

**Electronic Systems for Cancer Diagnosis**  
**Dr. Hardik J. Pandya**  
**Department of Electronic Systems Engineering**  
**Indian Institute of Science, Bangalore**

**Lecture - 45**  
**3D-printing: Introduction and Work Flow**

Hi, welcome to this module. In this module, what we will look at we will look at how 3D-printing works. Now, what exactly 3D-printing is, and what do you mean by additive manufacturing and subtractive manufacturing. How 3D-printing can be used ah to as a casing for the electronic systems, so as to see ah working prototype for understanding the cancer there, because our silt focus is on understanding or diagnosing cancer using electronic systems. But when we design fabric or fabricate chip, we have to enclose that chip inside a casing and thus 3D-printing can be extremely important ah tool to learn.

(Refer Slide Time: 01:22)

The slide features two logos at the top: the Indian Institute of Science logo on the left and the Department of Electronic Systems Engineering logo on the right. The main title is "Electronic Systems for Cancer Diagnosis" and the subtitle is "Application Of 3d-printing Technology in Sensor Fabrication". The instructor's name, "Instructor: Hardik J. Pandya", is listed at the bottom right. A small number "1" is visible in the bottom right corner of the slide.

So, if you see here the, these today's focuses on application of 3D-printing technology in sensor fabrication.

(Refer Slide Time: 01:29)

**INTRODUCTION**

- 3D printing is also known as **additive manufacturing**
- A process of making three dimensional solid objects from a digital file
- Additive process
  - The desired object is created by laying down successive layers of material until the object is created.
  - Each of these layers can be seen as a finely sliced horizontal cross-section of the eventual object.
- 3D printing is the opposite of **subtractive manufacturing** which is cutting out / hollowing out a piece of metal or plastic, example: milling machine.
- 3D printing enables you to produce complex (functional) shapes using less material than traditional manufacturing methods.

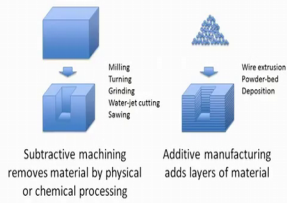

Image Source : <https://3dexter.com/additive-manufacturing-vs-subtractive-manufacturing/>

So, if you start with the introduction, the 3D-printing is defined also known as the additive manufacturing process, process for making three-dimensional solid objects from a digital file. So, what exactly additive manufacturing means right. So, if you see here in this two particular case shown in the schematic, the add, additive manufacturing, subtractive manufacturing shown here. In subtractive manufacture, if you take a block, if you take a block and you remove a part of block by physical or chemical processing either, it can be milling, it can be turning, it can be grinding, it can be water jet cutting, it can be sawing right. So, in any way when you are cutting the things from block, it is a subtracting that material, so subtractive manufacturing.

For adding a material to a block, for example, right over here right adding manufacturing additive manufacturing adds layers of material, and that layer is deposited using the wire extrusion power bed deposition technique right, which we will also see as a 3D manufacturing process. So, when you add the material, additive manufacturing, when you remove the material subtractive manufacturing to in a very easy way to understand. So, what additive processes the desired object is created by laying down successive layers of material until the objectives created.

So, in, in this particular process, where we talk about additive manufacturing, the object is created by laying down successive materials as you can see layer by, layer in horizontal way, a layer by layer can be used in vertical way. So, we will see the

advantages of those some sometime later, but right now each of these layers can be seen as finely sliced horizontal cross section. In this particular schematic, it can be seen as a finely sliced horizontal cross section right, while repainting is the opposite of subtractive manufacturing, where the cutting or hollowing out a piece of metal or plastic, example milling or machining I just explained you.

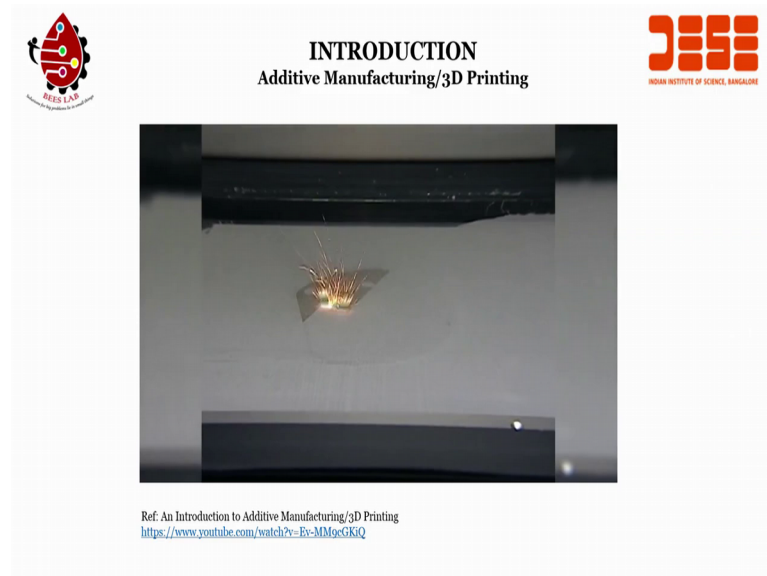

Now, the 3D-printing enables, you to provide or produce complex functional shapes using less material than traditional manufacturing methods. That is the added advantage of 3D-printing over traditional manufacturing processes, where the material conception is less for making complex ah shapes.

(Refer Slide Time: 03:56)

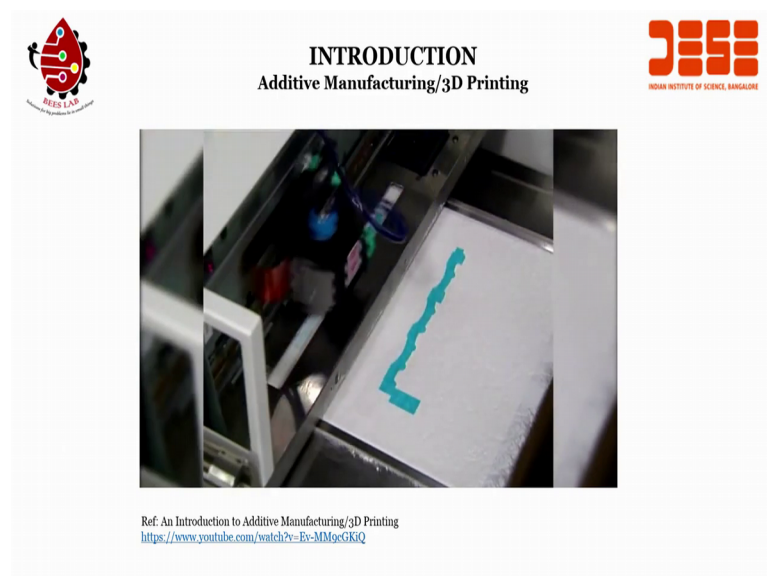

So, this is ah about the 3D, 3D printing introduction. Now, let us quickly see in a video, how exactly 3D-printing works, and it is a actually it is a the introduction to additive manufacturing.

(Refer Slide Time: 04:25)

The slide features the IISc logo on the left and the IISc emblem on the right. The title 'INTRODUCTION Additive Manufacturing/3D Printing' is centered at the top. The main image shows a laser cutting process on a metal sheet, with bright sparks emanating from the cut. Below the image, a reference link is provided: 'Ref: An Introduction to Additive Manufacturing/3D Printing <https://www.youtube.com/watch?v=Ev-MMGcGKIQ>'.

(Refer Slide Time: 04:40)

The slide features the IISc logo on the left and the IISc emblem on the right. The title 'INTRODUCTION Additive Manufacturing/3D Printing' is centered at the top. The main image shows a close-up of a 3D printed part, which is a blue, L-shaped object, resting on a white surface. Below the image, a reference link is provided: 'Ref: An Introduction to Additive Manufacturing/3D Printing <https://www.youtube.com/watch?v=Ev-MMGcGKIQ>'.

So, let me play the video, and then we go to the next slide. Additive manufacturing in 3D-printing are general terms encompassing of variety of system, which is to create three-dimensional physical parts and models directly from digital data. These systems primarily manufactured using a layer by layer or additive means of construction.

(Refer Slide Time: 04:55)

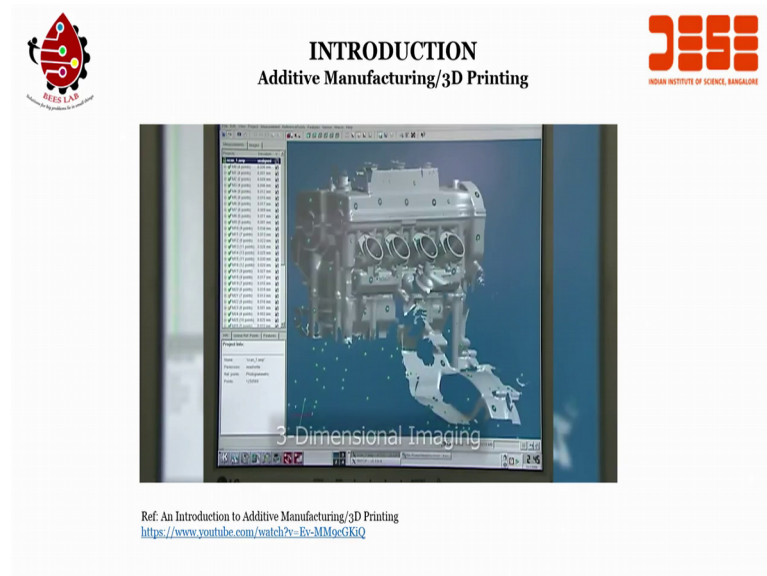

Additive technologies are based on the solid modeling portion of Computer Aided Design or CAD. Additive systems use this solid modeling data to build in extremely thin cross sectional layers.

(Refer Slide Time: 05:16)

This permits manufacture of intricate and complex shapes and surfaces much more simpler than by conventional methods.

(Refer Slide Time: 05:28)

Pieces can also rebuilt from three-dimensional imaging data generated by 3D scanning or medical imaging devices.

(Refer Slide Time: 05:40)

Materials used in additive manufacturing are broadly classified as either liquid.

(Refer Slide Time: 05:49)

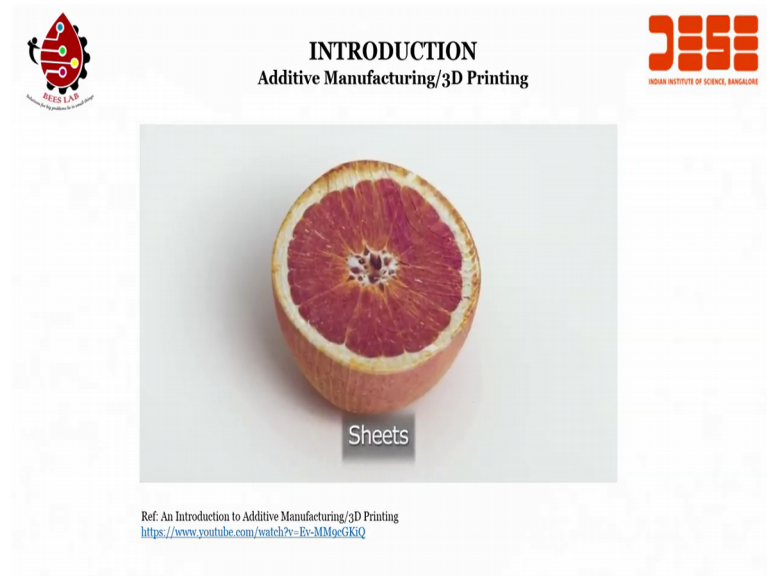

Powder.

(Refer Slide Time: 05:53)

Filament.

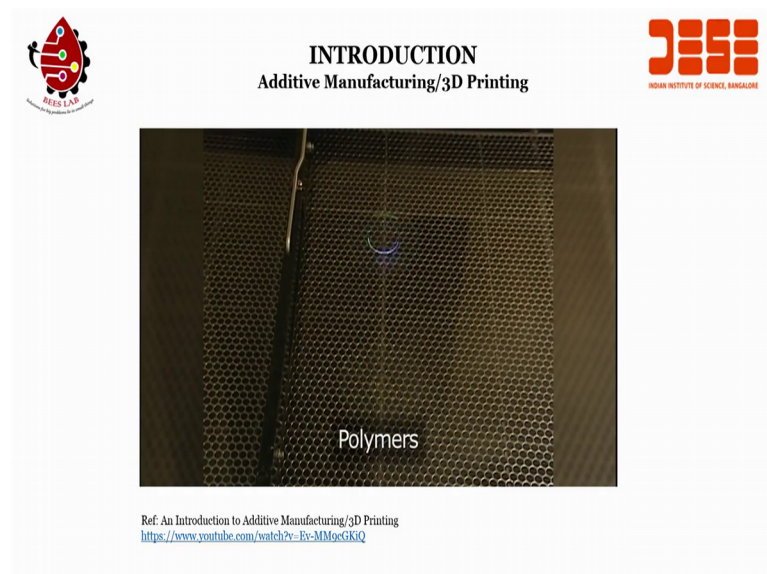

(Refer Slide Time: 05:56)

The slide features a central image of a cross-section of an orange, with the word "Sheets" written in a white box at the bottom center of the image. The slide is framed by logos for "REES LAB" (top left) and "INDIAN INSTITUTE OF SCIENCE, BANGALORE" (top right). The title "INTRODUCTION Additive Manufacturing/3D Printing" is centered at the top. At the bottom, a reference link is provided: "Ref: An Introduction to Additive Manufacturing/3D Printing https://www.youtube.com/watch?v=Ev-MMGcGKIQ".

Or Sheets.

(Refer Slide Time: 06:01)

The slide features a central image of a close-up view of a metal mesh or honeycomb structure, with the word "Polymers" written in a white box at the bottom center of the image. The slide is framed by logos for "REES LAB" (top left) and "INDIAN INSTITUTE OF SCIENCE, BANGALORE" (top right). The title "INTRODUCTION Additive Manufacturing/3D Printing" is centered at the top. At the bottom, a reference link is provided: "Ref: An Introduction to Additive Manufacturing/3D Printing https://www.youtube.com/watch?v=Ev-MMGcGKIQ".

Polymers are the primary type of materials used in additive manufacturing.

(Refer Slide Time: 06:08)

But systems are available to build with plaster.

(Refer Slide Time: 06:13)

Metals.

(Refer Slide Time: 06:17)

Silica Sand.

(Refer Slide Time: 06:21)

Paper.

(Refer Slide Time: 06:24)

Ceramics.

(Refer Slide Time: 06:27)

And even biological materials.

<https://www.youtube.com/watch?v=Ev-MMocGKiQ>

The slide features a central image of a single 3D printed spinal insert. It has a complex, curved shape with a porous, lattice-like texture. The slide is framed by the REES LAB logo on the left and the IISc logo on the right.

Medical implants.

(Refer Slide Time: 07:34)

The slide features a white background with a red logo on the top left and the IISc logo on the top right. The central text reads "INTRODUCTION Additive Manufacturing/3D Printing". Below this is a black rectangular image showing three white, 3D-printed knee surgical guides. The text "Knee Surgical Guide" is centered below the image. At the bottom, a reference is provided: "Ref: An Introduction to Additive Manufacturing/3D Printing" with a URL: <https://www.youtube.com/watch?v=Ev-MMocGKiQ>

Surgical guides.

(Refer Slide Time: 07:35)

The slide features a white background with a red logo on the top left and the IISc logo on the top right. The central text reads "INTRODUCTION Additive Manufacturing/3D Printing". Below this is a black rectangular image showing a glowing, cube-shaped lamp made of many thin, white, 3D-printed rods. The text "Chaos Lamp" is centered below the image, with "Designed By Strand & Hvass" in smaller text underneath. At the bottom, a reference is provided: "Ref: An Introduction to Additive Manufacturing/3D Printing" with a URL: <https://www.youtube.com/watch?v=Ev-MMocGKiQ>

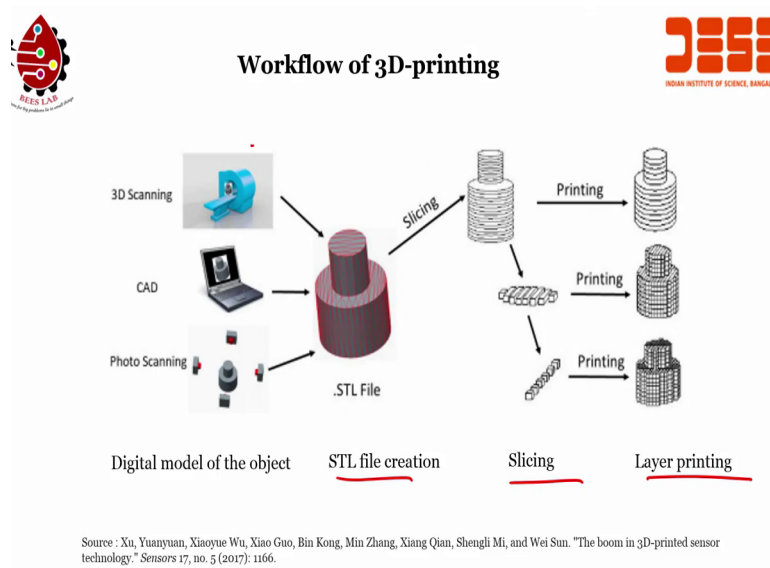

(Refer Slide Time: 07:38)

Home decor art and so much more..

So, as you have seen in the video right, ah how the additive manufacturing works.

(Refer Slide Time: 07:54)

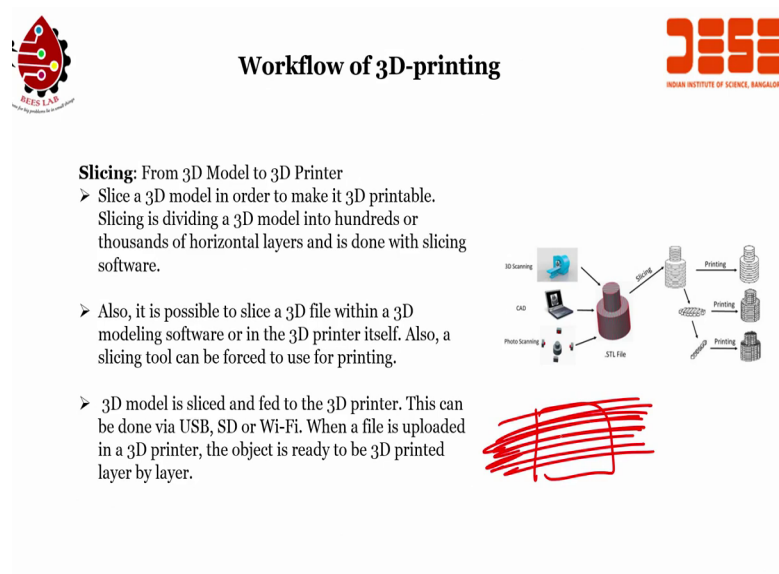

Let us also understand what is a workflow of 3D-printing. If you see here in the slide, what do you see that you have, if you want to have then there are multiple ways of you know generating STL file, either you use photo scanning technique or you use CAD tool or you can use 3D scanning. When you one of this digital model of a object is there, you

can convert it to STL file, and then you can use as a for a slicer for the printing ah you know a , in the finally, there is a layer printing.

So, it goes from digital mode to STL file to slicing and finally, layer printing. These are the steps to that when one is to follow. And you can see details about this particular slicing process and designing the 3D printed part in a paper by Zoe Chile, which is on the boom in the 3D printed sensor technology. So, if you read this article further, you will understand ah the workflow of 3D-printing in detail.

(Refer Slide Time: 08:57)

The slide is titled "Workflow of 3D-printing" and features logos for "RES LAB" and "INDIAN INSTITUTE OF SCIENCE, BANGALOR". It contains a list of bullet points under the heading "Slicing: From 3D Model to 3D Printer". To the right of the text is a diagram showing the workflow from 3D Scanning, CAD, and Photo Scanning to a 3D model, which is then sliced into layers and printed. A red scribble is present at the bottom of the diagram area.

**Workflow of 3D-printing**

**Slicing: From 3D Model to 3D Printer**

- Slice a 3D model in order to make it 3D printable. Slicing is dividing a 3D model into hundreds or thousands of horizontal layers and is done with slicing software.
- Also, it is possible to slice a 3D file within a 3D modeling software or in the 3D printer itself. Also, a slicing tool can be forced to use for printing.
- 3D model is sliced and fed to the 3D printer. This can be done via USB, SD or Wi-Fi. When a file is uploaded in a 3D printer, the object is ready to be 3D printed layer by layer.

It is always good habit to read as many articles as you can, because that is how you improve your knowledge and understand what is going on in the area of science and research. So, now, with continuing the workflow of 3D-printing, what exactly slicing? Slicing is from 3D model to 3D printer. Slice is a 3D model in order to make it a 3D printable version. Now, the slicing in particular is divided or is a process where it or you can say the slicing is dividing 3D model into hundreds or thousands of horizontal layers and is done with slicing software.

So, you take a do you take a block, and then you keep on slicing it right as many layers as you can get right and that is done by the software. Also it is possible to slice a 3D file with a 3D modeling software or in the 3D printer itself. Also, a slicing tool can be forced to use for 3D-printing. 3D model is sliced and fed to 3D printer. This can be done via

USB, SD card or Wi-Fi. When a file is uploaded in the 3D printer, the object is ready to be 3D printed layer by layer.

This whole process how it happens is in this particular text.

(Refer Slide Time: 10:09)

### 3D Modeling Software

Rank	Software	General		3D Printing Community				Total Score

- 3D modeling software are often made to suit the functions of the user's industry.
- Resulting in the rise of software's suited to specific niches.
- As a result, there are software applications on the market that cater to broad range of industries ex. aerospace, transportation, electronic device packaging, 3D printed sensor technology and many others.

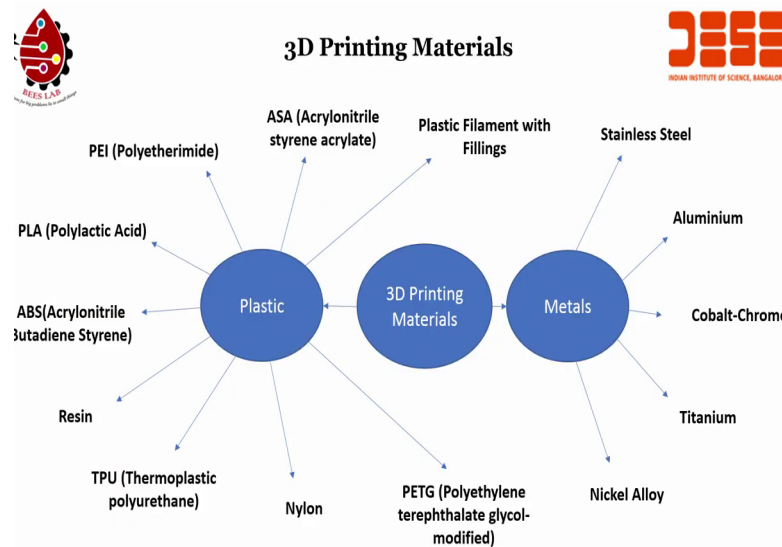

<https://i.materialise.com/blog/en/top-25-most-popular-3d-modeling-design-software-for-3d-printing/>

If we go to the next slide, what we see is there are several 3D model, 3D modeling software. 3D modeling software are often made to suit the functions of the user industry. Resulting in the rise of software suited to specific niches or niche. We, we see that as a result there are software applications on the market that cater to broad range of applications for industries, where we can take a example of aerospace industry, or you can say a packaging industry for electronics, or transportation industry, it can be a sensor printing technology using 3D-printing and so on and so forth. While when you talk about different software that are available for the 3D modeling, those are listed here, where the blender is the blender is ranked 1 by with a total score of 83.

Now, how you can get this total score? This is again based on the vocalized-noise] social website forum YouTube models, Google and so from social forum website forum, YouTube models, Google everything in general the total score comes to 83.7. Where you go down you can have different other software for example, Sketchup, SolidWorks, Fusion, Inventor, Maya, AutoCAD, 3DS Max, ZBrush right and TinkerCAD. So, lot of softwares you are already using, the most common software, we generally we use are the first three, where you are using a Blender or the Sketchup or SolidWorks. Now if you if

you have a mechanical engineering friend, you can ask those people they generally rely on solid works or Pro E to design this as a software of course, lot of things, you need to worry on is on how to convert that particular file to a STL file. So, you can use the existing software for 3D mode modeling.

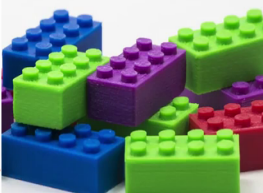

(Refer Slide Time: 12:05)

Now, if I go further what I see is that when you talk about 3D-printing materials see one is to convert your design using a particular software, but then what kind of material you want as a 3D-printing, on the 3D-printing product. So, for that, there are several materials available. When you talk about plastic then you can have setting from thermoplastic to Resin to ABS to PLA right to PEI, ASA, Plastic Filament with Fillings, lot of materials a including Nylon, PTG right. So, in terms of polymer or plastic, there are lot of options. When you talk about metals, there is a 3D-printing metal based 3D printer with where, where it prints the metal. And what kind of metals we can print? We can pin nickel, we can print Titanium, we can print cobalt, we can print Aluminium, and we can print Stainless Steel.

So, excuse me, when you talk about 3D-printing materials it can be either plastic or it can be metals. Now, as you see that in plastic there are several options available; same way in metal also there are several options available. The3D printer that uses plastic as a material is cheaper compared to the one which prints the metal.

(Refer Slide Time: 13:24)

 <b>(Polylactic Acid)</b>	<b>3D Printing Materials (Plastics)</b>	 <b>Nylon</b>
		
<p>Objects printed using PLA material</p> <p>PLA (FDM) is used for low-cost, non-functional prototyping. Offers greater detail than ABS, but is more brittle. Unsuitable for high temperature applications.</p>	<p>LEGO bricks printed using ABS material</p> <p>ABS (FDM) has good mechanical properties, with excellent impact strength, superior to PLA, but less defined details. Commonly used for enclosure prototypes.</p>	<p>Gears printed using Nylon material</p> <p>Used to substitute functional injection moulded parts, good chemical resistance. Perfect for functional applications. Nylon or polyamide (PA) is a thermoplastic with excellent mechanical properties, high chemical and abrasion resistance.</p>
<p>Source: Solidworks.co.in, sharebot.it, simplify3d.com</p>		

So, let us understand further. When you talk about plastics right, so you can see here objects printed using a PLA material beautiful boat. So, this is a PLA is used for low cost non-functional prototyping. Offers greater details than ABS, but it is more brittle, so unsuitable for high temperature applications.

So, it is better than ABS for a certain reason, how about from in terms of detailing, but is more brittle and also not useful for high temperature. While if you understand the ABS material, then ABS has a good mechanical properties with excellent impact strength, superior to PLA, but less defined details. Commonly used for enclosure prototypes. If you see this one is as a less defined details compared to this finishing product. The advantage here is that in case of ABS, we have a higher mechanical, you know properties and thus the strength.

Now, people also have started using the gears using Nylon materials. So, you, you use to substitute functional injection mold parts, good chemical resistance, advantage of Nylon is it can be a good chemical resistance, perfect for functional applications. Nylon or polyamide which is PA with the thermoplastic with excellent mechanical properties, high chemical and abrasion resistance. And thus if you use nylon over for when, when there are the when you have to use this material further in any kind of chemical or you know whether is a more mechanical properties that you need to study, for example, you are applying lot of force or you are stretching the material, then compared to ABS and PLA,

nylon can work as an alternative material. Again you can understand this, the details from the source that is given in this particular link.

(Refer Slide Time: 15:17)

**3D Printing Materials (Plastics) Cntd.**

**Resin**

3D Printing resin, object printed using resin

High detail and smooth surface, injection mold-like prototyping. Resins are thermoset photopolymers that solidify when exposed to light, producing high detail parts with a smooth, injection mold-like surface finish.

**PETG (Polyethylene terephthalate glycol-modified)**

Object printed using PETG material

Good for mechanical parts with high impact resistance and flexibility. Sterilizable. PETG is a thermoplastic with improved properties over PLA, with high impact resistance and excellent chemical and moisture resistance. PETG can be sterilized.

**TPU (Thermoplastic polyurethane)**

Tires printed using TPU material

Rubber-like material, suitable for tubes, grips, seals and gaskets. TPU is a thermoplastic elastomer with low Shore Hardness and a rubber-like feel that can be easily flexed and compressed.

Source: formslab.com, prodways.com, designify.com

So, further if I go I see that other materials are Resin, a PETG with which stands for Polyethylene terephthalate glycol modified and as well as we have TPU, which is Thermoplastic polyurethane. So, the 3D-printing resin object printed using resin, we see here right, and here the high detail and smooth surface, injection mold-like prototyping. So, it is really good, because injection molding is where you can exactly get the working prototype. Not only working prototype, it looks like a product. Resins are thermo state photo polymer say solidifies solidify when exposed to light producing high detail paths with smooth injection more like surface finish.

So, if you use resin you will have a better surface finish. But if you go for object printed using PETG material, what you see is that it has a good mechanical parts with high impact resistance and flexibility. It can be sterilizable, and thus it can be used further is a robots that are used for operating a patient. PETG is a thermoplastic with improved properties over PLA with high impact resistant excellent, chemical and moisture resistance. Also the biggest advantage of using PETG is that it can be sterilized. Thus it can be used in the medical domain.

If you move to TPU, then rubber like material mostly suitable for tubes, grips, seals and gaskets. TPU is a thermoplastic elastomer with low shore hardness and a rubber-like feel

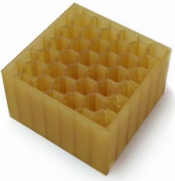

that can be easily flexed and compressed. Thus you can see here image where you can press it and it, it is compressible and thus it can be more like for a gripper. For example, I will give you an example where you want to pick a object, and if you make a hand using rubber right the, the way to pick a object becomes easier or you can say a gripper you can design with the help of TPU.

(Refer Slide Time: 17:23)

### 3D Printing Materials (Plastics) Cntd.

<p><b>ASA (Acrylonitrile styrene acrylate)</b></p>  <p>3D printed plug point using ASA for outdoor use</p> <p>UV stability and high chemical resistance, preferred material for outdoor applications. ASA is a thermoplastic with properties similar to ABS but with improved thermal, chemical and weather resistance. Perfect for outdoor applications.</p>	<p><b>PEI (Polyetherimide)</b></p>  <p>Honeycomb structure made using PEI material</p> <p>Engineering plastic, high performance applications, flame retardant. PEI is an engineering thermoplastic with good mechanical properties and exceptional heat, chemical and flame resistance.</p>	<p><b>Plastic Filament with Fillings</b></p>  <p>Object printed using wood filled PLA, metal filled PLA</p> <p>The above objects are printed using plastic filament with filling material. The fillings alters the property of 3D printed object and used for various applications. Fillings can be wood (Wood Filament), Metal (Metal filled filament) or Carbon Fibre (Carbon Fibre filled filament), etc.</p>
--	--	--

Source: stratasy.com, designifying.com, gearbest.com

So, if I go to the next one, I still have some more materials to show it to you. The first one is ASA, which stands for Acrylonitrile styrene acrylate. And this is UV stability and has a high chemical resistance. It is preferred material for outdoor applications. You can right over see here, so this is one of the application. ASA is thermo plastic with property similar to ABS, but with improved thermal chemical and whether resistance, perfect for outdoor applications. When we talk about PEI, which is Polyetherimide, you can use it as an engineering plastic, high performance application,. It can be used as a flame retardant. PEI is a engineering thermoplastic with good mechanical properties and exceptional heat, chemical and flame resistance all right. So, if you want to use in, in certain application, where you, your temperature is little bit higher or there is a lot of chemical reaction, then you can use this particular material called PEI.

While the Plastic Filament with Fillings,. That is object printer using wood field PLA metal field PLA. And here the above objects are printed using plastic filament with filling materials. The filling alters the properties of 3D printed objects and useful various

applications. Filling can be wood, can be metal or can be carbon fiber. So that is the, that is how the plastic filament can be used as a filling.

(Refer Slide Time: 18:58)

**Stainless Steel**

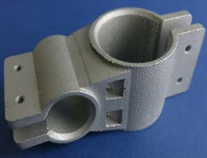

3D printed fork, knife and spoon

High tensile strength, temperature and corrosion resistance. Stainless steel is a metal alloy with high ductility, wear and corrosion resistance that can be easily welded, machined and polished.

### 3D Printing Materials (Metals)

**Aluminium**

3D printed Aluminium clamp

High machinability and ductility, good strength-to-weight ratio. Aluminum is a metal with good strength-to-weight ratio, high thermal and electrical conductivity, low density and natural weather resistance.

**Cobalt-Chrome**

Teeth crown 3D printed in Cobalt-Chrome material

Super alloy used in extreme environments, aerospace and biomedical applications. Cobalt-chrome (CoCr) is a metal super-alloy with excellent strength and outstanding corrosion, wear and temperature resistance.

Source: 3dsystems.com, sculpteo.com, cmfurnaces.com

Further, when we go for other materials, now, this all the above where all plastic right. But if we talk about metals and 3D-printing materials using metals, then first one is that comes to our mind is Stainless Steel. And with Stainless Steel, we can print fork, knife and spoon, high tensile strength, temperature and corrosion resistance. You know that stainless steel is a metal alloy with high ductility where and corrosion resistance there can be easily welded machined and polished. So, this is about steel.

When you talk about Aluminium, the advantage of Aluminium generally is its lighter weight. So, high mechanical ability and ductility, good strength-to-weight ratio, Aluminium is a metal with a good strength-to-weight, ratio high thermal and electrical conductivity, low density and natural weather resistance. So, that is a, this is a 3D printed aluminium clamp, while you talk about Cobalt-Chrome, then what you see here is that Teeth crown 3D printed in Cobalt-Chrome material is right shown in the schematic by super alloy used in extreme environments, aerospace and biomedical applications ah this material is used. Cobalt-Chrome also called as CoCr is a metal super alloy with excellent strength and outstanding corrosion, wear and temperature resistance. So, depending on a type of metal that you choose the application also changes.

(Refer Slide Time: 20:22)

 **3D Printing Materials (Metals) Cntd.** 

**Titanium**

3D printed compressor blade

Used in aerospace, automotive and medical industries, excellent strength-to-weight ratio. Titanium is a metal with excellent strength-to-weight ratio, low thermal expansion and high corrosion resistance that is sterilizable and biocompatible.

**Nickel Alloy**

3D printed connector rod

Nickel alloys used in extreme environments, aerospace applications. Nickel alloys (Ni) have excellent strength and fatigue resistance. Can be used permanently at temperatures above 600°C.

Finally, if we talk about Titanium and nickel, you, you are extremely familiar, I am hoping that you are extremely familiar with Titanium, where you can make lot of it can be used in lot of application including aerospace, automotive, medical industries, excellent strength-to-weight ratio is the advantage of Titanium. Titanium is a metal with excellence strength-to-weight ratio, lower thermal expansion, higher corrosion resistance. Also it is sterilizable and it is a biocompatible material that is can be used as an implant. So, for the implant we can use Titanium.

If you go to the next one, which is Nickel Alloy, what you find is this is a 3D printer connected rod. Nickel Alloys, is used in extreme environments. The examples are aerospace applications. Nickel alloys have excellent strength and fatigue resistance. Can be used permanently at temperatures about 600 degree Centigrade. That is the advantage of nickel alloy.

**Techniques involved in fabrication of 3D components**

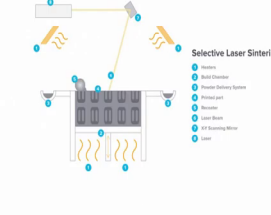

**FDM (Fused Deposition Modelling)**

FDM is the most widely available 3D printing process, mainly used for low-cost prototyping and design verification with very fast turn around times.

**SLA (Stereolithography)/ DLP (Digital Light Processing)**

SLA is most suitable for visual applications where an injection mold-like, smooth surface finish, and a high level of feature detail are required.

**SLS (Selective Laser Sintering)**

SLS is used for both prototyping and small-batch production of functional plastic parts with good mechanical properties.

Thus these are the metals that are generally used for 3D-printing right.

But if I talk about the ah techniques involved in fabrication 3D components, then you will see that how 3D how different techniques can be used for, for printing 3D for, for pinning different materials using 3D printer. So, we will talk about techniques in the next module. For this module let us just end it right over here that what are the different materials that are used in 3D-printing technology, what exactly 3D-printing is, what is

additive manufacturing what is subtractive manufacturing ok. So, in the next module, we will see the techniques for 3D-printing.

Till then you take care, I will see you next class. Bye.
