**Analytical Solution of Matrix Differential Riccati Equation**  
**(Similarity Transformation Approach) (Continued)**

Welcome class. Today's lecture we are continuing from our previous lecture discussion which was on the Analytical Solution of Matrix Differential Riccati Equation. So, we are utilizing the eigenvector and the eigenvalue concept to determine the solution of the matrix differential Riccati equation.

(Refer Slide Time: 00:54)

**Analytical Solution of Matrix DRE**

- Determines the transient and steady state solution of the *Matrix Differential Riccati Equation*.
- The method involves the calculation of *eigenvalues and eigenvectors* of the Hamiltonian Matrix of the system.

IIT ROORKEE | NPTEL ONLINE CERTIFICATION COURSE

So, this method as we have discussed determine the transient and the study state solution of the matrix differential Riccati equation and this method involves eigenvalue and the eigenvectors of the Hamiltonian Matrix of the system.

(Refer Slide Time: 01:03)

### Analytical Solution of Matrix DRE

The Hamiltonian System with the state & co-state equation is given by,

$$\begin{bmatrix} \dot{X}(t) \\ \dot{\lambda}(t) \end{bmatrix} = \begin{bmatrix} A & -E \\ -Q & -A' \end{bmatrix} \begin{bmatrix} X(t) \\ \lambda(t) \end{bmatrix} \quad (1)$$

where,

$$E = BR^{-1}B'$$

As we know we can define the Hamiltonian Matrix for a system which is time varying and linear. So, for a linear time varying system we are defining the Hamiltonian System which is nothing but this  $X$  dot  $t$  is my state equation and  $\lambda$  dot  $t$  is my costate equation. So, if I am clubbing this state and the costate equation I am getting the Hamiltonian Matrix in which  $E$  is nothing but my  $BR$  inverse  $B$  prime.

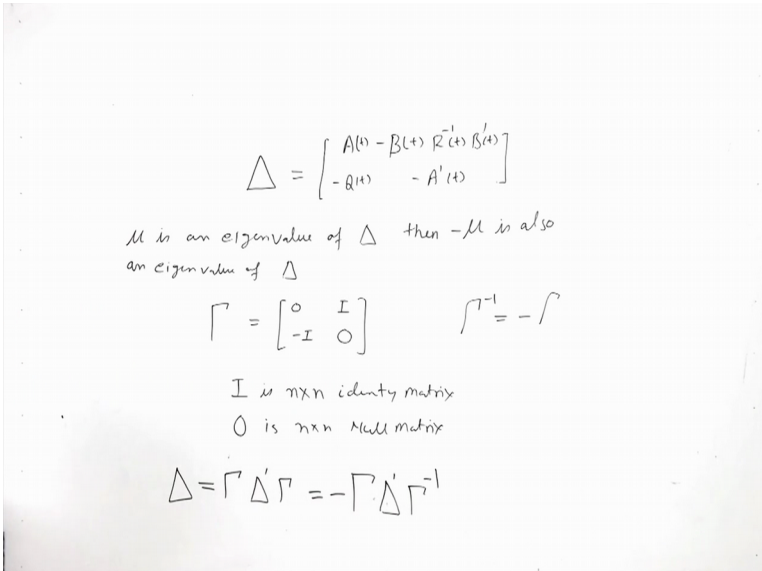

(Refer Slide Time: 01:38)

$$\Delta = \begin{bmatrix} A(t) - B(t)R^{-1}(t)B'(t) & \\ & -A'(t) \end{bmatrix}$$

$\mu$  is an eigenvalue of  $\Delta$  then  $-\mu$  is also an eigenvalue of  $\Delta$

$$\Gamma = \begin{bmatrix} 0 & I \\ -I & 0 \end{bmatrix} \quad \Gamma^{-1} = -\Gamma$$

$I$  is  $n \times n$  identity matrix  
 $O$  is  $n \times n$  Null matrix

$$\Delta = \Gamma \Delta' \Gamma = -\Gamma \Delta' \Gamma^{-1}$$

So, if we will see my Hamiltonian Matrix is  $A$  minus (Refer Time: 01:54)  $A^t B R$  inverse  $B$  transpose minus  $A^t$  minus  $A$  transpose. This is my Hamiltonian Matrix. For this matrix if you will say  $\mu$  is an eigenvalue of  $\Delta$  then  $-\mu$  is also an eigenvalue of  $\Delta$ .

This statement is true for  $\Delta$  that we will prove just now, and to prove this we consider a transformation  $\tau$  which is  $I$  minus  $I$  0. And this  $\tau$  will have the property, the  $\tau$  inverse is nothing but  $-\tau$  which we can easily prove if  $\tau$  is have they structure like  $\begin{bmatrix} 0 & I \\ I & 0 \end{bmatrix}$  then  $\tau$  inverse is nothing but  $-\tau$ . In this case my  $I$  is  $n$  cross  $n$  identity matrix and  $0$  is nothing but  $n$  cross  $n$  null matrix. So we are considering the  $\tau$ ,  $\tau$  inverse is  $-\tau$ . If we will use the transformation  $\tau \Delta \tau^{-1}$  is nothing but giving me the  $\Delta$ .

(Refer Slide Time: 04:16)

### Analytical Solution of Matrix DRE

The Hamiltonian System Matrix is defined as,

$$\Delta = \begin{bmatrix} A & -E \\ -Q & -A^t \end{bmatrix} \quad (5)$$

Consider a matrix of the form,

$$\Gamma = \begin{bmatrix} 0 & I \\ -I & 0 \end{bmatrix} \quad (6)$$

Such that,

$$\Gamma^{-1} = -\Gamma$$

(Refer Slide Time: 04:20)

## Analytical Solution of Matrix DRE

Pre and post multiplying the System Matrix results in,

$$\Delta = \Gamma \Delta' \Gamma = -\Gamma \Delta' \Gamma^{-1} \quad (8)$$

Proof:

$$\Gamma \Delta' \Gamma = \begin{bmatrix} 0 & I \\ -I & 0 \end{bmatrix} \begin{bmatrix} A' & -Q \\ -E & -A \end{bmatrix} \begin{bmatrix} 0 & I \\ -I & 0 \end{bmatrix} = \begin{bmatrix} -E & -A \\ -A' & Q \end{bmatrix} \begin{bmatrix} 0 & I \\ -I & 0 \end{bmatrix} = \begin{bmatrix} A & -E \\ -Q & -A' \end{bmatrix} = \Delta$$

My Hamiltonian Matrix is  $\tau \lambda' \tau^{-1}$ ;  $\tau^{-1}$  we know the  $\tau$  so simply I can also write this as  $-\tau \Delta' \tau$ . And this you can see as we have proved this my  $\tau$  is  $\begin{bmatrix} 0 & I \\ -I & 0 \end{bmatrix}$ , this is representing my  $\Delta$  I did a mistake, if pre and post multiply with this then I get  $-\tau^{-1}$ . So, in this case  $\Delta$  is  $\tau$ ;  $\Delta' \tau$  and  $\tau$  I can write as the  $\tau^{-1}$  minus of  $\tau^{-1}$ . So, I can represent this when this following manner.

So, if I will multiply this we can see that  $\tau \Delta' \tau$  is nothing but  $\Delta$ . So, with this transformation our objective is to prove that if  $\mu$  is the eigenvalue of  $\Delta$  then  $-\mu$  is also an eigenvalue of  $\Delta$ .

(Refer Slide Time: 05:56)

### Analytical Solution of Matrix DRE

Let ' $v$ ' be the eigenvector corresponding to the eigenvalue ' $\mu$ ' of the Hamiltonian Matrix  $\Delta$ ,

$$\Delta v = \mu v \quad (9)$$

Applying eqn. (8) in the above equation,

$$\begin{aligned} \Gamma \Delta' \Gamma v &= \mu v \\ \Delta' \Gamma v &= \mu \Gamma^{-1} v \\ \Delta' \Gamma v &= -\mu \Gamma v \\ (\Gamma v)' \Delta &= -\mu (\Gamma v)' \end{aligned} \quad (10)$$

IIT ROORKEE    NPTEL ONLINE CERTIFICATION COURSE

So, what we are considering? We are considering  $v$  to be an eigenvector corresponding to  $\mu$  of Hamiltonian Matrix  $\Delta$ . So, if  $v$  is the eigenvector and  $\mu$  is the eigenvalue of matrix  $\Delta$  then by definition of eigenvector.

(Refer Slide Time: 06:18)

$$\Delta = \begin{bmatrix} A(t) - B(t)R^{-1}(t)B'(t) & \\ -B(t) & -A'(t) \end{bmatrix}$$

$\mu$  is an eigenvalue of  $\Delta$  then  $-\mu$  is also an eigenvalue of  $\Delta$

$\Delta v = \mu v$  (where  $v$  is the eigenvector of  $\Delta$ )

$\Gamma^{-1}(\Gamma' \Delta' \Gamma v) = \Gamma^{-1}(\mu v)$

$\Delta'(\Gamma v) = \mu \Gamma^{-1} v = -\mu(\Gamma v)$

Taking transpose:  $(\Gamma v)' \Delta = -\mu(\Gamma v)'$

We will have  $\Delta v = \mu v$ , where  $v$  is the eigenvector of  $\Delta$  and  $\mu$  is the eigenvalue of  $\Delta$ . So, this is by the definition of the eigenvector we can write  $\Delta v = \mu v$ .

Now, this delta we are replacing by tau delta prime tau. So, this is this delta I am replacing by tau delta prime tau v and this as such mu v. This I will pre multiply with the delta inverse this whole equation are multiplying with delta inverse here; this sorry tau inverse on both the side. So, my this side will give me lambda prime tau v equal to so mu is the scalar, so I can write it outside tau inverse v. And this whole I can write, so what I am doing just club these two. And tau inverse I can write as minus mu tau v. So, the tau inverse is minus of tau. And I will also club and consider this.

I will take the transpose of this equation. Now, taking transpose what we get? Del v prime, sorry tau v prime delta equal to minus mu because it is a scalar and tau v prime. So, we can treat this tau v as my another eigenvector of delta. So, by the definition now minus mu is nothing but an eigenvalue of y delta.

(Refer Slide Time: 09:11)

$$\Delta = \begin{bmatrix} A(t) - B(t)R^{-1}(t)B'(t) & \\ & -B'(t)A'(t) \end{bmatrix}$$

$\mu$  is an eigenvalue of  $\Delta$  then  $-\mu$  is also an eigenvalue of  $\Delta$

$(\Gamma v)'$  is an eigenvector of  $\Delta$  then  $-\mu$  is an eigenvalue of  $\Delta$

Taking transpose  $(\Gamma v)' \Delta = -\mu (\Gamma v)'$

So, in this equation if we say tau v prime is an eigenvector of delta then minus mu is an eigenvalue of delta. So, we can say if mu is an eigenvalue of delta then minus mu is also an eigenvalue of delta. So, this is proved here.

(Refer Slide Time: 10:16)

**Analytical Solution of Matrix DRE**

From eqns. (9) and (10), it is clear that, If ' $\mu$ ' is an eigen value of the Hamiltonian Matrix  $\Delta$ , ' $-\mu$ ' is also an eigen value of the Hamiltonian Matrix.

IIT ROORKEE | NPTEL ONLINE CERTIFICATION COURSE

So, pre multiplying by tau inverse I get delta prime tau v as mu tau inverse v; tau inverse we are replacing by the minus tau. So, we are treating this as my eigenvector. And can state from 9 and 10; if mu is an eigenvalue of Hamiltonian Matrix delta then minus mu is also an eigenvalue of the Hamiltonian Matrix delta. Meaning here is: the Hamiltonian Matrix will have one set of the eigenvalues and another set of the eigenvalue is just opposite sign of the first set.

(Refer Slide Time: 10:53)

$$\Delta = \begin{bmatrix} A(t) - B(t)R^{-1}(t)B'(t) & \\ -B'(t) & -A'(t) \end{bmatrix}$$

if  $M$  is the +ve set of eigen values of  $\Delta$   
the  $-M$  is also a set of -ve eigen values of  $\Delta$

So, we can say- if  $M$  is the positive set of eigenvalues of  $\Delta$  then minus  $M$  is also a set of, I can say the negative eigenvalues of  $\Delta$ .

(Refer Slide Time: 11:59)

$$\Delta = \begin{bmatrix} A^{(1)} - B^{(1)} R^{-1} B^{(1)\prime} & \\ -B^{(1)\prime} & -A^{(1)} \end{bmatrix}$$

If  $W$  is the modal matrix

$$W^{-1} \Delta W = D = \begin{bmatrix} -M & 0 \\ 0 & M \end{bmatrix}$$

$$W = \begin{bmatrix} w_{11} & w_{12} \\ w_{21} & w_{22} \end{bmatrix}$$

$\uparrow$                        $\uparrow$   
 eigenvector of  $\Delta$  corresponding to eigenvalues  
 $-M$  and  $M$

So, if I will use the similarity transformation on  $\Delta$  I can convert this  $\Delta$  into the diagonal set of eigenvalues in Jordan canonical form. So if,  $W$  is the modal matrix then the transformation  $W$  inverse  $\Delta$   $W$  is  $D$ . And  $D$  is nothing but can convert  $\Delta$  matrix into the diagonal form. Where,  $M$  is my one set of the eigenvalues then minus  $M$  will be another set of my eigenvalues.

(Refer Slide Time: 12:59)

### Analytical Solution of Matrix DRE

This property of the Hamiltonian matrix results in its ability to diagonalize in the form,

$$D = \begin{bmatrix} -M & 0 \\ 0 & M \end{bmatrix}$$

Where  $M$  is a **diagonal matrix** with diagonal elements as the **positive eigenvalues** of the Hamiltonian matrix.

So, we are considering this  $D$  which is nothing but the set of eigenvalues of  $\Delta$  in diagonal form, where if  $M$  is one set then another set will be the minus  $M$ . So, they can be placed in the diagonal form using the simulative transformation where  $W$  is my model matrix.

(Refer Slide Time: 13:23)

**Analytical Solution of Matrix DRE**

Let ' $W$ ' be the modal matrix that transforms the Hamiltonian matrix into diagonal form.

$$W^{-1}\Delta W = D$$

The modal matrix of eigenvectors may be defined as,

$$W = \begin{bmatrix} W_{11} & W_{12} \\ W_{21} & W_{22} \end{bmatrix}$$

 IIT ROORKEE
  NPTEL ONLINE CERTIFICATION COURSE

So, we can consider this model matrix as  $W_{11}$   $W_{12}$ ,  $W_{21}$   $W_{22}$ : in this the first two terms, sorry the each column will represent the eigenvectors of  $\Delta$ . So, this means if we are considering  $W_{21}$  and  $W_{22}$ . So, each column represent nothing but these are the eigenvectors of  $\Delta$  corresponding to eigenvalues  $M$  and sorry minus  $M$  and  $M$ . So, if I say if these are corresponding to minus  $M$  eigenvalues, this will correspond to the  $M$  eigenvalues. So, corresponding to each eigenvalue we can find out the eigenvector corresponding to that particular eigenvalue and this can be arranged in the following manner: let the first columns represent the negative eigenvalues, the next columns will represent the another eigenvalues.

By this we can generate our model matrix  $W$  which with the transformation as  $W^{-1}\Delta W$  will give us the diagonal form of the  $\Delta$  matrix in which all diagonal elements are nothing but the eigenvalues of  $\Delta$ . So, this is my transformation.

(Refer Slide Time: 15:33)

### Analytical Solution of Matrix DRE

The states of the system are also transformed using the same modal matrix.

$$\begin{bmatrix} \dot{X}(t) \\ \dot{\lambda}(t) \end{bmatrix} = W \begin{bmatrix} \dot{Z}(t) \\ \dot{\Lambda}(t) \end{bmatrix} = \begin{bmatrix} W_{11} & W_{12} \\ W_{21} & W_{22} \end{bmatrix} \begin{bmatrix} \dot{Z}(t) \\ \dot{\Lambda}(t) \end{bmatrix} \quad (11)$$

The transformed Hamiltonian system is given by,

$$\begin{bmatrix} \dot{Z}(t) \\ \dot{\Lambda}(t) \end{bmatrix} = W^{-1} \begin{bmatrix} \dot{X}(t) \\ \dot{\lambda}(t) \end{bmatrix} = W^{-1} \Delta \begin{bmatrix} X(t) \\ \lambda(t) \end{bmatrix} = W^{-1} \Delta W \begin{bmatrix} Z(t) \\ \Lambda(t) \end{bmatrix} = D \begin{bmatrix} Z(t) \\ \Lambda(t) \end{bmatrix} \quad (12)$$

Let us take the simulative transformation as  $X(t) \lambda(t) = W Z(t) \Delta(t)$ . So, this symbol I am calling that  $\Delta$ , and Hamiltonian Matrix I am calling the  $\Delta$ . So, this is  $\Delta(t)$  so I have the two new state  $Z(t)$  and  $\Delta(t)$  which is related to  $x$  and  $\lambda$  with model matrix  $W$ . So, we keep this equation 11 as  $X(t) \lambda(t) = W_{11} W_{12} W_{21} W_{22} Z(t) \Delta(t)$ .

(Refer Slide Time: 16:15)

Transformed Hamiltonian System

$$\begin{cases} \begin{bmatrix} \dot{Z}(t) \\ \dot{\Lambda}(t) \end{bmatrix} = W^{-1} \begin{bmatrix} \dot{X}(t) \\ \dot{\lambda}(t) \end{bmatrix} = W^{-1} \Delta \begin{bmatrix} X(t) \\ \lambda(t) \end{bmatrix} = W^{-1} \Delta W \begin{bmatrix} Z(t) \\ \Lambda(t) \end{bmatrix} \\ \begin{bmatrix} \dot{Z}(t) \\ \dot{\Lambda}(t) \end{bmatrix} = D \begin{bmatrix} Z(t) \\ \Lambda(t) \end{bmatrix} = \begin{bmatrix} -m & 0 \\ 0 & m \end{bmatrix} \begin{bmatrix} Z(t) \\ \Lambda(t) \end{bmatrix} \end{cases}$$

$$\begin{bmatrix} Z(t) \\ \Lambda(t) \end{bmatrix} = \begin{bmatrix} e^{-m(t-t_0)} & 0 \\ 0 & e^{+m(t-t_0)} \end{bmatrix} \begin{bmatrix} Z(t_0) \\ \Lambda(t_0) \end{bmatrix}$$

$$\begin{bmatrix} Z(t_0) \\ \Lambda(t_0) \end{bmatrix} = \begin{bmatrix} e^{m(t-t_0)} & 0 \\ 0 & e^{-m(t-t_0)} \end{bmatrix} \begin{bmatrix} Z(t) \\ \Lambda(t) \end{bmatrix}$$

$Z(t_0) = e^{-m(t-t_0)} Z(t)$   
 $\Lambda(t_0) = e^{m(t-t_0)} \Lambda(t)$

So, the transform Hamiltonian System will be what? This means my transformed Hamiltonian System I am representing as  $Z(t) \Delta(t)$ , what I can write for this as my transformation is  $X(t) \lambda(t) = W Z(t) \Delta(t)$ . So,  $Z(t) \Delta(t)$  I can simply

write as  $W^{-1} X(t) \lambda(t)$ . So, this I am writing as  $X(t) \lambda(t) - X(t) \lambda(t)$  is nothing but my  $\delta X(t) \lambda(t)$ . And again we will apply the transformation so this is nothing but  $W^{-1} \delta W Z(t) \lambda(t)$ .

Or we are simply writing this as  $Z(t) \lambda(t)$  which is nothing but my diagonal matrix  $Z(t) \lambda(t)$  and  $D$  is what as we have known this is nothing but my diagonal matrix, so my transformed Hamiltonian System so this is nothing but my transformed Hamiltonian System. This system we are simply representing as  $Z(t) \lambda(t) = -M Z(t) \lambda(t)$  where  $M$  is nothing but my all diagonal term.

So, if I know this then I can directly write the solution of this equation, which is nothing but  $E$  to the power minus  $M t$ , but I know the some terminal conditions. So, my terminal condition may be the initial conditions or the end point condition. Normally  $\lambda(t_f)$  is my  $p(t_f)$  and  $X(t_f)$  is  $F(t_f)$ . So, my terminal condition if it is known to me so I will write the solution of this equation in terms of the final time this means I am writing the solution of this as  $Z(t) \lambda(t)$  and this I can simply write as  $\lambda(t) = e^{-M(t-t_f)} \lambda(t_f)$  in terms of the terminal time  $t_f$ ; sorry this is plus  $M(t-t_f)$  this is my  $Z(t) \lambda(t)$ , that we can have

(Refer Slide Time: 20:38)

### Analytical Solution of Matrix DRE

The solution of the system of differential equation (12) is given by,

$$\begin{bmatrix} Z(t) \\ \Lambda(t) \end{bmatrix} = \begin{bmatrix} e^{-M(t-t_f)} & 0 \\ 0 & e^{M(t-t_f)} \end{bmatrix} \begin{bmatrix} Z(t_f) \\ \Lambda(t_f) \end{bmatrix} \quad (13)$$

$$\begin{bmatrix} Z(t_f) \\ \Lambda(t) \end{bmatrix} = \begin{bmatrix} e^{M(t-t_f)} & 0 \\ 0 & e^{-M(t-t_f)} \end{bmatrix} \begin{bmatrix} Z(t) \\ \Lambda(t_f) \end{bmatrix} \quad (14)$$

So, we can see it here: we can write this solution in terms of the  $Z(t) \lambda(t)$  and  $\lambda(t)$ . So, this can further be transformed in. So, simply by manipulating the variables on left and the right side I can write this solution in terms of the  $Z(t) \lambda(t)$ . Purposefully we are

doing this, later we will utilize this set- I am want to write this in  $Z$  of  $t_f$  del of  $t$ . So, this I want to write in terms of  $Z$   $t$  and  $\lambda$   $t$   $f$ . So, I can see my last equation remain the same, but the first equation if I will write this is nothing but my  $Z$   $t$  equal to  $E$  to the power minus  $M$   $t$  minus  $t$   $f$   $Z$  of  $t$   $f$ , and now we are writing  $Z$  of  $t$   $f$  in terms of  $Z$  so this is simply  $Z$   $t$   $f$  as  $E$  to the power  $M$   $t$  minus  $t$   $f$   $Z$  of  $t$ . So, my this term will be changed to  $E$  to the power  $M$   $t$  minus  $t$   $f$  and this term remains same  $E$  to the power  $M$   $t$  minus  $t$   $f$ .

So, this solution I am writing in terms of the equation number 14:  $Z$  of  $t_f$  del of  $t_f$  in terms of the  $Z$  of  $t$  del of  $t_f$ . So, we will keep this result and see next.

(Refer Slide Time: 22:31)

### Analytical Solution of Matrix DRE

From the transformation in eqn. (2) and MRE boundary condition (4) we have,

$$\lambda(t_f) = F X(t_f) \tag{15}$$

Substituting eqn. (11) in above eqn.,

$$W_{21} Z(t_f) + W_{22} \Lambda(t_f) = F[W_{11} Z(t_f) + W_{12} \Lambda(t_f)]$$

$$\Lambda(t_f) = -[W_{22} - F W_{12}]^{-1}[W_{21} - F W_{11}] Z(t_f) = T(t_f) Z(t_f) \tag{16}$$

IIT KOORKEE

NPTEL ONLINE  
CERTIFICATION COURSE

We know from the terminal condition my  $\lambda$  of  $t_f$  is nothing but equal to  $F$  of  $t_f$   $X$  of  $t_f$ .

(Refer Slide Time: 22:48)

$$\begin{aligned} \lambda(t_f) &= F(t_f) X(t_f) \\ W_{21} z(t_f) + W_{22} \Lambda(t_f) &= F(t_f) [W_{11} z(t_f) + W_{12} \Lambda(t_f)] \\ [W_{22} - F(t_f) W_{12}] \Lambda(t_f) &= -[W_{21} - F(t_f) W_{11}] z(t_f) \\ \Lambda(t_f) &= \underbrace{[-[W_{22} - F(t_f) W_{12}]]^{-1} [W_{21} - F(t_f) W_{11}]}_{T(t_f)} z(t_f) \\ \Lambda(t_f) &= T(t_f) z(t_f) \\ \Lambda(t) &= e^{m(t-t_f)} \Lambda(t_f) = e^{m(t-t_f)} T(t_f) z(t_f) \\ \Lambda(t) &= \underbrace{e^{m(t-t_f)} T(t_f)}_{T(t)} e^{m(t-t_f)} z(t_f) = T(t) \cdot z(t) \end{aligned}$$

So, we are using the transformation  $\lambda(t)$  as  $F(t) X(t)$ .

Now see: from my equation 11 I can write  $x$  and  $\lambda$  in terms of the  $W_{11}$ ,  $W_{12}$ ,  $W_{21}$ ,  $W_{22}$  with  $Z$  and  $\lambda$ . So, if I will write at the terminal point  $X(t_f)$  is nothing but  $W_{11} z(t_f) + W_{12} \lambda(t_f)$ . And similarly  $\lambda(t_f)$  I can write as  $W_{21} z(t_f) + W_{22} \lambda(t_f)$ . So, in this transformation I am replacing this  $\lambda(t_f)$  as; this is  $W_{21} z(t_f) + W_{22} \lambda(t_f)$ . So, first I am writing the second equation  $W_{21} z(t_f) + W_{22} \lambda(t_f) = F(t_f) [W_{11} z(t_f) + W_{12} \lambda(t_f)]$ . Then similarly  $x(t_f)$  I can also replace, so this is  $F(t_f) X(t_f)$  and  $x$  will be  $W_{11} z(t_f) + W_{12} \lambda(t_f)$ .

So, both side I can collect the terms with  $\lambda(t_f)$  and  $Z(t_f)$  my objective is: this I am writing from equation 11 to represent  $\lambda(t_f)$  in terms of the  $Z(t_f)$ . So, from this equation I am collecting the terms with  $\lambda(t_f)$  first. So, this is  $W_{22} \lambda(t_f) - F(t_f) W_{12} \lambda(t_f)$  and this is nothing with  $\lambda(t_f)$  and this is sorry; and this side we will collect the terms related to my  $Z(t_f)$ . So, this I am writing as if I will take it here  $W_{21} z(t_f) - F(t_f) W_{11} z(t_f)$ .

Now, pre multiplying this with the inverse of this, so I can simply write  $\lambda(t_f)$  as minus pre multiplying with this  $W_{22} - F(t_f) W_{12}$  inverse multiplied with  $W_{21} - F(t_f) W_{11}$   $Z(t_f)$ . And this whole I am writing as  $T(t_f) Z(t_f)$ , where this whole along with the negative sign this we are taking as  $T(t_f)$ . So, this relation gives me a condition which is equivalent to my; see this is relating  $\lambda$  with  $X$  through  $F(t_f)$ .

and this relation is relating my the transformed state variable now which is  $\Lambda(t)$  and the  $Z(t)$ . So, this is giving me the relation between these two.

So, this  $\Lambda(t)$  I am representing simply as  $T(t)Z(t)$  where  $T(t)$  is nothing but minus this whole term- I am taking as the  $T(t)$ .

(Refer Slide Time: 28:12)

### Analytical Solution of Matrix DRE

From eqn. (13) we have,

$$\Lambda(t) = e^{M(t-t_f)} \Lambda(t_f) \quad (17)$$

Substituting (16) in above eqn. results in,

$$\Lambda(t) = e^{M(t-t_f)} T(t_f) Z(t_f) \quad (18)$$

Substituting (14) in above eqn. results in,

$$\Lambda(t) = e^{M(t-t_f)} T(t_f) e^{M(t_f-t)} Z(t) = T(t) Z(t) \quad (19)$$

Now, see by this relation we are writing the value of  $\Lambda(t)$ . So, we can either 13 or 14 I am writing this  $\Lambda(t)$  as  $E$  to the power  $M(t-t_f)$   $\Lambda(t_f)$ . So, this means now my relation is in between  $\Lambda(t)$  and  $Z(t)$ . So, I will write first  $\Lambda(t)$  as the next step I am writing this  $\Lambda(t)$  which is  $M(t-t_f)$  with  $\Lambda(t_f)$ . So, this from equation 13 or 14 we have written from this equation we have written and  $\Lambda(t_f)$  from the previous relation we know is  $T(t_f)Z(t_f)$ . So,  $E$  to the power  $M(t-t_f)$  and  $\Lambda(t_f)$  I am replacing with  $T(t_f)Z(t_f)$ .

And this  $Z(t)$  again from my equation 13 and 14; so this  $Z(t)$  I can represent in terms of the  $z(t)$ . So, this  $\Lambda(t)$  I can simply write as  $E$  to the power  $M(t-t_f)$   $T(t_f)Z(t_f)$  to the power  $M(t-t_f)$  and this  $Z(t)$  is in terms of my  $Z(t)$ . At this I simply representing as  $T(t)Z(t)$ ; like this is the relation at the terminal point, this is the relation at any given point where  $T(t)$  is nothing but given by this expression which is  $T(t)$ .

Now, we have the two transformation one is  $\lambda(t) = P(t)X(t)$  where  $T(t)$  is given by this expression and another is  $\lambda(t) = P(t)Z(t)$  where  $T(t)$  is given by this expression. So, we have established a relation between  $\lambda(t)$  and  $Z(t)$  as  $T(t)$ , where  $T(t)$  is represented by  $P(t)$  to the power  $M(t) - t$  of  $T(t)$   $E$  to the power  $M(t) - t$ .

### Analytical Solution of Matrix DRE

From the basic transformation (2) we have,

$$\lambda(t) = P(t)X(t)$$

Substituting the state transformation eqn. (11) in the above equation,

$$W_{21}Z(t) + W_{22}\Lambda(t) = P(t)[W_{11}Z(t) + W_{12}\Lambda(t)] \quad (20)$$

IIT ROORKEE

NPTEL ONLINE  
CERTIFICATION COURSE

So, another next again we will take the transformation as we know  $\lambda(t) = P(t)X(t)$ .

(Refer Slide Time: 31:41)

$$\lambda(t) = P(t)X(t)$$

$$W_{21}Z(t) + W_{22}\Lambda(t) = P(t)[W_{11}Z(t) + W_{12}\Lambda(t)]$$

$$[W_{21}Z(t) + W_{22}T(t)Z(t)] = P(t)[W_{11}Z(t) + W_{12}T(t)Z(t)]$$

$$[W_{21} + W_{22}T(t)] = P(t)[W_{11} + W_{12}T(t)]$$

For Time Varying Case  $\checkmark$   $P(t) = [W_{21} + W_{22}T(t)] [W_{11} + W_{12}T(t)]^{-1}$

as  $t \rightarrow \infty$   
Infinite horizon case  $\leftarrow P = W_{21} W_{11}^{-1}$

So, in this case as we know we can represent this  $\lambda t$  as  $p$  of  $t$   $X$  of  $t$ . So, this is the relation between  $\lambda t$  and  $X t$  at any given time key. Again from equation number 11 which giving me the expansion of  $I$  can represent my  $\lambda t$  in terms of my transformed state variable  $z$  and  $\Delta$ . So, first I will write for the  $\lambda t$  as  $W_{21} Z t$  plus  $W_{22} \Delta t$  and this is  $p t$  and  $X t$  is as I can see from here my  $X t$  is  $W_{11} j t$   $W_{12} \Delta t$  plus  $W_{21} \Delta t$ .

In this expression I know what is my relation between  $\Delta$  and  $Z t$ ; that previously we have proven that my  $\Delta t$  is nothing but  $T$  of  $t$   $n z t$ .

### Analytical Solution of Matrix DRE

Substituting (19) in (20) results in,

$$W_{21} Z(t) + W_{22} T(t) Z(t) = P(t)[W_{11} Z(t) + W_{12} T(t) Z(t)] \quad (21)$$

Removing  $Z(t)$  and rearranging the above equation to determine  $P(t)$  results in,

$$P(t) = [W_{21} + W_{22} T(t)][W_{11} + W_{12} T(t)]^{-1}$$

Where,

$$T(t) = e^{M(t-t_f)} [-[W_{22} - FW_{12}]^{-1} [W_{21} - FW_{11}]] e^{M(t-t_f)}$$

So, I will replace transform this  $\Delta t$ , so  $W_{21} Z t$  plus  $W_{22}$  this I am transforming into  $T$  of  $t$   $Z$  of  $t$ . Similarly on this side, I am also transforming this  $\Delta t$  in terms of the  $Z t$  plus  $W_{21} T$  of  $t$  and  $Z$  of  $t$ . Now  $Z$  of  $t$  from both side I can take it out and can cancel out. So, this is nothing but I am left with  $W_{21}$  plus  $W_{22} T$  of  $t$  as  $p$  of  $t$   $W_{11}$  plus  $W_{21} T$  of  $t$ , and  $p t$  can be represented as if I will post multiply the whole with the inverse of this term. So,  $p t$  can simply be taken as  $W_{21} W_{22} T$  of  $t$   $W_{21}$  plus  $W_{12}$  this is  $W_{12}$ , this  $W_{12} T$  of  $t$  inverse.

So, by this we can find out the Riccati matrix coefficient  $p t$  with the help of my model matrix which is nothing but the set of eigenvectors which we are dividing into the or we are partitioning into; partitioning at sorry, this  $W_{11}$  we are taking the inverse on this side  $W_{12}$  inverse. We are partitioning is  $W_{11}$   $W_{12}$ ,  $W_{21}$ ,  $W_{22}$ . So, if we can partition this

model matrix we can directly determine what will be my matrix Riccati coefficient. So, we are writing this  $p(t)$  as  $W_{21} W_{22}^{-1} T^T(t)$ ,  $W_{11} W_{12}^{-1} T^T(t)$  whole inverse of this where  $T$  of  $t$  is we are representing by this term.

Now, in this you will see as  $t \rightarrow \infty$ ; so this is for time varying case. As  $t \rightarrow \infty$  I can see this here my  $E$  to the power  $M(t) - t$  this will approach to 0. So, this means my  $t \rightarrow \infty$  this term will become 0 as  $t$  approaches to infinity, this means in this my this term is going to be 0 and this term is going to be 0. So, for infinite horizon my Riccati coefficient matrix is nothing but  $W_{21} W_{11}^{-1}$  and also this will be a constant matrix  $P$ .

So, this is for the time varying case, so this result will be for the infinite horizon case. So, by this approach we can find out the analytical solution of matrix differential equation either for the time varying case or for the time invariant case- for the time varying, finite time horizon and also for the infinite time horizon.

So, this lecture we stop here, and in the next lecture we will discuss about the frequency domain interpretation of the LQR system.

Thank you very much.
