Unique representation theorem

(Refer Slide Time: 00:14)

So, let us prove an important result in linear algebra which is the unique representation theorem. So, I will state the theorem let S be a vector space and T be a subset of this vector space and nonempty. The set T is linearly independent if and only if, I mean there is a forward statement as well as a reverse statement if and only if for each nonzero x belonging to the span of this space T , there is exactly one finite subset of T denoted by p_1, p_2, \dots, p_n and a unique set of scalars c_1, c_2, \dots, c_n such that x can be written as linear combination of all these vectors p_1 to p_n through these scalars c_1 through c_n .

So, before we begin we have to understand what we need to prove. So, there is a forward statement which says linear independence should imply unique representation and then there is a reverse statement which says if it is unique representation then it is linearly independent and that is this if and only if statement. So, let us try to prove both these parts.

(Refer Slide Time: 03:11)

PROOF : Linear independence \Rightarrow Unique Representation

We shall establish this by Contradiction. Let T be a linearly independent set. Let us assume that $\exists x \in \text{span}(T)$ whose representation is not unique. Thus, \exists two subsets of T , namely $P = \{p_1, p_2, \dots, p_m\}$ and $Q = \{q_1, q_2, \dots, q_n\}$ such that

$$x = \sum_{i=1}^m c_i p_i = \sum_{i=1}^n d_i q_i$$

where c_i 's and d_i 's are non zero.

Let us rearrange the terms in the representation for x .

So, to prove this part we shall establish this by contradiction. Let T be a linearly independent set. Let us assume that there exist x is a nonzero vector belonging to the span of T whose representation is not unique and this is where we have to establish this result. Thus, there exist 2 subsets of T namely a set P which is comprising of vectors p_1, p_2, \dots, p_m of $x \in \text{span } T$, Q having q_1, q_2, \dots, q_n . The Q is span T see the difference between m and n here such that x can be written in 2 forms one using the set P and other using set Q . So, x is basically a linear combination of vectors from the set P and we said that this representation is not unique so therefore, we are using another combination using vectors q_i and associated scalars d_i of i , where I think I have to make a point here c_i and d_i are nonzero.

Now, let us rearrange the terms in representation of x that is whatever we have written down here. So, let us rearrange the terms in the representation for x .

(Refer Slide Time: 07:25)

The image shows a screenshot of a Notepad window with the following handwritten text:

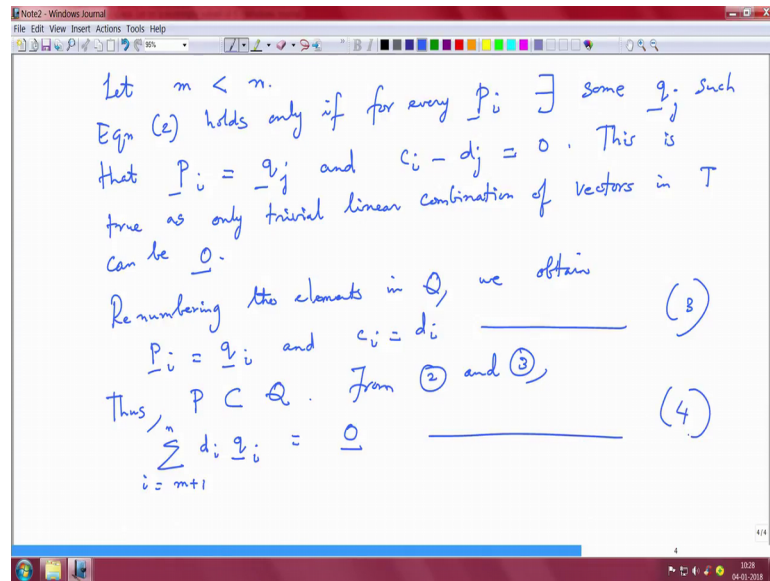

$$\sum_{i=1}^m c_i \underline{p}_i - \sum_{i=1}^m d_i \underline{q}_i = \underline{0}$$

As \underline{p}_i 's and \underline{q}_i 's belong to T , if $P \cap Q = \phi$ then \underline{p}_i 's and \underline{q}_i 's are different. This contradicts the fact that T is a linearly independent set as their non-trivial linear combination cannot sum to zero. Hence, there must be some overlap between the two sets.

So, what we get is $\sum_{i=1}^m c_i \underline{p}_i - \sum_{i=1}^m d_i \underline{q}_i = \underline{0}$. Now, as \underline{p}_i 's and \underline{q}_i 's belong to T right if $P \cap Q = \phi$ then \underline{p}_i 's and \underline{q}_i 's are different. So, this contradicts the fact that T is linearly independent set as their non-trivial linear combination cannot sum to 0. Hence there must be some overlap between the 2 sets right.

As \underline{q}_i 's and \underline{p}_i 's belong to T if the intersection of P and Q is a null set then \underline{p}_i 's and \underline{q}_i 's are different this contradicts the fact that T is a linearly independent set as their non-trivial combination cannot sum to 0. So, therefore, there must be some overlap between these sets. So, let us proceed further.

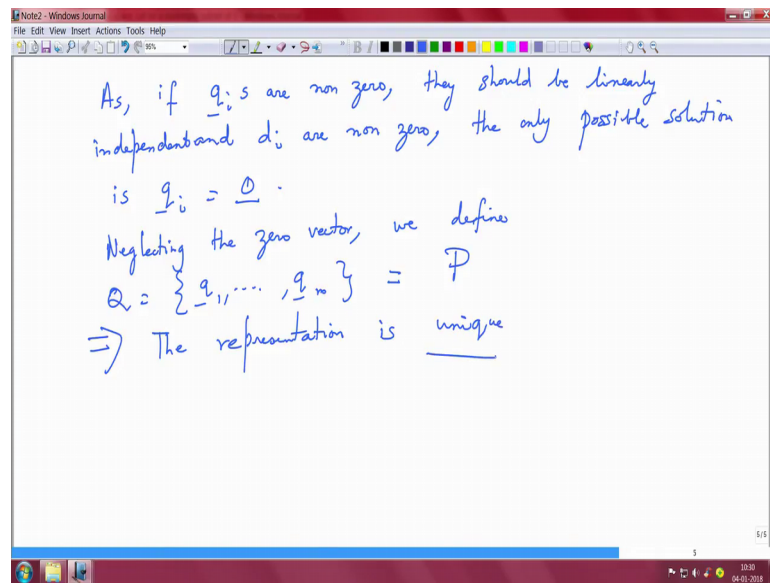

(Refer Slide Time: 10:01)

Let m be less than n right because there must be reasons there is some overlap and m be less than n without loss of generality. Now, call this equation before equation 2 and possibly the first equation that we have in the theorem we can just call this equation one. So, equation 2 holds only if for every p_i of x_i there exists some q_j of x_j such that p_i 's of x_i equals q_j of x_j and $c_i - d_j$ vanishes. This is true as only trivial linear combination of vectors in T can be 0 .

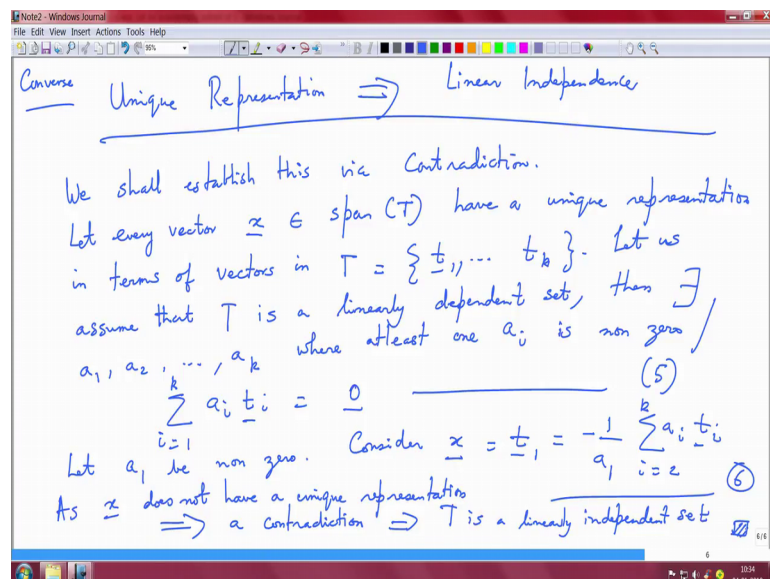

Now remembering the elements in q we obtain say p_i of x_i is q_i of x_i we can just label this and then c_i . So, scalar c_i equals d_i thus the set p is part of the set q let us just call this, this equality here as equation 3. So, from 2 and 3 we land up with summation i going from $n + 1$ to n , $d_i q_i$ of x_i is basically this 0 vector. So, let us call this equation number 4.

(Refer Slide Time: 13:23)

So, as if q_i are nonzero they should be linearly independent and d_i or nonzero, therefore, the only possible solution is q_i being this 0 vector. So, therefore, if we neglect the 0 vector we define the set q is basically q_1 so on till q_m which is basically this set p which phase arrived at because p_i equals q_i for i equals 1 to m and therefore, the representation is unique.

(Refer Slide Time: 15:09)

So, let us get to the other part which is, if we have a unique representation does it imply linear independence. So, again we shall establish this through contradiction. Let every

vector x belonging to span of this set T have a unique representation in terms of vectors in the set T comprising of say t_1 to some t_k . Let us assume that T is a linearly dependent set then there exists a_1, a_2, \dots, a_k , where at least one a_i is nonzero such that this linear combination is a 0 vector.

Let a_1 be nonzero consider and call this equation 5. Consider x which is equal to t_1 say suppose and this is given by minus 1 upon a_1 summation i equals to $2, \dots, k, a_i t_i$. Now, as x does not have a unique representation this implies a contradiction because we assume that it has a unique representation so therefore, T is a linearly independent set and this completes the proof of this theorem. We will stop here.
