SDG 12

ENSURE SUSTAINABLE CONSUMPTION AND PRODUCTION PATTERNS

THE GLOBAL MATERIAL FOOTPRINT IS RAPIDLY GROWING, OUTPACING POPULATION AND ECONOMIC GROWTH

DEVELOPED COUNTRIES USE ONE FIFTH OF NATURAL RESOURCES TO PRODUCE THE SAME AMOUNT OF ECONOMIC OUTPUT AS DEVELOPING COUNTRIES

60% HIGHER
MATERIAL FOOTPRINT PER CAPITA IN HIGH-INCOME COUNTRIES COMPARED TO MIDDLE-INCOME COUNTRIES

13 TIMES
MATERIAL FOOTPRINT PER CAPITA IN HIGH-INCOME COUNTRIES COMPARED TO LOW-INCOME COUNTRIES

NEARLY 100 COUNTRIES ARE ACTIVELY ADOPTING POLICIES AND MEASURES TO PROMOTE SUSTAINABLE CONSUMPTION AND PRODUCTION

Environmental deterioration has followed economic and social advancement throughout the past century, jeopardising the very systems that are essential to human existence and continued growth. It will be necessary to alter consumption and production habits in order to prevent the ecosystem from suffering irreparable harm.

UN SDGs - Module 6

35

Dr. Shiva Ji
IIT Hyderabad, India

So with respect to SDG 12, the global material footprint is rapidly growing. Outpacing population and economic growth. Developed countries use 1 fifth of natural resources to produce same amount of economic output as developing countries.

That means, there are many developing countries, a few developed countries. So there is a gap between the investment and production in both the countries, developed and developing. So there is a disparity.

Material footprint per capita in high-income countries is 60 percent higher than in upper-middle income countries and more than 13 times the level of low-income countries. So see the disparity. Nearly 100 countries are actively adopting policies and measures to promote sustainable consumption and production.

So environmental deterioration has followed economic and social advancement. So at the cost of environment, well this has primarily grown, somewhat this has also grown throughout the past century, jeopardizing the very systems that are essential to human existence and continued growth. It will be necessary to alter consumption and production habits in order to prevent the ecosystem from suffering irreparable harm.

(Refer Slide Time: 1:46)

■ SDG 12

Additionally, residential energy usage accounts for 29% of worldwide energy consumption and 21% of CO₂ emissions among consumers. Businesses should look for innovative solutions that support sustainable patterns of consumption and production. It is necessary to have a greater awareness of how products and services influence the environment and society, both in terms of how long they last and how lifestyle choices affect how they are used.

UN SDGs - Module 6

36

Dr. Shing Ji
IIT Hyderabad, India

Additionally, residential energy uses accounts for 29 percent of worldwide energy consumption and 21 percent of CO₂ emissions among consumers. Businesses should look for innovative solutions that support sustainable pattern of consumption and production.

It is necessary to have a greater awareness of how products and services influence the environmental, environment, and society both in terms of how long they last and how lifestyle choices affect how they are used.

You can see it here. From year 2000 to 2050 it is projected, we are somewhere around in this stage. So resource consumption is going to get like triple, if it is business as usual. If the way it is progressing without sustainable development like practices is going to triple that is the projection.

(Refer Slide Time: 2:42)

■ The utility of circular economy methods

Many of the circular business activities specified in SDG 12 are very important, including water management, waste management, sustainable goods and services, sustainable supply chains, and renewable energy synergies. The industrial contamination of land and water can be reduced by using circular economy techniques.

UN SDGs - Module 6

37

Dr. Shiva Ji
IIT Hyderabad, India

Many of the circular business activities specified in SDG 12 are very important including water management, waste management, sustainable goods and services, sustainable supply chains and renewable energy and synergies. The industrial contamination of land and water can be reduced by using circular economy techniques.

(Refer Slide Time: 2:58)

■ The utility of circular economy methods

To solve this particular issue, it is crucial to follow the circular Rs of rethinking, reducing, re designing, reusing, repairing, refurbishing, remanufacturing, recycling, and repurposing. Sustainable development depends on separating the use of natural resources from economic growth.

3Rs, 5Rs, 7Rs, 9Rs
like. —

UN SDGs - Module 6

38

Dr. Shiva Ji
IIT Hyderabad, India

To solve this particular issue, it is crucial to follow the circular like rethinking like Rs. There are several Rs you may know like 3 Rs and there are 5 Rs, 7 Rs, 9 Rs and even 11 Rs, and even more than that.

So those Rs actually if you will see, they help in multiple stages. The first one comes from like rethinking or reviewing when we make our decisions and that, after that reducing,

redesigning, reusing, repairing, refurbishing, remanufacturing and recycling, repurposing, etcetera, etcetera. Sustainable development depends on separating the use of natural resources from economic growth.

(Refer Slide Time: 3:42)

■ The utility of circular economy methods

The entire quantity of natural resources consumed in economic activities, or domestic material consumption, grew from 1.2 kg to 1.3 kg per unit of GDP between 2000 and 2010, according to global statistics. In the same time frame, total domestic material consumption increased from 48.7 billion tonnes to 71.0 billion tonnes. Natural resource consumption is on the rise globally, notably in eastern Asia, which contributes to the growth.

The entire quantity of natural resources consumed in economic activities, or domestic material consumption grew from 1.2 kg to 1.3 kg per unit of GDP between the year 2000 and 2010. According to global statistics in the same timeframe total domestic material consumption increase from 48.7 billion tonnes to 78, 71 billion tonnes. Natural resource consumption is on the rise globally, notably in eastern Asia, which contributes to the growth.

(Refer Slide Time: 4:11)

■ SDG 15

On the earth, trees cover close to 31% of the land. The livelihood of almost 1.6 billion people depends on trees. The deterioration of the land directly affects over 75% of the world's poor.

More than 80% of all terrestrial species of animals, plants, and insects reside in forests. However, more quickly than at any previous moment in human history, biodiversity is disappearing.

Coming down to SDG 15. So we have 10 million hectares of forests are destroyed every year. Almost 90 percent of global deforestation is due to agricultural expansion. Well, agricultural lands are needed but they are happening at the cost of like you are taking away the forests, and even residential industrial growth and expansions of the cities and towns and villages is also happening at the cost of a loss of the forests.

So livestock grazing cropland expansion, if you see 49.6 percent. Livestock grazing 38.5 percent, and then 133 parties have ratified the Nagoya protocol which addresses access to genetic resources and their fair and equitable use.

Biodiversity is live largely neglected in COVID-19 recovery spending. Around 40,000 species are documented to be at risk of extinction. 40,000 species. Not 1, 2 or 10 or 100. 40,000 to be at risk of extinction over the coming decades. So and there may be even more but at least this much are documented and on the record that these many species are on the brink of extinction.

On the earth, trees cover close to 31 percent of the land. The livelihood of almost 1.6 billion people depends on trees. The deterioration of land directly affects over 75 percent of the world's poor.

More than 80 percent of all terrestrial species of animals, plants, and insects reside in forests. So you can just imagine the loss of habitat which will happen for the majority of the species, 80 percent of all terrestrial species.

However, more quickly than at any previous moment in human history, biodiversity is disappearing. This is the most hazardous, most actually crucial kind of like a change.

(Refer Slide Time: 6:16)

■ SDG 15

Between 2000 and 2015, the terrestrial surface of the planet is thought to have deteriorated by 20%.

As they can provide advantages that will strengthen human resilience to the effects of climate change, biodiversity and the ecosystem services that it supports can also serve as the foundation for policies for disaster risk reduction and climate change adaptation.

UN SDGs - Module 6

41

Dr. Shiva Ji
IIT Hyderabad, India

NPTEL

Between 2000 and 2015, the terrestrial surface of the planet is thought to have deteriorated by 20 percent. So again, there is another cause like deterioration of like the terrestrial surface, this land surface what we have. So that is getting like deteriorated degraded.

As they can provide advantages that will strengthen human resilience to the effects of climate change, biodiversity and the ecosystem services that it supports can also serve as the foundation for policies for disaster risk reduction and climate change adaptation.

(Refer Slide Time: 6:54)

■ SDG 15

Habitat loss for all species, a decline in freshwater quality, an uptick in soil erosion, land degradation, and increased carbon dioxide emissions are all consequences of deforestation and forest degradation.

In other words, ignoring trees has an impact on the health of the world and our communities.

UN SDGs - Module 6

42

Dr. Shiva Ji
IIT Hyderabad, India

NPTEL

Habitat loss for all species, a decline in freshwater quality, an uptick in soil region, land degradation, and increased carbon dioxide emissions are all consequences of deforestation

and forest degradation. In other words, ignoring trees has an impact on the health of the world and our communities.

(Refer Slide Time: 7:11)

■ The utility of circular economy methods

For the challenges mentioned in SDG 15, organic agriculture and organic waste management (fertilisers, soil restoration, and biochar) are beneficial. This is similar to circular farming. In order to benefit both forestry and biodiversity, regenerative agro-forestry techniques, multispecies plantings, and industrial symbiosis in forestry can increase resilience. Sustainable forest management also requires cyclical water management techniques in dry areas, such as fog harvesting.

UN SDGs - Module 6

43

Dr. Shiva B
IIT Hyderabad, India

For the challenges mentioned in SDG 15, organic agriculture and organic waste management fertilizers, soil restoration, and biochar are beneficial. This is similar to circular farming. In order to benefit both forestry and biodiversity, regenerative agro-forestry techniques, multispecies planting so that not just one preferred cash crop is planted all the time but multispecies like the plantations, and industrial symbiosis in forestry can increase resilience. Sustainable forest management also requires cyclical water management techniques in dry areas, such as fog harvesting.

So this is also one of the like a techniques. If you go to the cold desert such as like Ladakh region of India, so there like getting like water is a challenge. So some local techniques have been adopted over here to catch like this fog the tiny like water droplets which are suspended in the air and harvest them for water collection.

(Refer Slide Time: 8:13)

SDG 17
STRENGTHEN THE MEANS OF IMPLEMENTATION AND REVITALIZE THE GLOBAL PARTNERSHIP FOR SUSTAINABLE DEVELOPMENT

REMITTANCES
WILL BE THE LARGEST SOURCE OF EXTERNAL FINANCING IN LOW AND MIDDLE-INCOME COUNTRIES IN 2028 (PROJECTED FOR 2018 \$200 BILLION)

NET ODA TOTALLED \$149 BILLION IN 2018. DOWN BY 2.7% FROM 2017.

IN 2018, BILATERAL ODA TO THE LDCs FELL BY 3% (IN REAL TERMS FROM 2017).

ADD TO AFRICA FELL BY 4%.

CURRENT COMMITMENTS TO STATISTICS—0.33% OF TOTAL ODA—MUST BE DOUBLED TO MEET STATISTICAL CAPACITY-BUILDING OBJECTIVES BY 2030.

IN SUB-SAHARAN AFRICA, LESS THAN ONE-QUARTER OF NATIONAL STATISTICAL PLANS ARE FULLY FUNDED.

UN SDGs - Module 6

44

Dr. Shiva Ji
IIT Hyderabad, India

Coming down to SDG 17, so there are some numbers, NET ODA, total 149 billion dollars in 2018 down by 2.7 percent from 2017. So that is a relation you can see. In 2018, bilateral ODA to the LDCs fell by 3 percent in real terms from 2017. Aid to Africa fell by 4 percent. So remittance is like a usually like is migrated population actually sends some money back that is remittance will be the largest source of external financing in low and middle-income countries from here actually, a huge migration actually takes place. Temporary or permanent also but mostly like a floating population which goes to other places and they send back like the earnings to their homes.

Current commitment to statistics 0.33 percent of total ODA must be doubled to meet the statistical capacity-building objectives by 2030 in Sub-Saharan Africa less than one-quarter of national statistical plans are fully funded.

Over 80 percent of people in developed countries are online by internet connections compared to 45 percent in developing countries and only 20 percent in low developing countries.

(Refer Slide Time: 9:42)

SDG 17

In addition, developed countries will need to fulfil their official development assistance commitments. Multi-stakeholder partnerships will be crucial to leverage the inter-linkages between the Sustainable Development Goals to enhance their effectiveness and impact as well as to accelerate progress in achieving the goals.

UN SDGs - Module 6

45

Dr. Shiva Ji
IIT Hyderabad, India

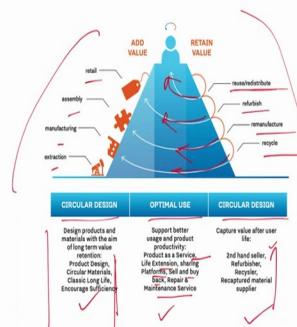

In addition, developed countries will need to fulfil their official development assistance commitments. Multi-stakeholder partnerships will be crucial to leverage the inter-linkages between the sustainable development. Goals to enhance their effectiveness and impact as well as to accelerate progress in achieving the goals.

(Refer Slide Time: 9:58)

The utility of circular economy methods

·Collaboration is required for the transition to the circular economy, which calls for systemic transformation. A municipal government can establish the goal (urgency), specify the parameters, and support experimentation.

UN SDGs - Module 6

46

Dr. Shiva Ji
IIT Hyderabad, India

You can see this figure over here. Collaboration is required for the transition to the circular economy which calls for systematic transformation. A municipal government can establish the goal and specify the parameters, and support experimentation.

So you can see in this one circular design points, optimal uses, and circular line points further and then we have like added values system on this side and retain values on the sides. We

have like retail, assembly, manufacturing, extraction, and the values like reusing, redistributing, refurbishing, remanufacturing, recycling are kind of employed over here bringing out a change.

So design products and materials with the aim of long-term value retention. For example, circular materials, etcetera. That is why I mentioned earlier designing investing more into design is very crucial for improving things.

Optimal use support better uses and product and productivity. Product as a service. We discuss life extension, sharing platforms, sell and buyback those thrift stores, repairs and maintenance services in our relationship.

Capture value after user life. Second-hand seller, refurbishes, recycler, recaptured material supplier, etcetera. So those should become part of the mainstream like a system.

(Refer Slide Time: 11:17)

■ The utility of circular economy methods

Researchers and knowledge organisations may create fresh perspectives and resources, substantiate theories, and increase awareness. Local business owners have the courage and creativity to take chances, drive change, and achieve growth. Educating the future leaders, workers, and customers is equally as important as ensuring meaningful engagement from people and locals.

Researchers and knowledge organizations may create fresh perspectives and resources, substantiate theories and increase awareness. Local business owners have the courage and creativity to take chances, drive change and achieve growth. Educating the future leaders, workers, and customers is equally as important than ensuring meaningful engagement from people to locals.

(Refer Slide Time: 11:42)

■ The utility of circular economy methods

The concept of the value hill illustrates how the circular Rs of rethinking, reducing, redesigning, reusing, repairing, refurbishing, remanufacturing, recycling, and repurposing require businesses to establish new loops in their value chain or ecosystem far beyond the conventional client-supplier relationship. A mutually symbiotic reliance is created by the idea of industrial symbiosis, in which one company's trash is another's resource.

UN SDGs - Module 6

Dr. Shiva Ji
IIT Hyderabad, India

The concept of value hill illustrates how the circular like Rs of rethinking, reducing, redesigning, reusing, repairing, refurbishing, remanufacturing, recycling and repurposing, etcetera like all of those Rs require businesses to establish new loops in the value chain.

Like we saw like in the previous like in here, if you see this is a like a value addition which is happening through these Rs. And again, it can lead to like improvements at each of these stages and optimize the whole like a chain, value chain.

A mutually symbiotic reliance is created by the idea of industrial symbiosis, in which one company's trash is another resource. As I said earlier someone seemed like a waste which is getting exiting in like that cycle can become like the ingredient or like a nutrient for the next cycle. So from one loop it can enter to the another loop and so on. So multiple ways, this cycle of sustainability can take place.

(Refer Slide Time: 12:53)

So now in this one, we will see the topic of design for sustainability where sustainability I think by the time you know what is sustainability and designing for it, designing for sustainability that is design for sustainability, DfS we will see in detail.

(Refer Slide Time: 13:14)

■ Design for sustainability

Design for sustainability (DfS) is an all-encompassing design methodology that places an emphasis on activities' positive effects on both people and the environment. It emphasises the use of environmentally friendly materials and resource efficiency in the development of goods and procedures.

Vezzoli, Carlo, and Ezio Manzini. Design for environmental sustainability. London: Springer, 2008.

Well, DfS is an all-encompassing design methodology. We have been listening the more focus, more aim more attention, is needed at the design stage because if this is improved and all of the rest of the cycles and the stages are going to get improved.

So this is established like, the emphasis and the consideration at the drawing board stage is essential and crucial for the success of overall like this value chain.

So, it says this is an such a like an all-encompassing design methodology that places an emphasis on activities, positive effects on both people and the environment. So keeping those considerations in mind and then you go to the drawing board and design the product. So it emphasises the use of environmentally friendly materials and resources efficiency in the development of goods and processes.

(Refer Slide Time: 14:08)

■ Design for sustainability

The DfS technique is sometimes referred to as a lifecycle design approach since it takes into account details regarding the phases of a product's whole lifespan and how they affect the environment and living things. Currently, the DfS technique is being used more often, particularly for the creation of new products and processes, as a result of consumer and industry efforts to become more sustainable.

Vezzoli, Carlo, and Ezio Manzini. Design for environmental sustainability. London: Springer, 2008.

UN SDGs - Module 6

51

Dr. Shiva Ji
IIT Hyderabad, India

LCA ✓ DfS

The DfS technique is sometimes referred to as a lifecycle design approach since it takes into account details regarding the phases of a product's whole lifespan. So LCA approach also gets utilized in DfS assignments.

Currently, the DfS techniques is being used more often, particularly for the creation of new products and processes, as a result of consumer and industry efforts to become more sustainable.

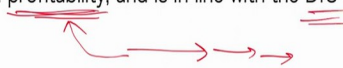

(Refer Slide Time: 14:33)

■ Design for sustainability

ESE

Product innovation is one of the areas where the strategy is frequently used. Current new product innovation focuses on the consequences on people and the environment as well as profitability, in contrast to old product innovation methods that only focused on profitability, and is in line with the DfS objectives.

Vezzoli, Carlo, and Ezio Manzoni. Design for environmental sustainability. London: Springer, 2008.

UN SDGs - Module 6

52

Dr. Shiva Ji
IIT Hyderabad, India

Product innovation is one of the areas where the strategy is frequently used. Current new product innovation focuses on the consequences on people and the environment as well as profitability, so all 3. In contrast to the old product innovation methods that only focused on profitability. So in the conventional linear design process, it used to be the focus of only economic gain but with this, the focus has changed.

(Refer Slide Time: 15:05)

■ Design for sustainability

The DfS of goods and processes includes the use of eco-friendly or green materials as one of its methods. By allowing products to be recycled, reused, and organically biodegradable at the end of their useful lives, the use of green materials in product creation lessens the impact on the environment.

UN SDGs - Module 6

53

Dr. Shiva Ji
IIT Hyderabad, India

The DfS of foods and processes includes the use of eco-friendly or green materials as one of its methods. By allowing products to be recycled, reused, or organically biodegradable at the end of their useful lives. Organically biodegradable, maybe you would like to search more on

this. The use of green materials in product creation lessens the impact on the environment of course.

(Refer Slide Time: 15:27)

■ Design for sustainability

In addition, green materials are frequently made from plants, which have the benefit of endless resources and renewability in contrast to traditional engineering materials like minerals, which have limited and nonrenewable resources. When these attributes of green materials are used in goods and processes, the consequences of high energy consumption and a large carbon footprint are considerably diminished over the course of the full product lifespan.

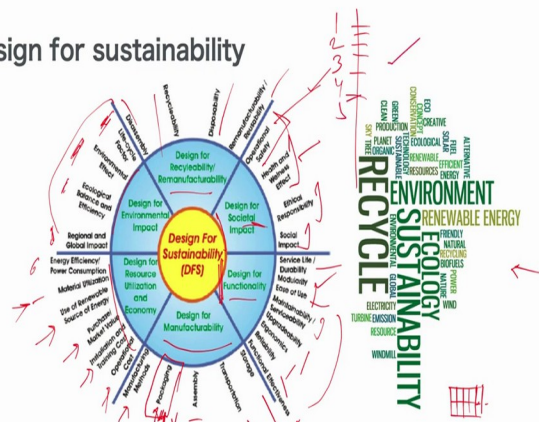

In addition, green materials are frequently made from plants which have the benefit of endless resources and renewability in contrast to traditional materials like minerals because now it is once it is like a manufactured again it is very difficult to like bring it back to the original like a state of like material, which are limited and non-renewable resources.

When these attributes of green materials are used in goods and processes, the consequences are high energy consumption and a large carbon footprint are considerably diminished over the course of the full product lifespan.

(Refer Slide Time: 15:58)

■ Design for sustainability

Jawahir IS, Rouch KE, Dillon OW, Holloway Jr L, Hill A. Design for sustainability (DFS): new challenges in developing and implementing a curriculum for next generation design and manufacturing eng

You can see in this illustration the different aspects, different keywords associated with this. So there is this word cloud from this source. So design for environmental impact, lifecycle factor, you need to consider, environmental effect, ecological balance and efficiency, regional and global impact. Overall, in the design for recyclability, remanufacturing you need to consider for disassembly, recyclability, disposability, manufacturability, reusability etcetera.

Then for societal impacts like social dimensions, operational safety, like how safe it is to operate like machines and tools. Sometimes they end up hurting the operators. Health and wellness effects like ergonomics is one of sciences where we study about like impacts of like a such a thing on the human body like physical or even mental also.

And there are even some wellness effects also like VOCs and things we discussed or if something has a physical as well as psychological impact that needs to be revised and reconfigured to have like a minimal impact. Ethical responsibility, social impacts.

Then for functionality, functional improvements, service life, durability, modular, ease of use, maintainability. You may be aware like this modularity is one of the new qualities where you can bring in like multiple of the same like an object in multiple numbers and configure your stuff.

So in all the sizes and fittings and all of those details are similar and universal. So it is easier for you to modulate in multiple like a numbers and quantities. So easily you can make use of this thing. Upgradability, ergonomics, reliability, functional effectiveness. So they all come under here.

Then for manufacturability, manufacturing methods, the less impacting methods, packaging solutions because one of the most waste producing element from like a manufacturing industry is the packaging. So an extra focus is needed on this one. Assembly, transportation, storage.

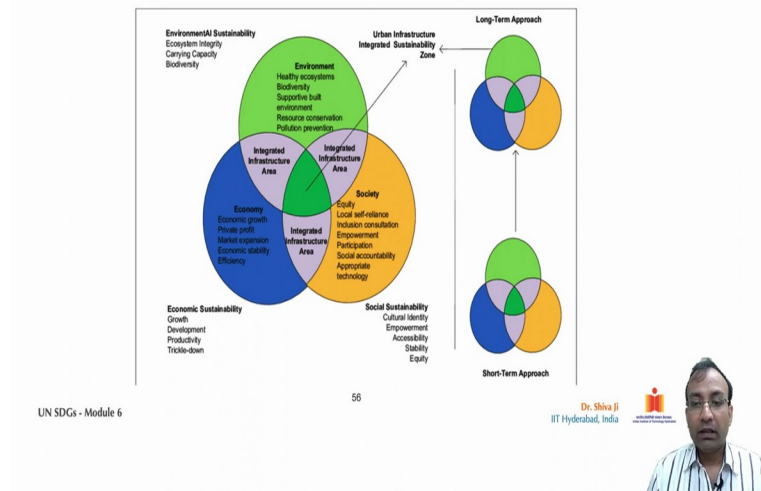

And then design for resource utilization and economy, energy efficient like systems, material utilization maximum like utilization and optimization, use of renewable sources of energy, purchasing like a market value, installation, and training costs, operational costs, etcetera.

So if you see this DfS actually encompasses like a variety of strategies inside this. And they are all essential. It depends on how, what to choose and how to choose etcetera, that depends on your context. What you are designing? In what kind of context and scenarios? So based on

that, you can take a call and you can make a prioritization of these strategies and then you can take up your designing project.

(Refer Slide Time: 19:11)

■ Design for sustainability : Framework

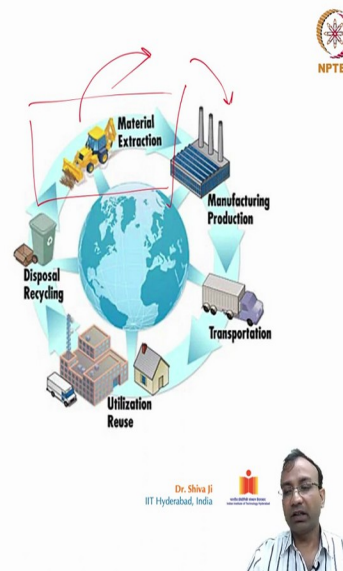

So, ESE aspects and their overlaps. So from short-term approaches to the long-term approaches at major level like city level, urban planning level, and all of that, the impacts are there.

(Refer Slide Time: 19:29)

■ Life Cycle Assessment

The extraction of raw materials is the first step in a product's life cycle. Next comes the creation of the required semi-finished goods, followed by the finishing and assembly of the final product, its usage, and maintenance. Finally, end-of-life activities are performed. This final step comprises final garbage disposal following proper treatment and material recycling.

The extraction of raw materials. On the LCA on the side if you see, so this is the stage which talks about material extraction. So this is the first step in the product's lifecycle. From there you get your resources like your ingredients and then you go for like a second stage.

Semi-finished goods, and then followed by finishing and assembly of the final product, its usage, maintenance and finally, end-of-life activities. This final step comprises final garbage disposal, following proper treatment, and material recycling at the end of it. It comes to the end.

(Refer Slide Time: 20:02)

■ Life Cycle Assessment

In order to identify the best overall solutions, life cycle thinking is a method for addressing and analysing all of these activities in terms of risks, possibilities, and value generation. Internal decision-makers from R&D, manufacturing, marketing, or management are involved, as well as external stakeholders including suppliers, retailers, customers, consumers, and members of the general public.

UN SDGs - Module 6

58

Dr. Shiva Ji
IIT Hyderabad, India

So, LCM, in order to identify the best overall solutions, lifecycle thinking is a method for addressing and analysing all of these activities in terms of risks, possibilities, and value generation.

Internal decision-makers from R and D, or designers who are sitting on the table, engineers it is helpful for them. Even manufacturing units and what materials and combinations they are going to use, marketing people, management are all involved in such exercises as well as external stakeholders including suppliers, retailers, customers, consumers, and members of the general public.

(Refer Slide Time: 20:37)

■ Life Cycle Assessment

In order to identify the best overall solutions, life cycle thinking is a method for addressing and analysing all of these activities in terms of risks, possibilities, and value generation. Internal decision-makers from R&D, manufacturing, marketing, or management are involved, as well as external stakeholders including suppliers, retailers, customers, consumers, and members of the general public.

UN SDGs - Module 6

58

Dr. Shiva Ji
IIT Hyderabad, India

So analysis steps are calculating the overall energy and material inputs, environmental outputs, addressing any potential effects on the environment, and analysing the outcomes throughout the life of the product and even at the end of it.

(Refer Slide Time: 20:52)

■ Life Cycle Assessment

When attempting to control greenhouse gases (GHGs), which are caused by the amount and source of the energy utilised, a life cycle assessment is performed. The total greenhouse gas emissions from all "life" stages of a process, product, or service may be added up using this sort of analysis.

UN SDGs - Module 6

60

Dr. Shiva Ji
IIT Hyderabad, India

When attempting to control greenhouse gases GHGs, which are caused by the amount and source of the energy utilized a lifecycle assessment is performed. The total greenhouse gas emissions from all "life" stages of a process, product, or service will be added up using this sort of analysis.

(Refer Slide Time: 21:09)

■ Life Cycle Assessment

It is simpler to identify where changes may be done to minimise emissions in regions that will significantly change when each step is examined separately. For instance, when a car is driven and fuel is consumed, greenhouse gases are emitted; but, they are also released during the extraction of the oil to make the gasoline and during the transportation of the oil.

UN SDGs - Module 6

61

Dr. Shikha J
IIT Hyderabad, India

So that is where LCA is an important tool. It is simpler to identify where changes may be done to minimize emissions. Because if at different stages where to make, where has the largest impact, you can definitely pin pointedly like work on this and improve this whole value chain.

For instance, when a car is driven and fuel is consumed, greenhouse gases are emitted, but they are also released during the extraction of oil to make the gasoline and during the transportation of the oil. So you can calculate which one has how much potential and how much of correction you can do.

(Refer Slide Time: 21:41)

■ Life Cycle Assessment

A life cycle assessment may also be honed to evaluate alternatives for certain environmental concerns. This can entail limiting development on environmentally valuable area or lowering greenhouse gas emissions. Focusing on a single pollutant or waste is generally easier to control than trying to keep track of all wastes and environmental effects.

UN SDGs - Module 6

62

Dr. Shikha J
IIT Hyderabad, India

So LCA may also be honed to evaluate alternatives of like certain environmental concerns. This can entail limiting development on environmentally valuable areas or lowering greenhouse gas emissions. Focusing on a single pollutant or waste is generally easier to control than trying to keep track of all waste environmental effects.

So maybe you can go in one by one. That is what it is suggesting. Because if you are able to address one properly, definitely it is going to improve the whole like the system and then gradually all of them improved, gradually the whole system will get improved.

(Refer Slide Time: 22:17)

■ Life Cycle Assessment

A life cycle analysis can be advantageous both economically and ecologically. It accomplishes this by examining several choices to enhance various phases of a product's life cycle. Options that first appeared to be pricey may end up being less expensive when expenditures for the complete life cycle are taken into consideration.

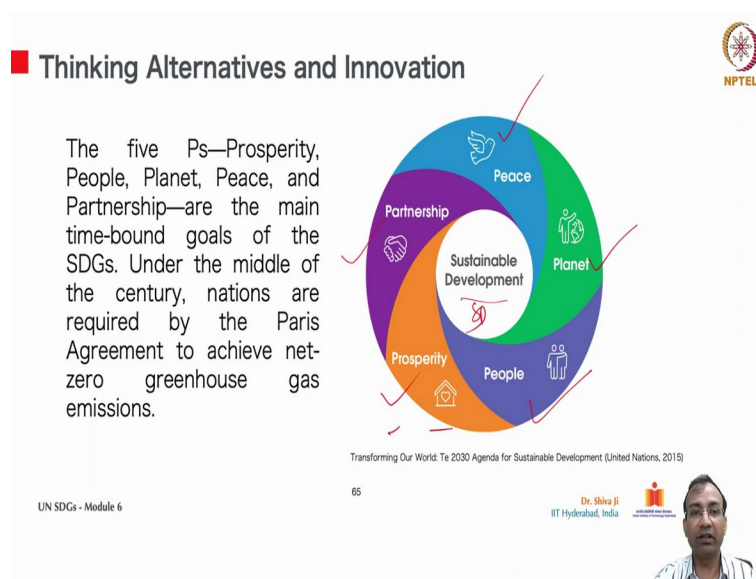

LCA can be advantageous both economically and ecologically. It accomplishes this by examining several choices to enhance various phases of a product's lifecycle. Options that first appear to be pricey may end up being less expensive than expenditures for the complete LCA.

(Refer Slide Time: 22:33)

Slide 64 features a dark grey background with the title "Thinking Alternatives and Innovation" in white text. The NPTEL logo is in the top right corner. At the bottom, it includes the text "UN SDGs - Module 6", the number "64", and "Dr. Shiva Ji" with a small icon. A video feed of Dr. Shiva Ji is visible in the bottom right corner.

Slide 65 has a white background with the title "Thinking Alternatives and Innovation" in black text. The NPTEL logo is in the top right corner. The main content includes a text block on the left and a circular diagram on the right. The text block reads: "The five Ps—Prosperity, People, Planet, Peace, and Partnership—are the main time-bound goals of the SDGs. Under the middle of the century, nations are required by the Paris Agreement to achieve net-zero greenhouse gas emissions." The circular diagram, titled "Sustainable Development", is divided into five colored segments: Peace (blue), Planet (green), People (purple), Prosperity (orange), and Partnership (red). Each segment contains a small icon. Red checkmarks are placed over each segment. Below the diagram is the citation "Transforming Our World: The 2030 Agenda for Sustainable Development (United Nations, 2015)". At the bottom, it includes "UN SDGs - Module 6", the number "65", and "Dr. Shiva Ji" with a small icon. A video feed of Dr. Shiva Ji is visible in the bottom right corner.

So now we are entering to the third topic, Thinking Alternatives and Innovation. So we will see the sustainable development practices what they propagate. It begins with the people, people-centric approach, then considerations about the planet of course, overall peace and prosperity, partnerships, collaborations and prosperity overall. So this together forms a SDG, the 5 Ps they are listed over here.

(Refer Slide Time: 23:05)

■ Thinking Alternatives and Innovation

The Paris Agreement's SDG 13 on climate change refers to the UN Framework Convention on Climate Change, saying that it "is the principal international, intergovernmental platform for negotiating the global response to climate change."

Transforming Our World: The 2030 Agenda for Sustainable Development (United Nations, 2015)

UN SDGs - Module 6

66

Dr. Shiva Ji
IIT Hyderabad, India

So around this like, how things can be developed. So this being as like a conceptual framework. Paris agreement's SDG 13 on climate change refers to the UN Framework Convention on Climate Change, saying that it "is the principle international, intergovernmental platform for negotiating the global response to climate change."

(Refer Slide Time: 23:24)

■ Thinking Alternatives and Innovation

However, fulfilling the SDGs would need significant, structural changes in many facets of society. Evidence shows that international development objectives, such as those centred on public health, can speed progress towards complicated development goals. This brings up the crucial issue of how to structure plans to attain the 17 SDGs.

UN SDGs - Module 6

67

Dr. Shiva Ji
IIT Hyderabad, India

However, fulfilling the SDGs would need significant structural changes in many facets of society. Evidence shows that international development objectives, such as those centred on public health, can speed progress towards complicated development goals. This brings up the crucial issue of how to structure plans to attain the 17 SDGs.

(Refer Slide Time: 23:40)

■ Thinking Alternatives and Innovation

Many writers have demonstrated the interdependence and intricate connection of human, technological, and natural systems that characterise SDG outcomes, including the goals of the Paris Agreement. However, the current research do not specifically highlight how the SDGs should be implemented.

UN SDGs - Module 6

68

So like in implementation, there are challenges and other conditions. So where to kind of intervene that also may depend upon every country to country. Like inside country also, state to state. So considering those points and bringing them for like alternative thinking and innovative ways in which those can be taken out.

Many writers have demonstrated the interdependence and intricate connection of human, technological, and natural systems like connect those 3 things and including the goals of the Paris Agreement. However, the current research do not specifically highlight how the SDGs should be implemented.

So this implementation actually is left on countries to devise their own way. So you may be aware in India it is like NITI AAYOGEC. It is this rural agency at Indian level, at Indian country level which actually plans for the implementations, and then it delegates those like implemented techniques and tools to the states, and then at a state level also things happen; at the district level and then again the lowest administrative level.

And then again, gradually it gives its feedback like a loop to the above and then if there is any other improvement or correction, then again it percolates down from top to bottom, then bottom to up.

(Refer Slide Time: 25:09)

■ Thinking Alternatives and Innovation

We present a comprehensive policy strategy to accomplish each SDG in order to bridge these gaps. Similar to the far more straightforward Millennium Development Targets, a number of policy initiatives are required to accomplish each SDG, and each intervention often advances many goals. To plan and carry out important initiatives, governments must have a strategy.

UN SDGs - Module 6

69

Dr. Shiva Ji
IIT Hyderabad, India

So comprehensive policy strategy is needed to accomplish each SDG in order to bridge those gaps. Because those gaps are like a local gaps, they are not; we cannot generalize or universalize these details. Similar to the far more straightforward Millennium Development Targets, a number of policy initiatives are required to accomplish these SDG, and so for the...

(Refer Slide Time: 25:38)

■ Thinking Alternatives and Innovation

A semi-modular action agenda that may be created by separate, yet interdependent, governmental components can be used to arrange SDG interventions based on The World in 2050's key six Transformations. Each Transformation involves a unique group of business and civil society, permitting focused problem-solving, transparent communication, and the mobilisation of stakeholders.

UN SDGs - Module 6

70

Dr. Shiva Ji
IIT Hyderabad, India

So these are the challenges which you may face if you are kind of a part of an organization which is working for the implementation of SDGs. You may be, you are well aware of these. Maybe in one of your assignments or the final project, you share, like those and look for the local solutions in what ways like you may deal or have already dealt with in the past. So maybe you can talk about your solutions given.

So semi-modular action agenda that may be created by separate, yet interdependent, government components can use to arrange SDG interventions for problem-solving transparent communication and mobilization of stakeholders. We have studied before.

(Refer Slide Time: 26:20)

Thinking Alternatives and Innovation

Table 1 (How SDG Transformations contribute to the achievement of the SDGs)

Transformation	Target for which the transformation is intended	SDG Interventions	Interventions	Materiality with specific SDGs
Sustainable and resilient food and agriculture	Target 2.1: End hunger and achieve food security, improved nutrition and promote sustainable food systems	<ul style="list-style-type: none"> Climate-resilient and sustainable agriculture, aquaculture and fisheries Water and soil management Food safety and food quality Food systems 	<ul style="list-style-type: none"> Climate-resilient and sustainable agriculture, aquaculture and fisheries Water and soil management Food safety and food quality Food systems 	2, 12, 13, 14, 15, 16, 17, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
			<ul style="list-style-type: none"> Climate-resilient and sustainable agriculture, aquaculture and fisheries Water and soil management Food safety and food quality Food systems 	2, 12, 13, 14, 15, 16, 17, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
Sustainable and resilient energy	Target 7: Affordable and clean energy	<ul style="list-style-type: none"> Energy efficiency Renewable energy Energy infrastructure Energy services 	<ul style="list-style-type: none"> Energy efficiency Renewable energy Energy infrastructure Energy services 	7, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
			<ul style="list-style-type: none"> Energy efficiency Renewable energy Energy infrastructure Energy services 	7, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
Sustainable and resilient industry, innovation and infrastructure	Target 9: Industry, innovation and infrastructure	<ul style="list-style-type: none"> Infrastructure Industry Innovation Infrastructure 	<ul style="list-style-type: none"> Infrastructure Industry Innovation Infrastructure 	9, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
			<ul style="list-style-type: none"> Infrastructure Industry Innovation Infrastructure 	9, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
Sustainable and resilient cities and communities	Target 11: Sustainable cities and communities	<ul style="list-style-type: none"> Urban and infrastructure Urban and infrastructure Urban and infrastructure Urban and infrastructure 	<ul style="list-style-type: none"> Urban and infrastructure Urban and infrastructure Urban and infrastructure Urban and infrastructure 	11, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
			<ul style="list-style-type: none"> Urban and infrastructure Urban and infrastructure Urban and infrastructure Urban and infrastructure 	11, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
Sustainable and resilient ecosystems	Target 15: Life on land	<ul style="list-style-type: none"> Terrestrial ecosystems Terrestrial ecosystems Terrestrial ecosystems Terrestrial ecosystems 	<ul style="list-style-type: none"> Terrestrial ecosystems Terrestrial ecosystems Terrestrial ecosystems Terrestrial ecosystems 	15, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
			<ul style="list-style-type: none"> Terrestrial ecosystems Terrestrial ecosystems Terrestrial ecosystems Terrestrial ecosystems 	15, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
Sustainable and resilient oceans, seas and marine resources	Target 14: Life below water	<ul style="list-style-type: none"> Marine and coastal ecosystems Marine and coastal ecosystems Marine and coastal ecosystems Marine and coastal ecosystems 	<ul style="list-style-type: none"> Marine and coastal ecosystems Marine and coastal ecosystems Marine and coastal ecosystems Marine and coastal ecosystems 	14, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
			<ul style="list-style-type: none"> Marine and coastal ecosystems Marine and coastal ecosystems Marine and coastal ecosystems Marine and coastal ecosystems 	14, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
Sustainable and resilient peace, justice and strong institutions	Target 16: Peace, justice and strong institutions	<ul style="list-style-type: none"> Peace, justice and strong institutions Peace, justice and strong institutions Peace, justice and strong institutions Peace, justice and strong institutions 	<ul style="list-style-type: none"> Peace, justice and strong institutions Peace, justice and strong institutions Peace, justice and strong institutions Peace, justice and strong institutions 	16, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
			<ul style="list-style-type: none"> Peace, justice and strong institutions Peace, justice and strong institutions Peace, justice and strong institutions Peace, justice and strong institutions 	16, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
Sustainable and resilient partnerships for development	Target 17: Partnerships for development	<ul style="list-style-type: none"> Partnerships for development Partnerships for development Partnerships for development Partnerships for development 	<ul style="list-style-type: none"> Partnerships for development Partnerships for development Partnerships for development Partnerships for development 	17, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
			<ul style="list-style-type: none"> Partnerships for development Partnerships for development Partnerships for development Partnerships for development 	17, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25

Since the three key trade-offs are resolved, Table 1 shows no negative connections between intermediate outputs and SDG outcomes. The first step is to resolve some trade-offs (such as those between agricultural productivity and biodiversity degradation, for example) using systems-based techniques that mix potentially conflicting actions inside a Transformation.

UN SDGs - Module 6

71

Dr. Shiva Ji
IIT Hyderabad, India

Thinking Alternatives and Innovation

Table 1 (How SDG Transformations contribute to the achievement of the SDGs (continued))

Transformation	Target for which the transformation is intended	SDG Interventions	Interventions	Materiality with specific SDGs
Sustainable and resilient digital and information infrastructure	Target 9.4: Upgrade infrastructure and expand the quality, reliability, resiliency, affordability, inclusivity and sustainability of infrastructure	<ul style="list-style-type: none"> Digital and information infrastructure Digital and information infrastructure Digital and information infrastructure Digital and information infrastructure 	<ul style="list-style-type: none"> Digital and information infrastructure Digital and information infrastructure Digital and information infrastructure Digital and information infrastructure 	9, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25
			<ul style="list-style-type: none"> Digital and information infrastructure Digital and information infrastructure Digital and information infrastructure Digital and information infrastructure 	9, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25

The leave-no-one-behind principle is included into important interventions to ensure that investments in services, infrastructure, and technology advance fairness. Third, within a stable Earth system, the circularity and decoupling principles are used to handle natural resource trade-offs.

UN SDGs - Module 6

72

Dr. Shiva Ji
IIT Hyderabad, India

Since the 3 key trade-offs are resolved. So like we saw those at the cusp of these Eses. It is a trade-off between like these and collectively there is a trade-off and the final things happens over here in the middle, that we call it as SD. So this what these trade-offs can be, you can see here on this table. That is given on the left side.

So for transformation like 1 principal line ministries involved in the transformation like education, science and technology, family and social affairs. So 3 ministries we see over here and then SDG intervention. So what all are possible through these? Like early childhood

development, primary-secondary education, vocational trainings, higher education, social production systems, and labour standards, they all can come and become a group for this thing and intermediate outputs, education and human capital development.

So in relation to the SDGs like, you can see 1 2 3, 1 2 3 it goes like this data is fed over here. similarly, we have like most of the major industrial-like sectors like health, building construction, energy, agriculture, environment, forest health etcetera, then urban transportation and water sanitation etcetera and SMT telecom.

(Refer Slide Time: 27:51)

Thinking Alternatives and Innovation

Leave no one behind

Transformation 6
Digital revolution for sustainable development

Transformation 1
Education, gender and equality

Transformation 2
Health, well-being and demography

Transformation 3
Energy decarbonization and sustainable industry

Transformation 4
Sustainable food, land, water and oceans

Transformation 5
Sustainable cities and communities

Circularity and decoupling

Sachs, J. D., Schmidt-Traub, G., Mazzucato, M., Messner, D., Nakicenovic, N., & Rockström, J. (2019). Six transformations to achieve the sustainable development goals. *Nature sustainability*, 2(9), 805-814.

UN SDGs - Module 6

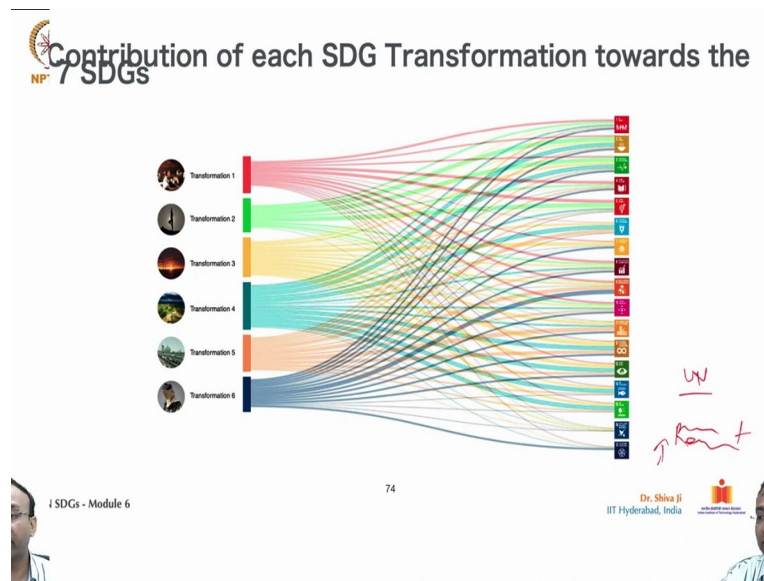

73

Dr. Shiva Ji
IIT Hyderabad, India

NPTEL

So the motto is, leave no one behind. So transformation 1 education, gender and equality and health well-being and demography, energy decarbonization, sustainable industries. Then food, land, water resources like natural domain and then sustainable cities and communities and then finally, overall transformation and social development.

(Refer Slide Time: 28:25)

Relationships you can see over here. Well, this kind of data are all available in majority of the books which I have shared in the description. Maybe you guys can have a look and UN has released several reports and documents. Maybe you can refer them for more detailed data and case studies specific case studies from different countries that will be helpful for your projects.

(Refer Slide Time: 28:52)

■ Transformation 1

The development of human capital via education fosters economic growth, the eradication of severe poverty, adequate employment opportunities, and the eradication of gender and other disparities. Three sets of initiatives are included in the first Transformation to lessen inequality and advance education and gender equality.

Handwritten red notes: 'skills' with an arrow pointing to 'education' and a circular arrow.

The slide includes the NPTEL logo, the text 'UN SDGs - Module 6', the number '75', and the name 'Dr. Shiva Ji IT Hyderabad, India'.

The development of human capital via education fosters economic growth, because once educated you may be possessing certain skills and you may contribute directly to some industry, some sector and like make use of that to earn for yourself and in turn into like a becoming a responsible citizen, and a productive person in the overall system.

The eradication of severe poverty, adequate employment opportunity, and eradication on gender and other disparities. So with the overall education, a purpose is far larger than just scaling and giving you some knowledge and as an overall effort for improvement at the social level, at the human level, 3 sets of initiatives are included in the first Transformation. That we have seen.

(Refer Slide Time: 29:39)

■ Transformation 1

As suggested by the Programme for International Student Assessment of the Organisation for Economic Co-operation and Improvement, it calls for improved teacher preparation, curriculum development, and ongoing assessment of learning outcomes. In spite of the fact that they facilitate the transition from school to the workforce, boost lifetime wages, and lessen inequality, vocational training, school-to-work programmes, and higher education are undeveloped in the majority of nations.

So that is why it was strengthening educational institutions is a must-must for any country's overall growth and development in the future. If you are strong in science and technology, if you are strong in education, if you are strong in research, you will definitely you will have like a advantage to proceed faster and you and longer in terms of like new adoptions and developments.

Even in high-income societies, investments in early childhood development have lagged behind the benefits to children's cognitive and emotional growth that last into adulthood. So these have the potential to like affect till the whole of your life.

The foundation of the educational system is access to high-quality elementary and secondary education. So, beginning from like a level 0 till the top like level primary, secondary, tertiary and all of those and like education levels, one must go for like quality education.

(Refer Slide Time: 30:46)

■ Transformation 1

As suggested by the Programme for International Student Assessment of the Organisation for Economic Co-operation and Improvement, it calls for improved teacher preparation, curriculum development, and ongoing assessment of learning outcomes. In spite of the fact that they facilitate the transition from school to the workforce, boost lifetime wages, and lessen inequality, vocational training, school-to-work programmes, and higher education are undeveloped in the majority of nations.

So several schemes and programs are coming. So in this one, you can see the transformation I suggested by like this thing International Student Assessment of Organisation for Economic Co-operation and Improvement, calls for improved teacher preparation because the teachers are the pillars of education. They are the ones who are empowering more and more like people. So the basic and must investment that should happen at this stage.

Curriculum development like the most efficient and state-of-the-art curriculum. So that the latest piece of information and knowledge can be given. Ongoing assessment of learning outcomes. So it should be in order keep tags on like checks and measure to improve it.

In spite of the fact that they facilitate the transition from school to the workforce, boost lifetime wages and lessen inequality, vocational training, school-to-work programs, and higher education are undeveloped in the majority of the nations and this is why this must be focused.

(Refer Slide Time: 31:50)

■ Transformation 1

These initiatives work together to develop human capital, which specifically aims to advance SDGs 4 (education), 5 (gender equality), and 10 (reduced inequalities).

Second, nations must widen their social safety nets in order to further reduce inequality. Additional steps must be taken to combat prejudice, raise labour standards, and put an end to all types of modern slavery, human trafficking, and child labour.

UN SDGs - Module 6

78

Dr. Shiva Ji
IIT Hyderabad, India

These initiatives work together to develop human capital, which helps directly to many of the SDGs and indirectly also to others.

(Refer Slide Time: 32:01)

■ Transformation 2

Important investments in health and wellbeing are encouraged by this transformation. Health ministries will be in charge of conception and execution, working with other ministries like labour and industry. If the leave-no-one-behind principle is followed, the essential initiatives under Transformation 2 are synergistic without causing any significant trade-offs.

UN SDGs - Module 6

79

Dr. Shiva Ji
IIT Hyderabad, India

■ Transformation 2

Interventions under other Transformations support positive health outcomes and wellbeing, particularly those pertaining to environmental health and healthy behaviours. Universal healthcare is the main intermediate result. It calls for a publicly funded healthcare system that combines surveillance and management of diseases with curative, palliative, and preventative services

UN SDGs - Module 6

80

Dr. Shiva Ji
IIT Hyderabad, India

Transformation 2. Important investments in health and well-being because only a healthy person, physically and mentally will be in the right state of mind to contribute whatever he or she is actually working on doing. So it is very essential. Otherwise, the person is going to get like a disease and condition, will become a further burden on the society. So positive health outcomes and well beings.

(Refer Slide Time: 32:31)

■ Transformation 2

In order to effectively prevent and treat infectious illnesses, provide treatments for maternity, neonatal, and child health, and manage non-communicable diseases, such as mental health and basic surgery, health systems must place a strong emphasis on primary healthcare. Investments in children's health and sexual and reproductive health, along with better girls' education and gender equality, will hasten the voluntary shift to low fertility rates.

UN SDGs - Module 6

81

Dr. Shiva Ji
IIT Hyderabad, India

In order to effectively prevent and treat infections, infectious diseases, illnesses provide treatments for maternity, neonatal, child health. So beginning from the initial days of the birth of a child till the elderly age this health security also should be granted as a must and manage non-communicable diseases. So easily in mental health, you can see. Just found, like mentioned here, basic surgery, health systems must place a strong emphasis on primary health care.

(Refer Slide Time: 33:02)

■ Transformation 2

Community health initiatives have a major positive impact on health outcomes.

The social determinants of health can be improved by health initiatives outside the health system. They contain measures and policies that improve wellbeing and quality of life.

UN SDGs - Module 6

82

Dr. Shiva Ji
IIT Hyderabad, India

Because it has major positive impact on the health outcome. So such initiatives must be promoted.

(Refer Slide Time: 33:11)

■ Transformation 2

Through improved cleanliness, reduced intake of cigarettes, alcohol, and other dangerous drugs, and abstinence from risky behaviour (for instance, using safe sex practises to limit the transmission of sexually transmitted illnesses), changes to societal norms and behaviours promote healthy lives. To decrease accidents and transportation fatalities, nations should take into account subjective well-being while developing policies, improving product design, and raising labour standards.

UN SDGs - Module 6

83

Dr. Shiva Ji
IIT Hyderabad, India

Through improved cleanliness. In this first example you may be aware Government of India, some time back took it as a national challenge to clean our vicinity. So that is one of the like most amazing like a national drive in the recent like a decades and there was like a significant improvement. Well, there is a lot more to do but this persistent effort from all the stakeholders is definitely needed to achieve the goal.

Reduced intake of cigarettes, alcohol, and other dangerous drugs, to reduce them and remove them finally. Abstinence from risky behaviour. So like such things cause issues individually. And finally, if an individual is affected and the whole system is getting affected.

(Refer Slide Time: 33:35)

■ Transformation 3

In accordance with the Paris Agreement, this Transformation intends to eliminate industrial pollution of the soil, water, and air, provide universal access to contemporary energy sources, and decarbonize the energy system by the middle of the century. Buildings and construction, energy, the environment, and transportation are just a few of the government ministries that must work closely together to execute this transformation. Although interventions have a synergistic effect, shoddy design may result in tradeoffs.

In accordance with the Paris Agreement, this Transformation, the third one intends to eliminate industrial pollution of the soil, water, and air. So all sorts of pollution and how these can be eliminated completely. Provide universal access to contemporary energy sources, and decarbonized energy systems.

(Refer Slide Time: 34:16)

■ Transformation 3

Assuring access to contemporary energy services entails giving 1.1 billion people access to electricity through grid expansions or microgrids, as well as the 2.8 billion people who do not have access to modern fuels for cooking and heating.

To reduce carbon emissions, energy systems must be decarbonized in three different ways: power production, transmission, buildings, transportation, and industry.

So assuring access to contemporary energy sources entails giving 1.1 billion people access to electricity through grid expansions or microgrids. So instead of having very large

like our industrial or energy generation units we can go for small-small like multiple ones at different places. I think that is one of the like a distributed economic system or like models which helps like a concentrated, even like invested or concentrated conjunction of resources to distributed consumption and investment. So that is the most efficient one. It helps reducing the migration of people and migration of resources also.

(Refer Slide Time: 35:02)

■ Transformation 3

The first deals with the transition from fossil fuels to zero-carbon energy sources, such as wind, solar, hydro, geothermal, and tidal energy, among others, in order to decarbonize the production of electricity. Some nations may also contemplate increasing their nuclear power capacity or sticking with fossil fuels while capturing and storing carbon. Power grid efficiency may be improved by addressing intermittency, reducing the demand for electricity storage, and using long-distance power transmission.

So transition from fossil fuels of course to the like a carbon neutral like energy sources like natural sources we know like wind, solar, hydro, geothermal, etcetera which have like a low impact. Well, energy storage being still one of the polluting ones but I am sure in the recent in a few years we will have like much greener solutions of those types also.

(Refer Slide Time: 35:27)

■ Transformation 3

The first deals with the transition from fossil fuels to zero-carbon energy sources, such as wind, solar, hydro, geothermal, and tidal energy, among others, in order to decarbonize the production of electricity. Some nations may also contemplate increasing their nuclear power capacity or sticking with fossil fuels while capturing and storing carbon. Power grid efficiency may be improved by addressing intermittency, reducing the demand for electricity storage, and using long-distance power transmission.

Must increase the efficiency of their ultimate energy uses which include transportation, building heating, etcetera, cooling in HVAC, industrial energy uses.

(Refer Slide Time: 35:39)

■ Transformation 4

Permanent hunger, malnutrition, and obesity are now caused by land use and food systems. A quarter of greenhouse gas emissions, over 90% of water use that is scarcity-weighted, the majority of biodiversity losses, overfishing, eutrophication from nutrient overload, and pollution of the air and water are all attributed to them. Food systems are also quite susceptible to both land degradation and climate change. To ensure the sustainability and health of food systems, land usage, and seas for human consumption, integrated methods are required

UN SDGs - Module 6

88

Dr. Shiva Ji
IIT Hyderabad, India

Permanent hunger, malnutrition, and all related to that transformation 4, and obesity are now caused by land use and food system. A quarter of greenhouse gas emissions, over 90 percent of water use that is scarcity-weighted. So those also require transformative change.

(Refer Slide Time: 35:56)

■ Transformation 4

With regard to interventions, this Transformation has the greatest potential for trade-offs. The loss of biodiversity and the shortage of water may be made worse by increases in agricultural productivity. Globally increasing wages will put additional pressure on food systems unless diets grow healthier and more ecologically friendly.

UN SDGs - Module 6

89

Dr. Shiva Ji
IIT Hyderabad, India

And with regard to interventions, this Transformation has the greatest potential for trade-offs. The loss of biodiversity and the shortage of water may be made worse by increases in agricultural productivity because it consumes, agriculture consumes a huge amount of water.

(Refer Slide Time: 36:10)

■ Transformation 4

The first intervention area focuses on fisheries and productive, resilient agriculture systems that provide a living. Significant improvements are required in post-harvest losses, yields, and resource use efficiency in terms of nutrients, water, greenhouse gas emissions, and chemicals. In turn, this will need the development of context-specific methods for the production of biofuels, livestock, aquaculture, fisheries, forestry, and key agricultural systems.

UN SDGs - Module 6

90

Dr. Shiva Ji
IIT Hyderabad, India

First intervention area focuses on fisheries and production. So in this one like depending upon the local or regional requirement, one can focus and then this has directly relation to the food systems also.

(Refer Slide Time: 36:27)

■ Transformation 4

Parallel to this, enhanced biodiversity protection in agriculture is required through intercropping, agroforestry, biosphere reserves, and the prudent use of chemicals. For coastal and high seas fisheries, better management techniques are required to reduce overfishing and preserve productivity. Second, it's important to protect and restore ecosystems such as forests, soils, peat bogs, wetlands, savannahs, and coastal marine regions. Conservation strategies must be developed and put into action with the help of neighbourhood communities.

UN SDGs - Module 6

91

Dr. Shiva Ji
IIT Hyderabad, India

Protecting biodiversity, enhancing it with the help of connecting with the agriculture. You may be aware, rice fields in Assam or many other countries also they use natural like elements such as fish and like ducks for like an insect like handling insects.

And their droppings further help like, boosting fertility of the soil. So it is a win-win situation. In both hands, you can see it helps biodiversity. So such local solutions should be devised to help forest, soil, peat bogs, wetlands, savannahs, and other places.

(Refer Slide Time: 37:15)

■ Transformation 5

Approximately 55% of the world's population lives in cities and other metropolitan regions, which are also where 70% of the world's economic activity occurs. These proportions will rise to 70 and 85%, respectively, by 2050. Although most cities are far from achieving the triple goal of being economically productive, socially inclusive, and ecologically sustainable, cities are particularly vulnerable to climate change. Informal settlements are home to around one third of urban residents. Many tiny towns and villages lack access to energy, water, sanitation, and transportation.

57% ↑

UN SDGs - Module 6

92

Dr. Shiva Ji
IIT Hyderabad, India

For 5, for the fifth one, approximately 55 percent of the world's population lives in cities and other metropolitan regions. Well in India also conventionally this percentage is increasing slowly over the last decades. It has increased tremendously and even smaller towns are growing into bigger towns. Bigger towns are growing into cities. Cities are growing into the megapolis and things like that. So this overall percentage of the population living in cities, in urban areas is increasing tremendously. So there is a balance what is needed.

(Refer Slide Time: 37:56)

■ Transformation 5

Assuring access to the water supply, sanitation, and adequate sewage and waste disposal in urban and rural regions is a primary emphasis of this transformation. According to estimates, 2.4 billion people lack access to sanitation facilities, and 1.2 billion people lack access to services for managing drinking water. Investments in water supply and sanitation work in harmony with strategies for reducing water scarcity that balance agricultural water use with sustainable supply. Additionally essential are sustainable waste management techniques and recycling.

UN SDGs - Module 6

93

Dr. Shiva Ji
IIT Hyderabad, India

And that population actually requires like all sorts of facilities and amenities, water supplies, sanitation, and adequate sewage and waste disposal etcetera and along with health, education and livelihood, employment and all of those opportunities.

(Refer Slide Time: 38:11)

■ Transformation 5

Mobility that is efficient and sustainable comes in second. This includes ride-sharing services, public transportation networks, and the infrastructure for roads, railroads, and ports. Infrastructure should be placed in accordance with participative, inclusive urban planning that balances conflicting interests within cities, takes into account predicted population increase, and makes trade-offs between infrastructure services and other policy objectives. Reduced air pollution from transportation must be a top priority, as must long-term transportation sustainability.

UN SDGs - Module 6

94

Dr. Shiva Ji
IIT Hyderabad, India

Mobility, another important factor, transportation, and mobility. Because this also contributes sometimes directly and sometimes indirectly to the SDGs and overall like energy consumptions, overall impact, overall LCA analysis. So how this can be brought into an efficient system?

(Refer Slide Time: 38:35)

■ Transformation 5

Third, in order to accommodate growing urban populations, improve resource use efficiency, and prevent excessive land conversion, cities need to encourage more compact, safe, and healthy settlements. This calls for sufficient green areas, walking and cycling infrastructure, as well as other initiatives that improve resource use efficiency and quality of life.

UN SDGs - Module 6

95

Dr. Shiva Ji
IIT Hyderabad, India

So to improve efficiency, preventing excessive land convergence, cities need to encourage more compact, safe and healthy settlements so that there are sufficient habitable areas.

(Refer Slide Time: 38:53)

■ Transformation 6

AI ML

Nearly every sector of the economy is being affected by artificial intelligence and other digital technologies, sometimes referred to as the Fourth Industrial Revolution, including: agriculture (precision agriculture), mining (autonomous vehicles), manufacturing (robotics), retail (e-commerce), finance (e-payments and trading strategies), media (social networks), health (diagnostics and telemedicine), education (online learning), public administration (e-governance and e-voting).

UN SDGs - Module 6

96

Dr. Shing Ji
IIT Hyderabad, India

Every sector economy is being affected by artificial intelligence. So like using state-of-the-art technologies like AI, machine learning and all, also may like, help you empower you in growing for solving these tough solutions, tough situations, with efficient solutions.

So with the help of like a such like technologies we can even like go for their applications in all of the sectors. No need to take the names, but I think applications are really, really like an immense like potential.

(Refer Slide Time: 39:25)

■ Transformation 6

Digital technologies have the potential to enhance market matching, cut resource-intensive manufacturing costs, minimise emissions, increase productivity, broaden access, enable the use of big data, and increase accessibility to public services. Additionally, they may enhance resource efficiency, encourage the circular economy, enable zero-carbon energy systems, assist in monitoring and safeguarding ecosystems, and perform other vital tasks in support of the SDGs.

UN SDGs - Module 6

97

Dr. Shing Ji
IIT Hyderabad, India

Digital technologies have potential to enhance market matching, cut resource-intensive manufacturing costs, minimize emissions, increase productivity, broaden access, enable the use of big data, increase accessibility to public services.

Additionally, they may enhance resource efficiency, encourage the circular economy, enable the zero-carbon energy systems, assist in monitoring and safeguarding ecosystem, performing other vital tasks also to support often like all of the SDGs combined.

(Refer Slide Time: 40:01)

■ Putting the Six Transformations into Practice

- Design and technology missions with goals ✓
 - Goal-based governance and financial organization ✓
 - Social activism to alter attitudes and conduct ✓
 - International relations and diplomacy for partnership, financing, and peace ✓
 - A plan of action for science ✓
 - Ability to create transformations. ✓
 - Time-based standards. ✓
 - Participant involvement and co-design ✓
 - Policy monitoring, assessment, and tracking ✓
- Frugal design*

UN SDGs - Module 6

98

Dr. Shiva Ji
IIT Hyderabad, India

So putting them all into the practice you can see, design and technology missions with goals; goal-based governance and financial organization; social activism to alter altitude and conduct, attitude and conduct; international relations and diplomacy and offer partnership, financing and peace essential for all of them to work smoothly; plan for action for science; ability be to create transformations; time-based standards; participant involvement and co-design is one of the aspects where the user himself and herself becomes part of the system to design what kind of system they want.

So instead of coming finding solutions from elsewhere and implementing in here, you can involve your own users and communities in devising the solution. This is the most efficient way and one of the design techniques, we call it frugal design, where no participant himself and herself is a part of the design process and that is where you can optimize and improve the efficiency of your design. Lastly, policy monitoring, assessment, and tracking.
