V_4 V_4| B_{44} \end{bmatrix} \begin{bmatrix} \Delta \delta_2 \\ \Delta \delta_3 \\ \Delta \delta_4 \end{bmatrix} = \begin{bmatrix} \Delta P_2 \\ \Delta P_3 \\ \Delta P_4 \end{bmatrix}$$

NPTEL A.K. Sinha 23/42

Now, if we take a 4 bus system where bus 1 is a slack bus then we can write the expression for  $J_1$  into  $\Delta \delta$  is equal to  $\Delta P$  in this form as  $V_2$  into  $V_2 B_{22}$  minus  $V_2$  into  $V_3 B_{23}$  minus  $V_2$  into  $V_4 B_{24}$ . And similarly  $V_2 V_3$  into  $B_{32}$   $V_3 V_3$  into  $B_{33}$ , this that is what we have if got is  $V_2 V_2$  into  $B_{22}$  into  $\Delta \delta_2$ ,  $\Delta \delta_2$  minus  $V_2$  into  $V_3 B_{23}$  into  $\Delta \delta_3$  and so on. So, this is the expression that we have got these are the Jacobian element, Jacobian matrix elements.

(Refer Slide Time: 34:50)

Indian Institute of Technology, Kharagpur

$$\begin{bmatrix} -|V_2 V_2| B_{22} & -|V_2 V_3| B_{23} & -|V_2 V_4| B_{24} \\ -|V_2 V_3| B_{32} & -|V_3 V_3| B_{33} & -|V_3 V_4| B_{34} \\ -|V_2 V_4| B_{42} & -|V_3 V_4| B_{43} & -|V_4 V_4| B_{44} \end{bmatrix} \begin{bmatrix} \frac{\Delta |V_2|}{|V_2|} \\ \frac{\Delta |V_3|}{|V_3|} \\ \frac{\Delta |V_4|}{|V_4|} \end{bmatrix} = \begin{bmatrix} \Delta Q_2 \\ \Delta Q_3 \\ \Delta Q_4 \end{bmatrix}$$

NPTEL A.K. Sinha 24/42

Similarly, for the other expression that is for  $L$  into  $\Delta V$  by  $V$  is equal to  $\Delta Q$  expression we have got like this which is  $V_2$  into  $V_2 B_{22}$  in this form.

(Refer Slide Time: 35:10)

Indian Institute of Technology, Kharagpur

$$-B_{22}\Delta|V_2| - B_{23}\Delta|V_3| - B_{24}\Delta|V_4| = \frac{\Delta Q_2}{|V_2|}$$

$$-|V_2|B_{22}\Delta\delta_2 - |V_3|B_{23}\Delta\delta_3 - |V_4|B_{24}\Delta\delta_4 = \frac{\Delta P_2}{|V_2|}$$

NPTEL A.K. Sinha 25/42

So, now if we take up 1 equation then we have say this equation for the first row that is  $\Delta Q_2$  is equal to  $B_{22}\Delta|V_2| - B_{23}\Delta|V_3| - B_{24}\Delta|V_4|$  this is what we will get. Here we had this term  $|V_2|$ ,  $|V_2|$  into  $|V_2|$  into  $|V_3|$  into  $|V_4|$ . So, what we have done is we have taken out that  $|V_2|$  term and divided it here.

Similarly, for the expression from here again ((Refer Time: 35:56)) we will get  $|V_2|B_{22}\Delta\delta_2 - |V_3|B_{23}\Delta\delta_3 - |V_4|B_{24}\Delta\delta_4$  into this term into  $\Delta\delta_2$  this term into  $\Delta\delta_3$  this term into  $\Delta\delta_4$  is equal to  $\Delta P_2$ . Now, these  $|V_2|$  terms in this if we take out and divide on this side, this equation remains same. So, what, that is what is we have done. So, we have  $|V_2|B_{22}\Delta\delta_2 - |V_3|B_{23}\Delta\delta_3 - |V_4|B_{24}\Delta\delta_4$  is equal to  $\Delta P_2$  by  $|V_2|$ .

(Refer Slide Time: 36:50)

Indian Institute of Technology, Kharagpur

$$\begin{bmatrix} -B_{22} & -B_{23} & -B_{24} \\ -B_{32} & -B_{33} & -B_{34} \\ -B_{42} & -B_{43} & -B_{44} \end{bmatrix} \begin{bmatrix} \Delta\delta_2 \\ \Delta\delta_3 \\ \Delta\delta_4 \end{bmatrix} = \begin{bmatrix} \frac{\Delta P_2}{|V_2|} \\ \frac{\Delta P_3}{|V_3|} \\ \frac{\Delta P_4}{|V_4|} \end{bmatrix}$$

NPTEL A.K. Sinha 26/42

So, from here we can, now see we can write this expression here like this, minus B<sub>22</sub> minus B<sub>23</sub> minus B<sub>24</sub> and so on; into delta delta 2 delta delta 3 delta delta 4 is equal to delta P<sub>2</sub> by V<sub>2</sub> delta P<sub>3</sub> by V<sub>3</sub> delta P<sub>4</sub> by V<sub>4</sub> in this way.

(Refer Slide Time: 37:31)

Indian Institute of Technology, Kharagpur

$$\begin{bmatrix} -B_{22} & -B_{23} & -B_{24} \\ -B_{32} & -B_{33} & -B_{34} \\ -B_{42} & -B_{43} & -B_{44} \end{bmatrix} \begin{bmatrix} \Delta|V_2| \\ \Delta|V_3| \\ \Delta|V_4| \end{bmatrix} = \begin{bmatrix} \frac{\Delta Q_2}{|V_2|} \\ \frac{\Delta Q_3}{|V_3|} \\ \frac{\Delta Q_4}{|V_4|} \end{bmatrix}$$

NPTEL A.K. Sinha 27/42

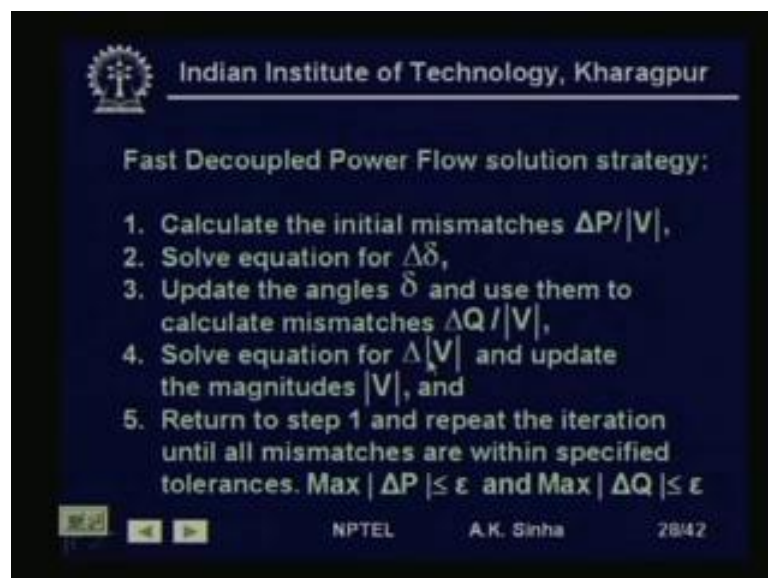

And similarly for the other expression we have again minus B<sub>22</sub> minus B<sub>23</sub> minus B<sub>24</sub>. So, this matrix we have this matrix which is containing terms of susceptance only this is delta V<sub>2</sub>. Now, this term that we had multiplied V<sub>2</sub> here and we have divided V<sub>2</sub> V<sub>3</sub> here. So, this we have taken out. So, this again now a constant term this is delta V<sub>2</sub> delta V<sub>3</sub> and delta V<sub>4</sub>.

And this  $V^2$  we had divided, so we are getting  $\Delta Q^2$  by  $V^2$ ,  $\Delta Q^3$  by  $V^3$  and  $\Delta Q^4$  by  $V^4$ .

Now, what we have seen from these two sets of equation that the matrix Jacobian matrix here is only the susceptance elements. And therefore, these are constants, they are not depend on the state variables. And therefore, these remain constant throughout the different iterations. So, they do not vary with the iterations.

Now, if they do not change with the iterations means we do not need to compute these elements each time. that is one advantage. The other advantage is once we have triangularized these matrices, we can keep the matrix elements stored. Because they are not going to change and what we need to change is only do a forward operation on this vector. And then using a back substitution we can calculate the value of the unknown's  $\Delta V$  and  $\Delta \delta$ . So, this is a great advantage that we get because the matrix is now a constant matrix, we can store the factors of this matrix or triangularized matrix. And we can use them in each iteration.

(Refer Slide Time: 39:39)

Indian Institute of Technology, Kharagpur

Fast Decoupled Power Flow solution strategy:

1. Calculate the initial mismatches  $\Delta P/|V|$ ,
2. Solve equation for  $\Delta \delta$ ,
3. Update the angles  $\delta$  and use them to calculate mismatches  $\Delta Q/|V|$ ,
4. Solve equation for  $\Delta |V|$  and update the magnitudes  $|V|$ , and
5. Return to step 1 and repeat the iteration until all mismatches are within specified tolerances.  $\text{Max } |\Delta P| \leq \epsilon$  and  $\text{Max } |\Delta Q| \leq \epsilon$

NPTEL A.K. Sinha 2842

This considerably reduces the computational requirement for this method and this is why this method is called a fast decoupled power flow method, because this is much faster and it uses a decoupled relationship. That is P delta and Q V relations are decoupled, that is P is decoupled from V and Q is decoupled from delta.

Now, the algorithm for fast decoupled power flow is as such, calculate the initial mismatches  $\Delta P$  by  $V$ . Solve for  $\Delta \delta$ . Update the angles  $\delta$  and use them to

calculate mismatches  $\Delta Q$  by  $V$ . Solve the equation for  $\Delta V$  and update the magnitudes of  $V$ . And return to step one and repeat the iteration until all mismatches are within specified tolerances.

That is maximum  $\Delta P$  is less than some tolerance value that we have and maximum  $\Delta Q$  is less than some tolerance value. So, what we need to do is, if we see here ((Refer Time: 41:02)) what we do is this matrix is already available, because we know the susceptances for the system.

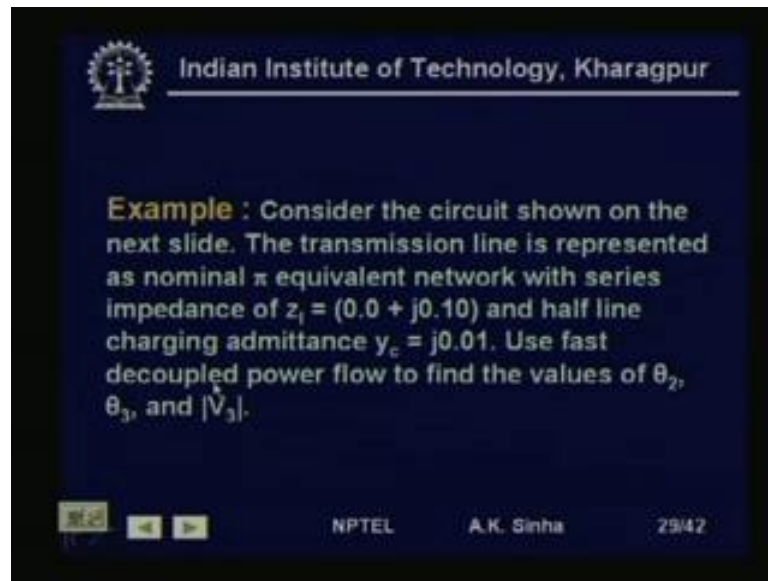

We compute these elements and solve for this. Once we get these values, we add it to the previous values of  $\Delta$ , and so we get the new values of  $\Delta$ . Once we have got these values of  $\Delta$ , using this we will compute the elements of this vector that is  $\Delta Q$  by  $V$  vector right, and since this matrix is already known. So, we will compute this by solving this equation. So, once we get this  $\Delta V$ 's, we add it to the previous value previous iteration values of  $V$  and we get the new values of  $V$ . And then we go back and again compute these values with the new values of  $V$  obtained and solve for  $\Delta$ .

And this way we keep on repeating the iteration till we find that, the value of  $\Delta P$  for all the elements or all the buses and  $\Delta Q$  for all the buses or with the limits. So, if well that happens, then we have got the values of  $B$  and  $\Delta$  and using this we can calculate all the power flows in the transmission lines slack bus powers and  $P V$  bus  $Q$  values.

Now, if we have any  $P V$  bus in the system, then the row and column for that bus will not be there in the matrix for this expression. So, the two matrices this matrix is generally termed as a  $B$  dash matrix that is  $B$  dash into  $\Delta$  is equal to  $\Delta P$  by  $V$ . And this matrix is called  $B$  double dash matrix. So,  $B$  double dash into  $\Delta V$  is equal to  $\Delta Q$  by  $V$ . So, this is the expression that we have and this is the algorithm that we use for solving the power flow using fast decoupled power flow method.

(Refer Slide Time: 43:33)

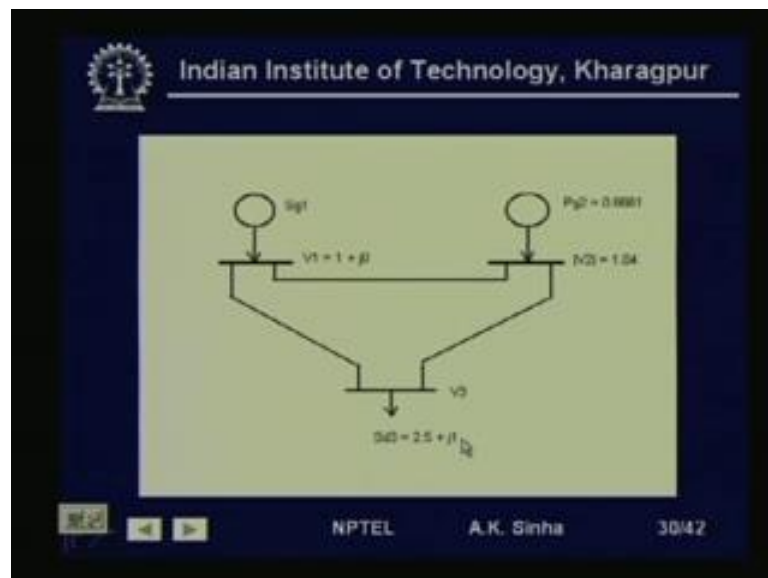

Indian Institute of Technology, Kharagpur

**Example :** Consider the circuit shown on the next slide. The transmission line is represented as nominal  $\pi$  equivalent network with series impedance of  $z_l = (0.0 + j0.10)$  and half line charging admittance  $y_c = j0.01$ . Use fast decoupled power flow to find the values of  $\theta_2$ ,  $\theta_3$ , and  $|V_3|$ .

NPTEL A.K. Sinha 29/42

Now, we will take one example for solving a power flow using fast decoupled method. So, consider the circuit shown on the next slide the transmission line is represented as nominal pi equivalent network with series impedance  $Z_1$  is equal to  $0.0 + j 0.1$  and half line charging admittance  $Y_c$  is equal to  $j 0.01$ . Using fast decoupled power flow find the values of  $\theta_2$ ,  $\theta_3$  and  $V_3$ .

(Refer Slide Time: 44:09)

Now, if you see this system this is a 3 bus system. This bus 1 is a slack bus, where the voltage is specified as  $1 \angle 0$  that is  $1 + j 0$ . Bus 2 is a PV bus where we have the

real power injection given as 0.6661 per unit. And the voltage magnitude at this bus is given as 1.04 per unit. Bus 3 is a PQ bus, where the load value is given as 2.5 plus j 1.

(Refer Slide Time: 44:48)

Indian Institute of Technology, Kharagpur

**Solution: We have**

$$P_{G2} = 0.6661$$

$$|V_2| = 1.04$$

$$B_{ij} = 10, i \neq j$$

$$B_{ii} = -19.98$$

$$P_2 = 0.6661$$

$$P_3 = -2.5$$

$$Q_3 = -1.0$$

NPTEL A.K. Sinha 31/42

Now, using the transmission line impedance values, we have got  $B_{ij}$  is equal to 10 for  $i$  not equal to  $j$  that is  $B_{12}$ ,  $B_{13}$ ,  $B_{23}$ ,  $B_{32}$  all these terms will be equal to 10, because it is equal to  $1$  by  $0.1 \times 0.1$ . So, that becomes minus  $j$  10. And  $B_{ii}$  is equal to minus 19.98, because we add all the susceptances connected to the bus plus the half line charging of the 2 lines at that bus.

This we had already calculated in the previous lesson. So, I am just substituting those values. We have been given  $P_{G2}$  is equal to 0.6661 and  $V_2$  as 1.04. We have, therefore  $P_2$  the real power injection at bus 2 is equal to  $P_{G2}$  minus  $P_{D2}$ , the demand at that bus. Since the demand at that bus is 0 or the load at bus is 0.

So,  $P_2$  is equal to 0.6661.  $P_3$  is  $P_{G3}$  minus  $P_{D3}$ . So,  $P_{G3}$  is 0. So,  $P_{D3}$  is 2.5. So,  $P_{G3}$  minus  $P_{D3}$ . So,  $P_3$  is equal to minus 2.5. Similarly,  $Q_3$  is equal to  $Q_{G3}$  minus  $Q_{D3}$ . So,  $Q_{G3}$  is zero and  $Q_{D3}$  is 1.0. So,  $Q_3$  is equal to 0 minus 1.0 which is minus 1.0.

(Refer Slide Time: 46:44)

Indian Institute of Technology, Kharagpur

We first find B.

$$B = \begin{bmatrix} B_{22} & B_{23} \\ B_{32} & B_{33} \end{bmatrix} = \begin{bmatrix} -19.98 & 10 \\ 10 & -19.98 \end{bmatrix}$$

For the fast decoupled power flow, we have

$$-B \cdot \begin{bmatrix} \Delta\theta_2 \\ \Delta\theta_3 \end{bmatrix}^n = \begin{bmatrix} \Delta P_2 / |V_2| \\ \Delta P_3 / |V_3| \end{bmatrix}^n$$

NPTEL A.K. Sinha 32/42

Now, we have to find B matrix. So, B matrix is  $B_{22} B_{23} B_{32} B_{33}$ , because bus 1 this is slack bus. So, here we have the values substituted. Now, for fast decoupled power flow we have minus B into delta theta or delta delta is equal to del P by del V.

(Refer Slide Time: 47:22)

Indian Institute of Technology, Kharagpur

And,

$$-B \cdot \begin{bmatrix} \Delta |V_3| \end{bmatrix}^n = \begin{bmatrix} \Delta Q_3 / |V_3| \end{bmatrix}^n$$

We can take the inverse of the above equations to get the explicit iteration formulas

$$\begin{bmatrix} \Delta\theta_2 \\ \Delta\theta_3 \end{bmatrix}^n = -B^{-1} \cdot \begin{bmatrix} \Delta P_2 / |V_2| \\ \Delta P_3 / |V_3| \end{bmatrix}^n$$

NPTEL A.K. Sinha 33/42

So, and we have minus B into del V is equal to del Q by V. Now, we can take the inverse of above equations to get, that is we can solve this by using minus B inverse into this will give me this. And similarly minus B inverse into this will give me this that is delta theta or delta delta. Whatever you write at nth iteration is equal to minus B inverse into delta P

by V at nth iteration or we can write delta theta 2 delta theta 3 at nth iteration, this is the value of B inverse.

(Refer Slide Time: 48:05)

Indian Institute of Technology, Kharagpur

Or

$$\begin{bmatrix} \Delta\theta_2 \\ \Delta\theta_3 \end{bmatrix}^n = \begin{bmatrix} 0.0668 & 0.0334 \\ 0.0334 & 0.0668 \end{bmatrix}^n \begin{bmatrix} \Delta P_2 / 1.04 \\ \Delta P_3 / |V_3| \end{bmatrix}^n \dots(1)$$

Similarly

$$\begin{bmatrix} \Delta |V_3| \end{bmatrix}^n = -B^{-1} \cdot \begin{bmatrix} \Delta Q_3 / |V_3| \end{bmatrix}^n$$

$$= 0.0501 \begin{bmatrix} \Delta Q_3 / |V_3| \end{bmatrix}^n \dots(2)$$

NPTEL A.K. Sinha 34/42

So, this into this will give me the value of this. Similarly, del V 3 at n is minus B inverse into del Q 3 by del V 3. Now, here this, since we have only V 3 that is bus 3 terms available. So, the in this case minus B inverse will be only the inverse of this term. So, B is given like this and for the Q equation, we have only for bus 3. So, bus 2 row and column is eliminated and we have only B 3 available. So, we using this we get del V 3 as this much.

(Refer Slide Time: 49:22)

Indian Institute of Technology, Kharagpur

We write the equations for the given system.

$$P_2(x) = |V_2| \cdot |V_1| \cdot B_{21} \cdot \sin(\theta_2 - \theta_1) + |V_2| \cdot |V_3| \cdot B_{23} \cdot \sin(\theta_2 - \theta_3)$$

$$= 10.4 \sin\theta_2 + 10.4 |V_3| \sin(\theta_2 - \theta_3) \quad (3)$$

$$P_3(x) = |V_3| \cdot |V_1| \cdot B_{31} \cdot \sin(\theta_3 - \theta_1) + |V_3| \cdot |V_2| \cdot B_{32} \cdot \sin(\theta_3 - \theta_2)$$

$$= 10 |V_3| \sin\theta_3 + 10.4 |V_3| \sin(\theta_3 - \theta_2) \quad (4)$$

NPTEL A.K. Sinha 35/42

Now, we can calculate the value of injection at bus 2 and bus 3 using the value of V and theta or delta, that is the phase angle using the expression for real power injection at bus 2 and 3.

(Refer Slide Time: 49:46)

Indian Institute of Technology, Kharagpur

$$Q_3(x) = - [ |V_3| \cdot |V_1| \cdot B_{31} \cdot \cos(\theta_3 - \theta_1) + |V_3| \cdot |V_2| \cdot B_{32} \cdot \cos(\theta_3 - \theta_2) + |V_3|^2 B_{33} ]$$

$$= - [ 10 |V_3| \cdot \cos\theta_3 + 10.4 |V_3| \cdot \cos(\theta_3 - \theta_2) - 19.98 |V_3|^2 ] \quad (5)$$

NPTEL A.K. Sinha 36/42

And similarly the reactive power injection at bus 3.

(Refer Slide Time: 49:52)

Indian Institute of Technology, Kharagpur

Assuming a flat start, we have

$$\theta_2^0 = \theta_3^0 = 0^\circ$$

$$|V_3^0| = 1.0$$

The values of the  $P_2(x^0)$ ,  $P_3(x^0)$  and  $Q_2(x^0)$  can be calculated from equations (3), (4) & (5). Substituting values we get

$$P_2^0 = P_3^0 = 0$$

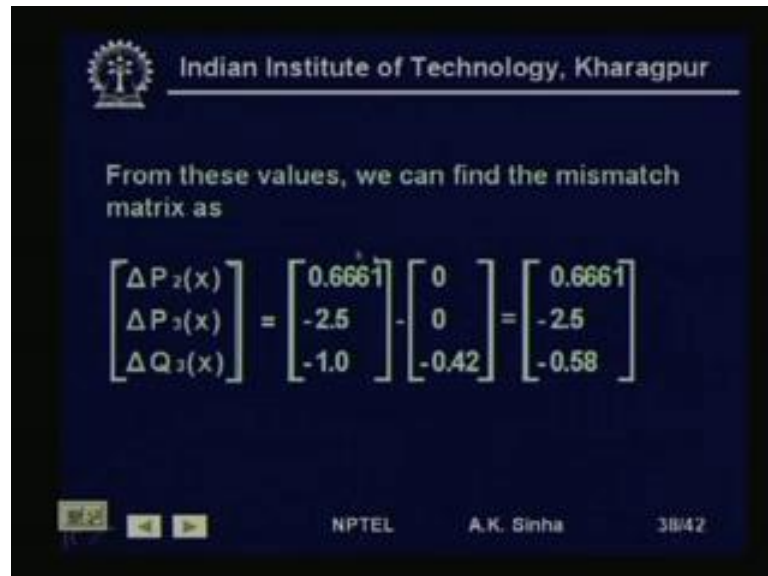

$$Q_3^0 = -0.42$$

NPTEL A.K. Sinha 37/42

So, once we take or assume a starting value the starting value normally as we said earlier we assume as a flat start. So, theta 2 and theta 3 at the starting point is 0 degrees and V 3 at starting point is 1 per unit. The values of P 2 at the starting point P 3 at the starting point and Q 2 oh Q 3 at the starting point can be calculated this should be Q 3 at the

starting point can be calculated from these equations. Substituting the values we get P 2 is equal to P 3 is equal to 0 and Q 3 is equal to minus 0.42.

(Refer Slide Time: 50:39)

Indian Institute of Technology, Kharagpur

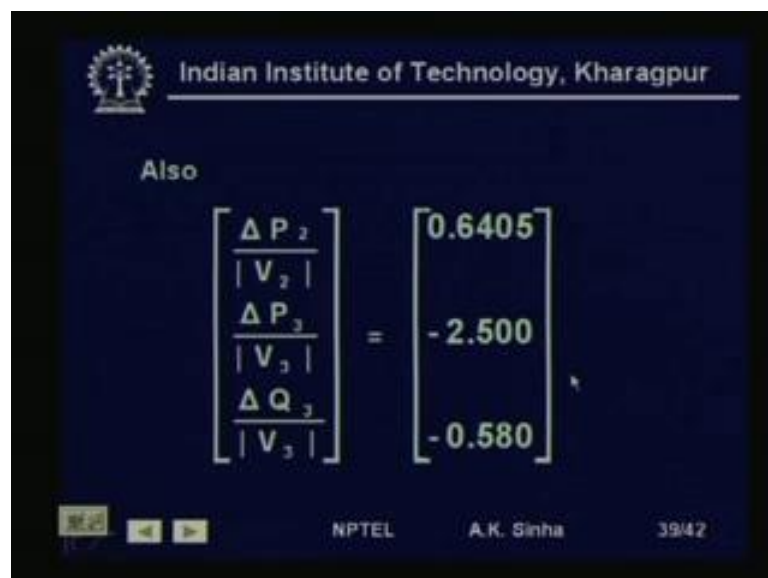

From these values, we can find the mismatch matrix as

$$\begin{bmatrix} \Delta P_2(x) \\ \Delta P_3(x) \\ \Delta Q_3(x) \end{bmatrix} = \begin{bmatrix} 0.6661 \\ -2.5 \\ -1.0 \end{bmatrix} - \begin{bmatrix} 0 \\ 0 \\ -0.42 \end{bmatrix} = \begin{bmatrix} 0.6661 \\ -2.5 \\ -0.58 \end{bmatrix}$$

NPTEL A.K. Sinha 38/42

Now, now substituting these we can find the mismatches like this. So, we will have the mismatch values as 0.6661 minus 2.5 and 0.58. That is delta P 2 is 0.6661 minus 0, delta P 3 is minus 2.5 minus 0, delta Q 3 is minus 1 minus 0.42. So, this will give you delta P 2 is equal to 0.6661, delta P 3 is minus 2.5. Delta Q 3 is minus 0.58.

(Refer Slide Time: 51:23)

Indian Institute of Technology, Kharagpur

Also

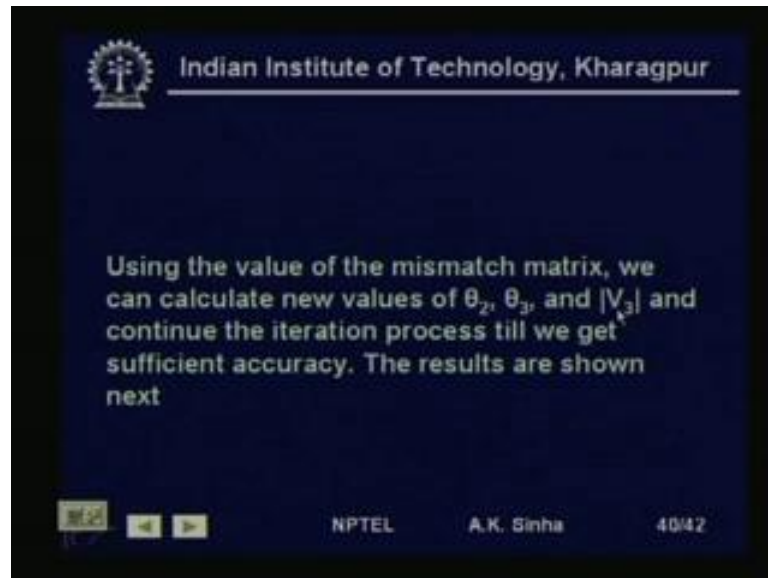

$$\begin{bmatrix} \frac{\Delta P_2}{|V_2|} \\ \frac{\Delta P_3}{|V_3|} \\ \frac{\Delta Q_3}{|V_3|} \end{bmatrix} = \begin{bmatrix} 0.6405 \\ -2.500 \\ -0.580 \end{bmatrix}$$

NPTEL A.K. Sinha 39/42

So, once we have that then we have this del P 2 by del V 2. So, V 2 is given as 1.04. So, 0.6661 divided by 1.04 gives me this. Del P 3 by del by V 3, now V 3 is 1.0. So, we get

this same as 2.5 minus 2.5 by 1, which is same as minus 2.5.  $\Delta Q_3$  by  $V_3$  as minus 0.580 by 1, which is same as 0.5 is a minus 0.580.

(Refer Slide Time: 52:01)

Using the value of mismatch matrix, we can calculate the value of theta 2 theta 3 and  $V_3$  and continue the iteration process till we get sufficient accuracy.

(Refer Slide Time: 52:13)

Indian Institute of Technology, Kharagpur

Itn. No.	$\theta_2$	$\theta_3$	$ V_3 $	$\Delta P_2/ V_3 $	$\Delta P_3/ V_3 $	$\Delta Q_3/ V_3 $
0	0	0	1	0.6405	-2.5	-0.58
1	-2.3319	8.3423	0.9709	0.0308	-0.0351	-0.1857
2	-2.2815	-8.4179	0.9616	0.0107	-0.0242	-0.0201
3	-2.2869	-8.4900	0.9606	0.0015	-0.0024	-0.0043

NPTEL A.K. Sinha 41/42

The results are shown here. That is the initial values we have theta 2 theta 3 as 0 and  $V_3$  as 1 and these are the value of  $P_2$  by  $V_2$   $P_3$  delta  $P_2$  by delta  $P_3$  by  $V_3$  and delta  $Q_3$  by  $V_3$ . After first iteration the values of theta 2 theta 3 and  $V_3$  come out like this.

And then when we calculate the new values we get the new values like this. Again using these values when these compute we get  $\theta_2$   $\theta_3$  and  $V_3$  like this. And when we again we find mismatches we are getting like this. Again substituting those values we will get these values of as the angles and the voltage magnitude. And here we find that the mismatches have reduced considerably and since we have used our tolerance value to be of the order of 0.005. So, these have converged. So, these are the final value of  $\theta_2$   $\theta_3$  and  $P_3$ .

Thank you very much.

Welcome to lesson 21. In this session we will continue with the Power Flow problem.

(Refer Slide Time: 53:53)

Indian Institute of Technology, Kharagpur

## Power Flow

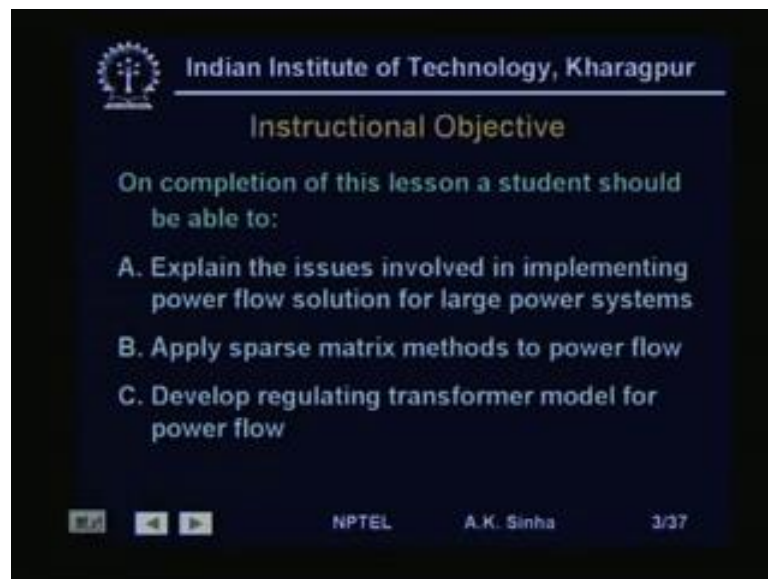

Lesson Summary

1. Power Flow for Large Power Systems
2. Sparse Matrix methods
3. Regulating Transformers in Power Flow

NPTEL A.K. Sinha 2/37

In this lesson we will first take up a power flow problem for large power systems how you implement it what are the implementation aspects. One of the aspects which we will look at will be sparse matrix methods and its application to power flow problem. And then we will also look into the modeling of regulating transformers in power flow problem.

(Refer Slide Time: 54:30)

Indian Institute of Technology, Kharagpur

## Instructional Objective

On completion of this lesson a student should be able to:

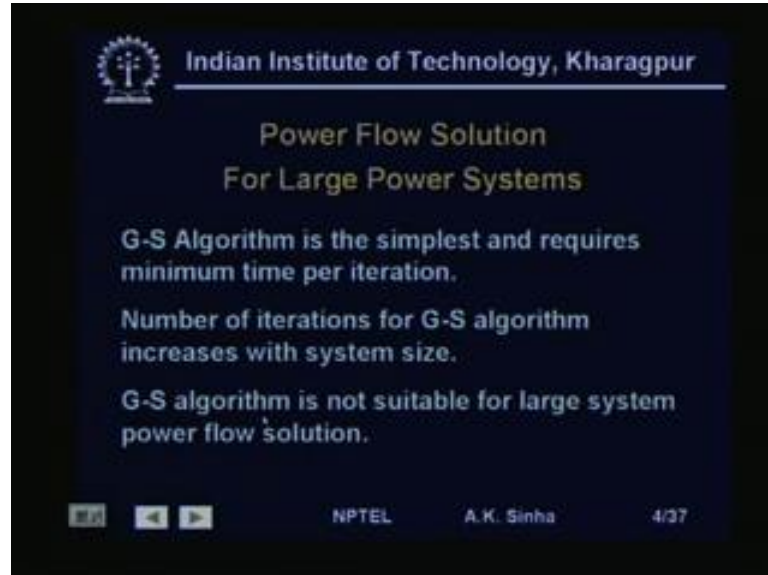

- A. Explain the issues involved in implementing power flow solution for large power systems
- B. Apply sparse matrix methods to power flow
- C. Develop regulating transformer model for power flow

NPTEL A.K. Sinha 3/37

On the completion of this lesson you should be able to explain the issues involved in implementing power flow solution for large power systems. Apply sparse matrix

methods to power flow and develop regulating transformer model for power flow solution.

(Refer Slide Time: 54:54)

Indian Institute of Technology, Kharagpur

### Power Flow Solution For Large Power Systems

G-S Algorithm is the simplest and requires minimum time per iteration.

Number of iterations for G-S algorithm increases with system size.

G-S algorithm is not suitable for large system power flow solution.

NPTEL A.K. Sinha 4/37

Now, what are the types of power flow methods that we have learnt earlier. We have discussed about the Gauss Seidel method for solution of power flow problem, then we looked into the Newton Raphson method. Then we tried to take advantage of the physical property of the power system; where the real power and voltage phase angle close association. And reactive power and the voltage magnitude closer association was taken into a account. And the power flow equations were decoupled into P delta and Q V chooses a problems. And then we saw that by taking certain physical characteristics of the power system.

(Refer Slide Time: 56:01)

Indian Institute of Technology, Kharagpur

### Ordering Schemes

Let us take the same matrix A

$$A = \begin{bmatrix} 1.0 & 5.0 & 6.0 & 7.0 \\ 8.0 & 2.0 & 0 & 9.0 \\ 10.0 & 0 & 3.0 & 0 \\ 11.0 & 0 & 0 & 4.0 \end{bmatrix}$$

NPTEL A.K. Sinha 13/37

Now, let us see if we the factorization for this kind of a matrix what happens. Now, if we take a matrix like this, that we have used earlier the same matrix, and if you try to use the gauss elimination method for factorizing this matrix then.

(Refer Slide Time: 56:29)

Indian Institute of Technology, Kharagpur

After 1<sup>st</sup> step of Gauss elimination matrix becomes:

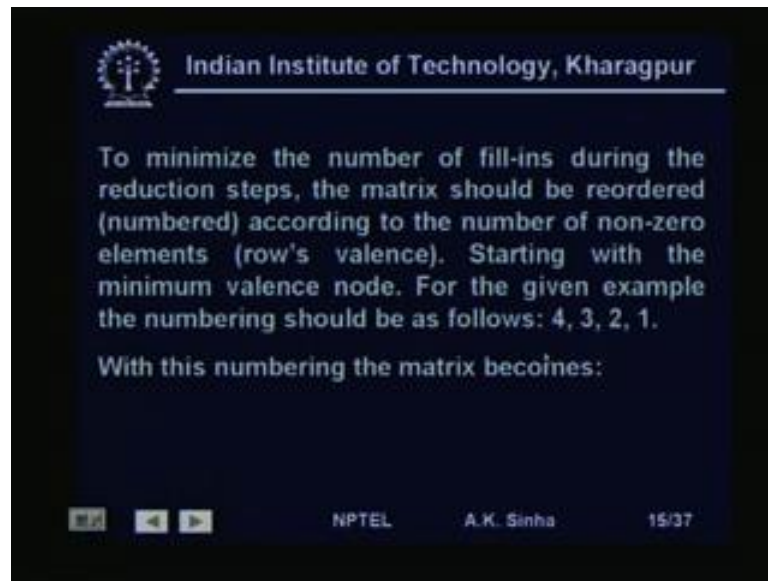

$$A = \begin{bmatrix} 1 & 5 & 6 & 7 \\ 0 & -38 & -48 & -47 \\ 0 & -50 & -57 & -70 \\ 0 & -55 & -66 & -73 \end{bmatrix}$$

Sparsity of A is lost completely in this case

NPTEL A.K. Sinha 14/37

After the first step of Gauss elimination that is reducing all the elements in the first column as 0's what we will have is all these elements which were zero or now getting filled in. That is instead of a Gauss matrix now we have a completely full matrix. That means sparsity is lost, because we get large number of fill in's in this case.

(Refer Slide Time: 57:05)

Now, let us see what we can do about it. So, if we are trying to advantage of sparse matrix and we want to use this sparse matrix method. If we go through the factorization just like that for the given matrix, then we find that this sparsity is no longer maintained because large number of fill in's will come. So, what we do to minimize these fill in's.

So, to minimize these fill in's during the reduction step the matrix needs to be re ordered or re numbered according to the number of non zero elements, which in each row, which we call the rows valance. So, if we take any row and see how many non zero elements are there in that row and we call that as the rows valance.

So, if we pick up the rows, which have minimum number of non zero elements or the rows with minimum valance or ordered as row number 1 and so on. We go tell we reached the last row which will have the largest number of non zero elements. Then we will talk about the regulating transformers and how we can model them in a power flow solution.

And then we will see some comparison of the Newton Raphson load flow and fast decoupled load flow algorithms. So, with this we will stop today. And we will take up in the next lesson, the other things as I discussed just now.

Thank you very much.
