Mod08 Lecture 40
Shortest Path Problems (Contd.)

So in our last class, we were solving shortest path problems. Now we will continue from there. Very quickly in our last lecture, we have seen the Bellmans optimality principle that if we have reached a particular point, no matter how we have reached, the remaining distances should be optimally found, right. So that is the essential idea and based on which we have an algorithm call Dijkstras algorithm.

(Refer Slide Time: 0:51)

Dijkstra's Algorithm

Step 1
Assign label 0 to starting node s and all other nodes a label ∞ . Make s a permanent node. Let $p = s$; p is the last node made permanent.

Step 2
Let d_{pk} be the distance from node p to all other non-permanent nodes k . Recompute l_k , the label of each node k as:
$$l_k = \text{Min}\{l_k, (l_p + d_{pk})\}$$

Step 3
If the ending node t is made permanent, stop. l_t is the shortest path from s to t .
Else go to step 2.

21

Now this is how the official statement of the Dijkstras algorithm, let us note it down. First of all assign a level 0 to the starting node s and all other nodes a level infinity. Make s a permanent node, let p equal to s where p is the last node made permanent that is the step 1. At the step 2, D_{pk} be the distance from node p to all other non-permanent nodes k . Recomputed l_k means the level of all the remaining nodes as minimum of l_k the current level and l_p plus D_{pk} , right. So that is step 2. Step 3, if the ending node t is made permanent then stops. l_t is the shortest path from s to t , is all right, else go to step 2 otherwise keep computing. So idea is that all the nodes should be made permanent when all the nodes are permanent then the Dijkstras algorithm really stops, right.

(Refer Slide Time: 2:06)

Dijkstra's Algorithm

Consider a network with distances:

- s-a : 20; s-b: 55; s-d : 75; a-c : 82; a-d : 92; b-c: 71; b-d: 47; c-t : 35; d-t : 75.
- Find out the **shortest path** between s and t.

```
graph LR; s((s)) ---|20| a((a)); s ---|55| b((b)); s ---|75| d((d)); a ---|82| c((c)); a ---|92| d; b ---|71| c; b ---|47| d; c ---|35| t((t)); d ---|75| t;
```

Now let us look at one more problem. So this is a network then we have these distances s to a and a to c etcetera and you know we have to find let us say, the shortest path between s and t. really you see, like here you are having the network shown, a many a time it is not always the network will be drawn for you, right. Basically all you have is a matrix something like a distance matrix that s, a, b all the nodes on one side and the other nodes on the other side and the distances between them that is the matrix that will be available to you, right. So if we have to follow the Dijkstra's algorithm how do we go about?

(Refer Slide Time: 3:02)

Dijkstra's Algorithm

Distance Matrix	s	a	b	c	d	t
s	-	20	55	-	75	-
a	20	-	-	82	92	-
b	55	-	-	71	47	-
c	-	82	71	-	-	35
d	75	92	47	-	-	75
t	-	-	-	35	75	-

So if you look at it that we create the distance matrix. So here is the distance matrix, this side is the nodes that side is also the nodes and s to a, s to b, s to d and if you see, you know the node s to node a is 20 and node a to node s is also 20, then this particular all the rows, the first row and first column, second row and second column they will be identical, but if the distance s to a or a to s are different then we have different rows and column values. So anyhow this is the distance matrix, we obtain first.

(Refer Slide Time: 3:47)

Dijkstra's Algorithm

Step 0	s	a	b	c	d	t
Temp label l(i)	0	∞	∞	∞	∞	∞
Permanent?	Yes	No	No	No	No	No
Made from	-	-	-	-	-	-

Initially, all the nodes are assigned an ∞ label except the starting node s which is assigned a label of 0.

's' is made a permanent node.

Now after the distance matrix is obtained you see, first we have made s permanent right. s is made permanent and temporary level is assigned to s as 0, then a,b,c,d,t all the remaining nodes they are assigned as infinity as the your temporary level. Now is anything is

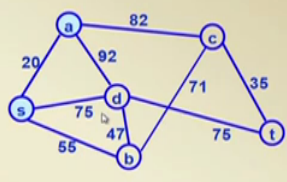

permanent. Now s is made permanent, so this is s and this arrow means that this is the last node that is to have been made permanent and made from I mean nothing, because after all s has to be made from s what we need or write it, right. So that is the first step.

Now what we should do? Please think, I have already shown one example, in our last lecture. So how what should you do from s? What are the points you can reach? You can reach a, d and b, there are direct paths where direct path is not there, we consider the distance to be infinity and since, infinity as a level is already there, we need not compute them. So what will be the new level of a? You see, it should be the lower of current level of a, which is infinity then 0 plus, because level of s is 0 last node to have made permanent plus the distance. So 0 plus 20 is 20, so 20 is lower of 20 and infinity. So level of a should be now 20 instead of infinity. How much should be b, b should be then 55 and d should be 75.

(Refer Slide Time: 5:35)

Dijkstra's Algorithm

Step 1	s	a	b	c	d	t
Temp label l(i)	0	20	55	∞	75	∞
Permanent?	Yes	Yes	No	No	No	No
Made from	-	s	s	-	s	-

$l(a) = \text{Min} \{l(a), l(s) + d(s,a)\} = \text{Min} \{\infty, 0+20\} = 20$ **
 $l(b) = \text{Min} \{l(b), l(s) + d(s,b)\} = \text{Min} \{\infty, 0+55\} = 55$
 $l(d) = \text{Min} \{l(d), l(s) + d(s,d)\} = \text{Min} \{\infty, 0+75\} = 75$

** 'a' is now made permanent from node 's'

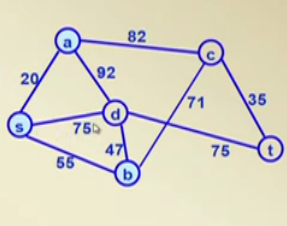

So exactly that is what is done here that 0, 20, 55 and 75. Now which one should be made permanent you have to make out of all the node see, 0 is already taken out, because it is already permanent out of the remaining nodes which one is the minimum? A is the minimum. So then it is you know optimal distance from s to a will be 20 and then we make a as also permanent. So a is made permanent and a is made permanent from whom from s, so that made from s note it also. So s and a are now permanent a is the last node to have made permanent right, a is the now made permanent from node s. So a is the last node to have made permanent.

So now the next distances are to be computed from a. So as you see you can reach 2 nodes c and d. So if you go to c then it should be 20 plus 82, 102, but current value is infinity. So which one is lower 102, so we can have a value of 102 now, but what about d. The d value was 75 and if you go from a to d, a value is 20, so it will become 112. So no point exploring that path 75 should remain.

(Refer Slide Time: 7:08)

Dijkstra's Algorithm

Step 2	s	a	b	c	d	t
Temp label I(i)	0	20	55	102	75	∞
Permanent?	Yes	Yes	Yes	No	No	No
Made from	-	s	s	a	s	-

$I(b) = \min \{I(b), I(a) + d(a,b)\} = \min \{55, 20 + \infty\} = 55^{**}$
 $I(c) = \min \{I(c), I(a) + d(a,c)\} = \min \{\infty, 20 + 82\} = 102$
 $I(d) = \min \{I(d), I(a) + d(a,d)\} = \min \{75, 20 + 92\} = 75$

** 'b' is now made permanent from node 's'

So that is what is shown here that here as remained and c becomes 102. So look we have recomputed c as 102, t still remains infinity last node to have made permanent was a and through which we have computed all these values and out of the remaining values, because these 2 were already permanent. Now 55 is the lowest, so we make it permanent. So now b is made permanent, so now s and b they are made permanent and this is also made from how the b, look here, we computed currently. So this mistake people make sometimes, so at this time we have made d and c permanent.

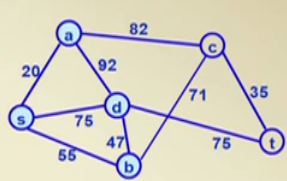

So you may be thinking that one of them should be now sorry d and c we have to recomputed. So one of them should be made permanent, no it should be the global minimum out of all the remaining nodes. So that is where the dynamic programming comes up, right. so it is note that their recent calculated values only should be made permanent out of all the remaining nodes, see s and a where already permanent out of all the remaining nodes that node should be made permanent, which one is the lowest possible level. So since, the level of b was 55, so b is made permanent. What the point so at the next round, the b is made permanent. So again we recomputed all the values, so you see from b you can reach c you can

reach d and you can reach t, you cannot reach t. So if you reach a c, the value is 55 plus 71, which is you know higher than 102. If you reach d again that value is higher than 75.

(Refer Slide Time: 9:10)

Dijkstra's Algorithm

Step 3	s	a	b	c	d	t
Temp label I(i)	0	20	55	102	75	∞
Perma- nent?	Yes	Yes	Yes	No	Yes	No
Made from	-	s	s	a	s	-

$I(c) = \min \{I(c), I(b) + d(b,c)\} = \min \{102, 55+71\} = 102$
 $I(d) = \min \{I(d), I(b) + d(b,d)\} = \min \{75, 55+47\} = 75^{**}$

** 'd' is now made permanent from node 's'

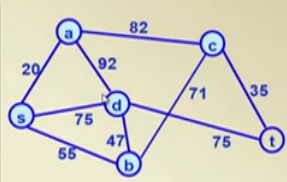

So at this point when b is made permanent and last node to have made permanent is b we have node you computation, right. The values that were available this t, but out of the remaining 3, now d becomes permanent, because d is the value which is 75. So now d is also made from see s not c s, so therefore now which one is lowest, so d. so d should be made permanent now.

(Refer Slide Time: 9:43)

Dijkstra's Algorithm

Step 4	s	a	b	c	d	t
Temp label I(i)	0	20	55	102	75	150
Perma nent?	Yes	Yes	Yes	Yes	Yes	No
Made from	-	s	s	a	s	-

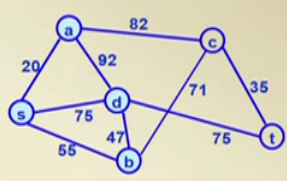

$I(c) = \text{Min} \{I(c), I(d) + d(d,c)\} = \text{Min} \{102, 75 + \infty\} = 102^{**}$
 $I(t) = \text{Min} \{I(t), I(d) + d(d,t)\} = \text{Min} \{\infty, 75 + 75\} = 150$

** 'c' is now made permanent from node 'a'

Dijkstra's Algorithm

Step 3	s	a	b	c	d	t
Temp label I(i)	0	20	55	102	75	∞
Perma nent?	Yes	Yes	Yes	No	Yes	No
Made from	-	s	s	a	s	-

$I(c) = \text{Min} \{I(c), I(b) + d(b,c)\} = \text{Min} \{102, 55 + 71\} = 102$
 $I(d) = \text{Min} \{I(d), I(b) + d(b,d)\} = \text{Min} \{75, 55 + 47\} = 75^{**}$

** 'd' is now made permanent from node 's'

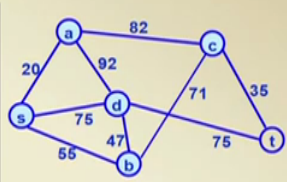

So at this round we have made d also as the permanent node, right.

(Refer Slide Time: 09:50)

Dijkstra's Algorithm

Step 4	s	a	b	c	d	t
Temp label l(i)	0	20	55	102	75	150
Perma- nent?	Yes	Yes	Yes	Yes	Yes	No
Made from	-	s	s	a	s	-

$l(c) = \text{Min} \{l(c), l(d) + d(d,c)\} = \text{Min} \{102, 75 + \infty\} = 102$ **
 $l(t) = \text{Min} \{l(t), l(d) + d(d,t)\} = \text{Min} \{\infty, 75 + 75\} = 150$

** 'c' is now made permanent from node 'a'

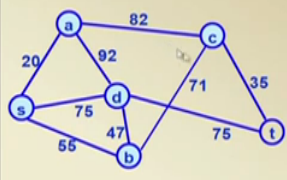

So actually now the at this round d was made permanent, after d is made permanent we again calculate at d you see we can compute t as 150 and c we do not change. So out of 102 and 150, since 75 is also there not permanent. So at this point 75 sorry, 75 was a last node to have made permanent. So we make 102 that is c as permanent, right.

(Refer Slide Time: 10:21)

Dijkstra's Algorithm

Step 4	s	a	b	c	d	t
Temp label l(i)	0	20	55	102	75	150
Perma- nent?	Yes	Yes	Yes	Yes	Yes	No
Made from	-	s	s	a	s	-

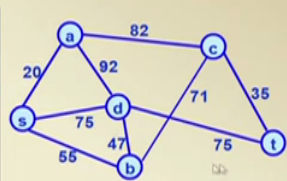

$l(c) = \text{Min} \{l(c), l(d) + d(d,c)\} = \text{Min} \{102, 75 + \infty\} = 102$ **
 $l(t) = \text{Min} \{l(t), l(d) + d(d,t)\} = \text{Min} \{\infty, 75 + 75\} = 150$

** 'c' is now made permanent from node 'a'

Dijkstra's Algorithm

Step 5	s	a	b	c	d	t
Temp label l(i)	0	20	55	102	75	137
Permanent?	Yes	Yes	Yes	Yes	Yes	Yes
Made from	-	s	s	a	s	c

$l(t) = \text{Min} \{l(t), l(c) + d(c,t)\} = \text{Min} \{150, 102+35\} = 137^{**}$

**** 't' is now made permanent from node 'c'**

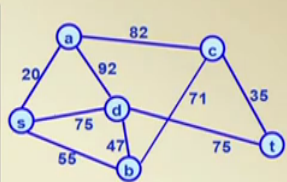

Proceeding like this at the last step, here we see that the value was 150 from c the distance is lower so we make at this point 137, because the value of c was 102 and now t will become 137. So t is now 137 because the value of c was 102 and now t will become 137. So t is now made permanent and we have completed all the nodes are now having permanent level. Is it all right? Sometimes if you really want only s to t distance if other nodes are not permanent, but t is permanent s is permanent we can get the distance from s to t if that is all that we want, right.

(Refer Slide Time: 11:07)

Dijkstra's Algorithm

Step 6	s	a	b	c	d	t
Temp label l(i)	0	20	55	102	75	137
Permanent?	Yes	Yes	Yes	Yes	Yes	Yes
Made from	-	s	s	a	s	c

Obtaining Shortest Path

't' is made permanent from 'c'. 'c' is made permanent from 'a', 'a' is made permanent from 's'.

Hence, shortest path from 's' to 't' is 's-a-c-t' and the shortest distance is 137.

So now this is our complete table. These are the labels no more temporary, they are all permanent. If all the levels are permanent and made from least is also available. So what we do t is made permanent from c, c is made permanent from a, a is made permanent from s. So

s to a to c to t that is the shortest path and that distance is 137, right. So that is Dijkstras algorithm explained to you once more time.

What I said that when there are negative distances then we have the bellman Bellmans Ford. This algorithm is nothing but an extension of force sorry, that Dijkstras algorithm, but only difference is that we cannot make any of the nodes permanent. Is it all right? So it is like an exploratory process. all the nodes has to be used for recompilations of the levels. So at every round keep computing the you know, the what you call the values again and again until you get a situation that no further levels are changing. So we will not discuss that in detail, but just remember when negative distances are involved, one requirement is there should be a loop, which has a total negative distance and second thing, we cannot make any of the nodes permanent.

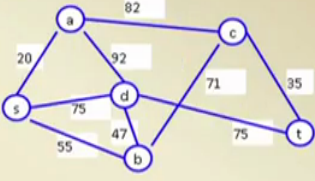

(Refer Slide Time: 13:00)

Shortest Path Exercise

Find Shortest Path in the graph shown from node s to node t using:

- **Dijkstra's Algorithm**

Also, find the length of the shortest path.

```
graph LR; s((s)) ---|20| a((a)); s ---|55| b((b)); s ---|75| d((d)); a ---|82| c((c)); a ---|92| d; b ---|47| d; b ---|75| t((t)); c ---|35| t; d ---|71| t;
```

Floyd's Algorithm – Shortest Path among All Pair of Nodes

Floyd's Algorithm is another algorithm to solve shortest path problems. This algorithm gives shortest path from any node to any other node by using a matrix method.

32

So all the nodes are candidates for calculation at all the rounds. So that is the difference, but we discuss now what is known as the Floyd's algorithm. The Floyd's algorithm essentially the idea is to by this method using a matrix method we can find out the shortest path from any node to any other node, right. So that is algorithm known as the Floyd's algorithm. How do we do that? So let us take this particular shortest path problem where there are 5 nodes and these are the distances. So we need to find out the shortest path from any node to any other node. How do we proceed?

(Refer Slide Time: 13:38)

Floyd's Algorithm

D (0)

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	∞	10	48	∞
L	10	10	∞	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

Distance Matrix

R (0)

	A	M	L	B	X
A	1	2	3	4	5
M	1	2	3	4	5
L	1	2	3	4	5
B	1	2	3	4	5
X	1	2	3	4	5

Route Matrix

So we make 2 matrixes, the first matrix is call the distance matrix and the second matrix is called the Route matrix. The distance matrix is you know the distances like infinity A to A and you know they are all infinity, X to M there is no such path. So it is also infinity, then like

M to X look no path from M to X, so infinity. So this is call the distance matrix and in this distance matrix, you know this is symmetrical in the sense that, because up and down both distances are same, but it need not be you know you can also take distances if A to M and M to A are different, right.

Now route matrix is a matrix which is very simple, simply take (1,1,1,1,1),(2,2,2,2,2) (3,3,3,3,3) and 4 and all 4 and all 5, right. All ones, all 2s, all 3s, all 4s and all 5. So simply take it. Now for convention although the node names are A, M,L,B and X we call them as 1,2,3,4,5 also at some time. Just remember A is 1, M is 2, L is 3, B is 4, X is 5. Now why they are not named as 1,2,3,4, 5 in the beginning because it will confuse you otherwise, because here also 1 and here also 1. So we will not be clear, but anyhow just remember that. So this is the first round.

(Refer Slide Time: 15:20)

Floyd's Algorithm

We highlight the 1st column and row of D(0) and 1st column of R(0) and compare all other items with the sum of the items highlighted in the same row and column. If the sum is less than the item then it should be replaced with the sum.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	∞	10	48	∞
L	10	10	∞	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

	A	M	L	B	X
A	1	2	3	4	5
M	1	2	3	4	5
L	1	2	3	4	5
B	1	2	3	4	5
X	1	2	3	4	5

D(0) Distance Matrix

R(0) Route Matrix

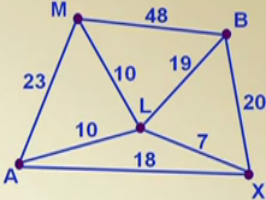

At the second round what we do? We highlight the first column and the first row, right we have highlighted the first column and the first row and here this column. So what is we do now we try to find out the distances through A, right. All the distances we are now finding through A, so M to X what is the distance through A? B to L what is the distance through A? See B to L current distance is 19. What is the distance from B to L through A you see A to L is 10 and B to A is infinity. So B to L through A is infinity out of infinity and 19 which one is lower, 19. So we keep 19, but B to A what is the current distance from A to B, infinity. What is the distance of B to A through A? There is no path, so we do not put any change to remain (∞)(16:35) it, let keep it infinity. What is the current distance from M to X or X to M is infinity. What is a distance from M to X through A through A the distance is 23 and 18 you

see, through A, the distance because A is now highlighted. So M to X through A will be 23 plus 18 that is 41, look here also, M to A is 23, A to X is 18, so 23 plus 18 is 41.

(Refer Slide Time: 17:33)

Floyd's Algorithm

See the **highlighted item in red** – the sum of yellow highlighted items in corresponding row and column is $23 + 23 = 46$ - **less than** the original value infinity. So the highlighted item in red will be replaced by 46.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	∞	10	48	∞
L	10	10	∞	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

	A	M	L	B	X
A	1	2	3	4	5
M	1	2	3	4	5
L	1	2	3	4	5
B	1	2	3	4	5
X	1	2	3	4	5

D(0) Distance Matrix R(0) Route Matrix

Floyd's Algorithm

We highlight the **1st** column and row of D(0) and **1st** column of R(0) and compare all other items with the sum of the items highlighted in the same row and column. If the sum is **less than** the item then it should be replaced with the sum.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	∞	10	48	∞
L	10	10	∞	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

	A	M	L	B	X
A	1	2	3	4	5
M	1	2	3	4	5
L	1	2	3	4	5
B	1	2	3	4	5
X	1	2	3	4	5

D(0) Distance Matrix R(0) Route Matrix

Floyd's Algorithm

D(0)

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	∞	10	48	∞
L	10	10	∞	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

Distance Matrix

R(0)

	A	M	L	B	X
A	1	2	3	4	5
M	1	2	3	4	5
L	1	2	3	4	5
B	1	2	3	4	5
X	1	2	3	4	5

Route Matrix

So very simply you simply look at the corresponding row and corresponding sorry, column and row and M to X is 23, sorry 18 here.

(Refer Slide Time: 17:34)

Floyd's Algorithm

We highlight the 1st column and row of D(0) and 1st column of R(0) and compare all other items with the sum of the items highlighted in the same row and column. If the sum is less than the item then it should be replaced with the sum.

D(0)

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	∞	10	48	∞
L	10	10	∞	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

D(0) Distance Matrix

R(0)

	A	M	L	B	X
A	1	2	3	4	5
M	1	2	3	4	5
L	1	2	3	4	5
B	1	2	3	4	5
X	1	2	3	4	5

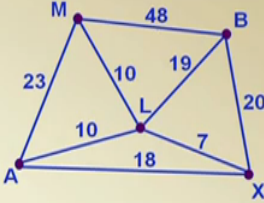

R(0) Route Matrix

So this is 23 plus 18 that will be 41, right. So that is how we proceed in this particular situation

(Refer Slide Time: 17:44)

Floyd's Algorithm

See the **highlighted item in red** – the sum of yellow highlighted items in corresponding row and column is $23 + 23 = 46$ - **less than** the original value infinity. So the highlighted item in red will be **replaced by 46**.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	∞	10	48	∞
L	10	10	∞	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

	A	M	L	B	X
A	1	2	3	4	5
M	1	2	3	4	5
L	1	2	3	4	5
B	1	2	3	4	5
X	1	2	3	4	5

D(0) Distance Matrix **R(0) Route Matrix**

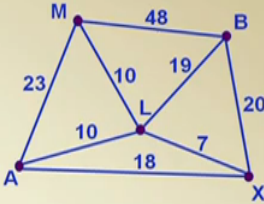

So look at this now M to M through A, you see M to M through A will be 46. Why because 23 plus 23 is 46, right.

(Refer Slide Time: 17:59)

Floyd's Algorithm

See the **highlighted item in red** – the sum of yellow highlighted items in corresponding row and column is $23 + 10 = 33$ - **more than** the original value 10! So the highlighted item in red will **remain** at 10.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	46	10	48	∞
L	10	10	∞	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

	A	M	L	B	X
A	1	2	3	4	5
M	1	2	3	4	5
L	1	2	3	4	5
B	1	2	3	4	5
X	1	2	3	4	5

D(0) Distance Matrix **R(0) Route Matrix**

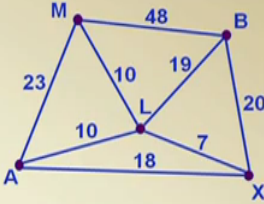

So look at this. This is currently 10 it should be how much, because 23 plus 10 is 33 more than 10, so it remains at 10.

(Refer Slide Time: 18:09)

Floyd's Algorithm

See the **highlighted item in red** – the sum of yellow highlighted items in corresponding row and column is $23 + 10 = 33$ – **more** than the original value 10! So the highlighted item in red will **remain** at 10.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	46	10	48	∞
L	10	10	∞	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

	A	M	L	B	X
A	1	2	3	4	5
M	1	2	3	4	5
L	1	2	3	4	5
B	1	2	3	4	5
X	1	2	3	4	5

D(0) Distance Matrix **R(0) Route Matrix**

Floyd's Algorithm

Using similar procedure, we complete the **2nd row**. See that 2 highlighted items are now changed in D(0) – to 46 and 41. Since changes are through Node 1 (i.e. A) Corresponding R(0) values are also **changed to 1**.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	46	10	48	41
L	10	10	∞	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

	A	M	L	B	X
A	1	2	3	4	5
M	1	1	3	4	1
L	1	2	3	4	5
B	1	2	3	4	5
X	1	2	3	4	5

D(0) Distance Matrix **R(0) Route Matrix**

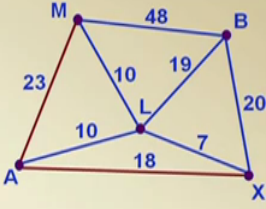

Now look at these value is currently you know it was infinity, but 23 plus 18 is 41, so it will now become 41, but every time you change you see like here we have change it to 46. So we change it to 1. Here we have change it to 41 and that is through 1 that is point A. So A so we write 1 here, but the point the so that is why is called route matrix that means M to X is 41 through 1 right that is a minimum 1.

(Refer Slide Time: 18:59)

Floyd's Algorithm

Using similar procedure, we complete the 3rd row. See that 1 highlighted item is now changed in D(0) – to 20. Since change is through Node 1 (i.e. A) Corresponding R(0) value is also changed to 1.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	46	10	48	41
L	10	10	20	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

	A	M	L	B	X
A	1	2	3	4	5
M	1	1	3	4	1
L	1	2	1	4	5
B	1	2	3	4	5
X	1	2	3	4	5

D(0) Distance Matrix R(0) Route Matrix

Floyd's Algorithm

Nothing changes in the 4th row. Because for none of the items, we have a lower sum of the corresponding 1st row and column highlighted values (in yellow). So no more changes in D(0) or R(0).

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	46	10	48	41
L	10	10	20	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

	A	M	L	B	X
A	1	2	3	4	5
M	1	1	3	4	1
L	1	2	1	4	5
B	1	2	3	4	5
X	1	2	3	4	5

D(0) Distance Matrix R(0) Route Matrix

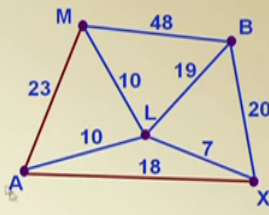

So now that we have made all computations from A to M you know we leave it here and we call it now this you see, the other side also this is 10 to 10 20 and this also changes. So through 1. So all the values we look at so these infinity will be 41 also. So nothing changes in the 4th row, because items.

(Refer Slide Time: 19:19)

Floyd's Algorithm

Nothing changes in the 4th row. Because for none of the items, we have a lower sum of the corresponding 1st row and column highlighted values (in yellow). So no more changes in D(0) or R(0).

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	46	10	48	41
L	10	10	20	19	7
B	∞	48	19	∞	20
X	18	∞	7	20	∞

	A	M	L	B	X
A	1	2	3	4	5
M	1	1	3	4	1
L	1	2	1	4	5
B	1	2	3	4	5
X	1	2	3	4	5

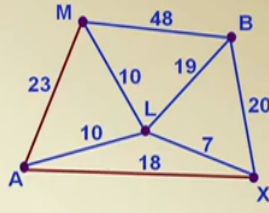

D(0) Distance Matrix

R(0) Route Matrix

Floyd's Algorithm

Using similar procedure, we complete the 5th row. See that 2 highlighted items are now changed in D(0) – to 41 and 36. Since change is through Node 1 (i.e. A) Corresponding R(0) values are also changed to 1.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	46	10	48	41
L	10	10	20	19	7
B	∞	48	19	∞	20
X	18	41	7	20	36

	A	M	L	B	X
A	1	2	3	4	5
M	1	1	3	4	1
L	1	2	1	4	5
B	1	2	3	4	5
X	1	1	3	4	1

D(0) Distance Matrix

R(0) Route Matrix

And then the 5th row you see, this 41 it was infinity infinity. Now it becomes 41 and 36 and there through 1.

(Refer Slide Time: 19:30)

Floyd's Algorithm

We now have **completed iterations with point 1** (i.e. A). Similar iterations are needed for the rest of the points.

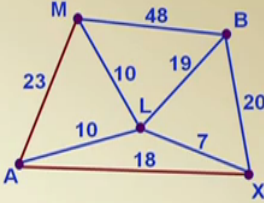

We therefore have now obtained **D(1)** and **R(1)**.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	46	10	48	41
L	10	10	20	19	7
B	∞	48	19	∞	20
X	18	41	7	20	36

D(1) Distance Matrix

	A	M	L	B	X
A	1	2	3	4	5
M	1	1	3	4	1
L	1	2	1	4	5
B	1	2	3	4	5
X	1	1	3	4	1

R(1) Route Matrix

So now we have computed and we get these two matrices which we can call D(1) and R(1). D(1) is the distance matrix; R(1) is the route matrix. How we have observed this? We have now got the original distances or all distances through 1 that is through A. Through the point A all distances are computed and all those values that have been changed they are now changed to 1, right. So this is my new distance matrix and we have got, but all that thing through 1. So this is the D(1), right.

(Refer Slide Time: 20:11)

Floyd's Algorithm

We highlight the 2nd column and row of D(1) and 2nd column of R(1); and compare all other items with the sum of the items highlighted in the same row and column. If the sum is less than the item then it should be replaced with the sum.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	46	10	48	41
L	10	10	20	19	7
B	∞	48	19	∞	20
X	18	41	7	20	36

	A	M	L	B	X
A	1	2	3	4	5
M	1	1	3	4	1
L	1	2	1	4	5
B	1	2	3	4	5
X	1	1	3	4	1

D(1) Distance Matrix

R(1) Route Matrix

Floyd's Algorithm

Using the procedure given, we find that 4 values are changed as highlighted in red to 46, 71, 71, and 96 respectively in D(1). Similarly, Corresponding values are changed in R(1) to 2 – because changes are through point 2 (i.e. M).

	A	M	L	B	X
A	46	23	10	71	18
M	23	46	10	48	41
L	10	10	20	19	7
B	71	48	19	96	20
X	18	41	7	20	36

	A	M	L	B	X
A	2	2	3	2	5
M	1	1	3	4	1
L	1	2	1	4	5
B	2	2	3	2	5
X	1	1	3	4	1

D(1) Distance Matrix

R(1) Route Matrix

Now after we have got D(1) now we highlighted 2. What is the point 2 that is M. so we highlight the rows and the columns of M and here look at the column M, right? So now look at what will be changing. This infinity will become 46, this 10 can it be 33, no. This infinity will now become 58. How? Let us look at, what is the distance from A to B is infinity, a same thing is B to A. Now if you go through M what will be that distance? That distance will be 23 plus 48 that is 71, because go to A to M and M to B it will be 71. So this infinity will now become 71, right. So we can now compute all such distances what about A to L, do not change.

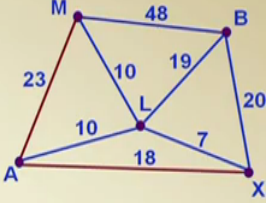

So you see keep doing it 23 plus 23, 23 plus 48, 23 plus 41, 41 plus 41, 82, but current value is 36. 48 plus 10 current value is 19, 48 plus 48, 96 when this infinity will become 96. So like

this we change. So you see these 4 values change at D(1) and R(1) through 1 and we get these changes in the matrix.

(Refer Slide Time: 21:40)

Floyd's Algorithm

We highlight the 2nd column and row of D(1) and 2nd column of R(1); and compare all other items with the sum of the items highlighted in the same row and column. If the sum is less than the item then it should be replaced with the sum.

	A	M	L	B	X
A	∞	23	10	∞	18
M	23	46	10	48	41
L	10	10	20	19	7
B	∞	48	19	∞	20
X	18	41	7	20	36

	A	M	L	B	X
A	1	2	3	4	5
M	1	1	3	4	1
L	1	2	1	4	5
B	1	2	3	4	5
X	1	1	3	4	1

D(1) Distance Matrix R(1) Route Matrix

Floyd's Algorithm

Using the procedure given, we find that 4 values are changed as highlighted in red to 46, 71, 71, and 96 respectively in D(1). Similarly, Corresponding values are changed in R(1) to 2 – because changes are through point 2 (i.e. M).

	A	M	L	B	X
A	46	23	10	71	18
M	23	46	10	48	41
L	10	10	20	19	7
B	71	48	19	96	20
X	18	41	7	20	36

	A	M	L	B	X
A	2	2	3	2	5
M	1	1	3	4	1
L	1	2	1	4	5
B	2	2	3	2	5
X	1	1	3	4	1

D(1) Distance Matrix R(1) Route Matrix

So look here these values where 1,1,4,4 we have now change them 2 to 2. So we have now got our new matrices that is D(1) and R(1) that means through 1 the values are obtained. Then what do we do logically you see and where do we stop? We started at D(0) and R(0) through all these distances we have computed now D(1) and R(1).

(Refer Slide Time: 22:15)

Floyd's Algorithm

We now have **completed iterations with point 2 (i.e. M)**. Similar iterations are needed for the rest of the points.

We therefore have now obtained **D(2) and R(2)**.

	A	M	L	B	X
A	46	23	10	71	18
M	23	46	10	48	41
L	10	10	20	19	7
B	71	48	19	96	20
X	18	41	7	20	36

	A	M	L	B	X
A	2	2	3	2	5
M	1	1	3	4	1
L	1	2	1	4	5
B	2	2	3	2	5
X	1	1	3	4	1

D(2) Distance Matrix

R(2) Route Matrix

Floyd's Algorithm

We highlight the **3rd column and row of D(2) and 3rd column of R(2)**; and compare all other items with the sum of the items highlighted in the same row and column. If the sum is **less** than the item then it should be **replaced** with the sum.

	A	M	L	B	X
A	46	23	10	71	18
M	23	46	10	48	41
L	10	10	20	19	7
B	71	48	19	96	20
X	18	41	7	20	36

	A	M	L	B	X
A	2	2	3	2	5
M	1	1	3	4	1
L	1	2	1	4	5
B	2	2	3	2	5
X	1	1	3	4	1

D(2) Distance Matrix

R(2) Route Matrix

And finally we have reached D(2) and R(2) matrix right, 1 was through A and 2 is through M right. So we have now obtained both D(2) and R(2). So both these matrices are now obtained. So after obtaining both D(2) and R(2) matrix next is should be the 3rd point. What is a 3rd point that is point B So that means row and column of these 3rd point that is B sorry the 3rd point was L that should be highlighted. So L now should be highlighted. So L is highlighted.

Now look what are some values that will change. These 46 will be 20 right these 46 also will become 20. This 48 will now become 29; this 41 will now become 17. So can you see lot of changes through L lot of distances are changing. This 96 will become 38, this 20 26 no change, this 36 will now become 14, So lot of changes will now take place through L, because the distances are smaller, right.

(Refer Slide Time: 23:30)

Floyd's Algorithm

Using the procedure given, we find that **14 values are changed** as highlighted in red to in D(2).
 Similarly, Corresponding values are changed in R(2) to 3 – because changes are through **point 3** (i.e. L).

	A	M	L	B	X
A	23	20	10	29	17
M	20	20	10	29	17
L	10	10	20	19	7
B	29	29	19	38	20
X	17	17	7	20	14

	A	M	L	B	X
A	3	3	3	3	3
M	3	3	3	3	3
L	1	2	1	4	5
B	3	3	3	3	5
X	3	3	3	4	3

D(2) Distance Matrix **R(2) Route Matrix**

So Exactly we have made all these changes as I we said look at 7 plus 7, 14, 19 plus 1 9, 38, then 19 plus 10, 29, 19 plus 10, 29 and all these changes will be now reflected in putting in this matrix 3 at the appropriate places, right. So once again how do we get D(3) and R(3) from D(2) and R (2). Basically the L is a 3rd point, so all the distances are to be recomputed by taking this row and this column and wherever the values are lower we replace them. So what exactly is happening? What is Floyd's algorithm?

The Floyd's algorithm if you really understand carefully, it is nothing but the application of Dijkstra's algorithm in a matrix form, right earlier we were applying Dijkstra's algorithm between only 2 points in a linear one dimensional situation. Here we are using for a 2 dimensional situation and if we go from D(0) R (0) to D(5) and R(5), all possible combinations are explored. So that is the essential idea of Floyd's algorithm, right.

(Refer Slide Time: 25:00)

Floyd's Algorithm

We now have **completed iterations** with point 3 (i.e. L). Similar iterations are needed for the rest of the points.

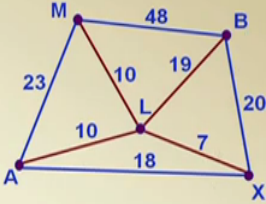

We therefore have now obtained **D(3)** and **R(3)**.

	A	M	L	B	X
A	20	20	10	29	17
M	20	20	10	29	17
L	10	10	20	19	7
B	29	29	19	38	20
X	17	17	7	20	14

	A	M	L	B	X
A	3	3	3	3	3
M	3	3	3	3	3
L	1	2	1	4	5
B	3	3	3	3	5
X	3	3	3	4	3

D(3) Distance Matrix

R(3) Route Matrix

Floyd's Algorithm

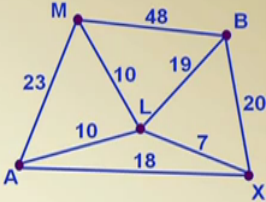

We highlight the **4th column** and row of D(3) and 4th column of R(3); and compare all other items with the sum of the items highlighted in the same row and column. If the sum is **less** than the item then it should be **replaced** with the sum.

	A	M	L	B	X
A	20	20	10	29	17
M	20	20	10	29	17
L	10	10	20	19	7
B	29	29	19	38	20
X	17	17	7	20	14

	A	M	L	B	X
A	3	3	3	3	3
M	3	3	3	3	3
L	1	2	1	4	5
B	3	3	3	3	5
X	3	3	3	4	3

D(3) Distance Matrix

R(3) Route Matrix

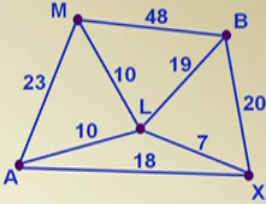

So we have obtained now D(2) and R(2) (25:01) and for from there D(3) and R(3). So the 3 points are explored. What will be our 4th point? The 4th point is B, right. So 4th point is B. Now look at the B is highlighted. Can you identify some points you know some values that will be changing at this time, just identify 29 plus 29, 29 plus 29, 19 plus 19, 19 plus 20, this think over. Are you getting anything which is changing here?

(Refer Slide Time: 25:44)

Floyd's Algorithm

As **no items** could be changed, we have now completed iterations with point 4 (i.e. B). Similar iterations are needed for the final point X. We therefore have now obtained **D(4)** and **R(4)**.

	A	M	L	B	X
A	20	20	10	29	17
M	20	20	10	29	17
L	10	10	20	19	7
B	29	29	19	38	20
X	17	17	7	20	14

	A	M	L	B	X
A	3	3	3	3	3
M	3	3	3	3	3
L	1	2	1	4	5
B	3	3	3	3	5
X	3	3	3	4	3

D(4) Distance Matrix **R(4) Route Matrix**

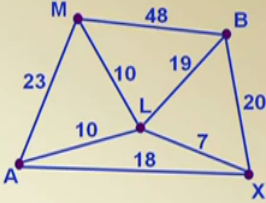

Let us see the result, we got nothing, right no item could be changed, because all the values through B, the values are higher like M to X, look at M to X, it was 17, but if you go through B, it will become 68. So we do not change anything. So we get what is known as D(4) and R(4).

(Refer Slide Time: 26:15)

Floyd's Algorithm

We highlight the **5th column** and **row** of D(4) and **5th column** of R(4); and compare all other items with the sum of the items highlighted in the same row and column. If the sum is **less** than the item then it should be **replaced** with the sum.

	A	M	L	B	X
A	20	20	10	29	17
M	20	20	10	29	17
L	10	10	20	19	7
B	29	29	19	38	20
X	17	17	7	20	14

	A	M	L	B	X
A	3	3	3	3	3
M	3	3	3	3	3
L	1	2	1	4	5
B	3	3	3	3	5
X	3	3	3	4	3

D(4) Distance Matrix **R(4) Route Matrix**

Floyd's Algorithm

Using the procedure given, we find that **1 value is changed** as highlighted in red to 14 as shown in D(4). Similarly, Corresponding value is changed in R(4) to 5 – because changes are through point 5 (i.e. X).

	A	M	L	B	X
A	20	20	10	29	17
M	20	20	10	29	17
L	10	10	14	19	7
B	29	29	19	38	20
X	17	17	7	20	14

	A	M	L	B	X
A	3	3	3	3	3
M	3	3	3	3	3
L	1	2	5	4	5
B	3	3	3	3	5
X	3	3	3	4	3

D(4) Distance Matrix **R(4) Route Matrix**

So now we come to our last point that is point number 5 that is X, right. So we highlighted the rows and the columns and here that particular column. So now tell me can you find any change? Look at all the distances 17 plus 17, what about this 22, see 7 plus 7, 14 it will change right 48 does not change, 37 37, 24, 34 27. So not much changing, but may be some changes would be there. So actually only one value is changing so that is this becomes now earlier it was 20 through 1, now it will become 14.

(Refer Slide Time: 27:09)

Floyd's Algorithm

Now the final matrices **D(5)** and **R(5)** are obtained. These matrices will give shortest distances from any point to any other point. For example, between **A to B**, the shortest distance is 29 (See D(5)) and the route is **A to L to B** (See R(5)).

	A	M	L	B	X
A	20	20	10	29	17
M	20	20	10	29	17
L	10	10	14	19	7
B	29	29	19	38	20
X	17	17	7	20	14

	A	M	L	B	X
A	3	3	3	3	3
M	3	3	3	3	3
L	1	2	5	4	5
B	3	3	3	3	5
X	3	3	3	4	3

D(5) Distance Matrix **R(5) Route Matrix**

So that now completes our matrix. So we have got this D (5) and R(5) right. So let us look at how to read this particular matrix. Suppose we need a distance from B to L. So B to L is distance as showing as 19. So shortest distance is a direct path that is 19 and through point number 3. So B to L and L is the 3rd point. So basically it is just through L only B to L

through point number L right that solve. So another distance what is a distance from A to B? A to B is 29 and it is through point number 3 that is M, sorry what is the point number 3 that is L. So A to B the shortest distance is A to L and L to B right. So you can study this.

(Refer Slide Time: 28:13)

And while doing that please solve this problem also right. please solve this problem also we have 5 points 1,2,3,4,5 and these are the distances use Floyd's algorithm, starts with $D(0)$ and $R(0)$ and use this method in a suitable manner and come out with the distances.

(Refer Slide Time: 28:36)

Solution to the Exercise on Floyd's Algorithm

	1	2	3	4	5	
1		60	30	40	45	77
2	30		30	50	15	47
3	40	50		70	35	67
4	45	15	35		30	32
5	77	47	67	32		64

D(5)

	1	2	3	4	5	
1		2	2	3	2	2
2	1		4	4	4	4
3	1	4		4	4	4
4	2	2	3		2	5
5	4	4	4	4		4

R(5)

For your reference I am giving the answer here. This is an answer. Now if you look at that answer one interesting thing will be found out which was not found in the previous example. What is the shortest path from 1 to 5? Now 1 to 5 the shortest path is 77 right 1 to 5, 77. How? Through 2, but if I see through 2, I find 1 to 2 is 30, but what is a shortest path 2 to 5. So we have to look at 2 to 5 also. So 2 to 5 is 47 and that is through 4. So you have to read like this, see 1 to 5, shortest path is 77, it is through 2 then we have to see 2 to 5 also. 2 to 5 shortest distance is 47 and it is through 4. So therefore 1 to 5 shortest distance is 1 to 2, 2 to 4, 4 to 5. Is all right? So that is exactly how you can work out Floyd's algorithm and we have really studied 3 important algorithms, Dijkstra's algorithm, Floyd's algorithm and although I have not said but I just mentioned the Bellman-Ford algorithm for negative distances, right. So thank you very much and that concludes our network portion.
