**Lecture – 47**  
**Seven QC Tools**

Hello friends, you are most welcome to our ongoing Six Sigma journey and I hope you are enjoying the learning of various topics; I can understand that we have gone through many lectures and discussed variety of the topics. So, you need to keep revising them frequently so that you can digest it properly, remember them and also you can apply. Now, we are in the lecture 47; last lecture we talked about Taguchi concept illustrative application. Today this particular lecture is about Seven QC Tools, Quality Control Tools.

(Refer Slide Time: 01:05)

Now, let us begin with a beautiful inspiration. If you do not know, how to ask the right question you discover nothing and this is what is said by none other than the great quality guru W. Edward Deming.

I will just share a small example. Many times at IIT students they come to me and then they will say sir then they will stop. They will just then utter some other word sentence and then they will stop. Now they would expect that without understanding what is their question I would be able to help them, that never happens. So, I never open my mouth,

unless they put their question define their question properly and once it is done I think, almost 70 percent of the problem is solved.

So, if you do not know how to ask the question, you are just say beating around the bush, then you do not achieve anything you discover nothing. It is a very important in great inside and that is why we are going through the various phases of DMAIC.

(Refer Slide Time: 02:25)

Now, we have gone through huge amount of quantum knowledge in this particular course so far and it is a time to have a quick recap what we have studied so far and where are we in our six sigma journey.

(Refer Slide Time: 02:43)

So, let us see we are devoted week 1 and 2 on discussing quality fundamentals and key concepts.

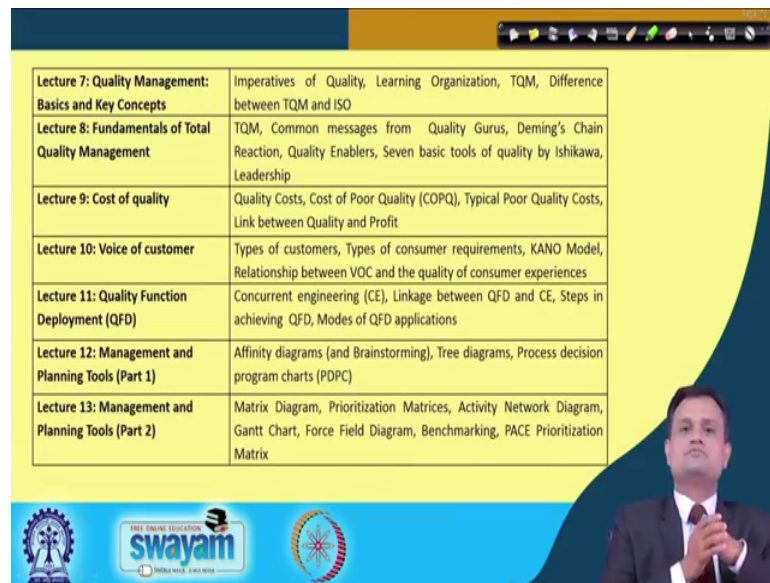

(Refer Slide Time: 02:53)

The slide displays a table with two columns: "Lecture" and "Course Structure, Course Coverage, Lecture Plan, Importance of six sigma, Expectation from the Course". The table lists six lectures. In the bottom right corner, a man in a suit is visible, gesturing with his right hand. The bottom of the slide contains logos for "swayam" and other educational institutions.

Lecture 1: Brief overview of the course	Course Structure, Course Coverage, Lecture Plan, Importance of six sigma, Expectation from the Course
Lecture 2: Quality concepts and definition	Dimensions of Quality, Role of various functions in the Organization towards Quality, Critical Challenges for Indian Organizations, Indian originations recipient of Quality Awards
Lecture 3: History of continuous improvement	Milestones in Quality, Evolution of Concept of Six Sigma, Integration of Concept of Value with Six Sigma, Certification
Lecture 4: Six Sigma Principles and Focus Areas (Part 1)	Six Sigma, Shift in Quality Paradigm, Difference between 3 Sigma and Six Sigma, DPMO, Calculating sigma level
Lecture 5: Six Sigma Principles and Focus Areas (Part 2)	Rolled Throughput Yield (RTY), Classic Yield, First Pass Yield (FPY), Hidden Factory, Six Sigma roles and responsibilities
Lecture 6: Six Sigma Applications	Indian organizations doing Six Sigma, Applications of six sigma in select Indian organizations, Challenges faced by Indian Organizations, Six Sigma benefits realized

So in that week 1, we have talked about the overview of the course, quality concept, definition, history of continuous improvement, various phases and six sigma principles and focus areas part 1, part 2, six sigma application.

(Refer Slide Time: 03:09)

Lecture 7: Quality Management: Basics and Key Concepts	Imperatives of Quality, Learning Organization, TQM, Difference between TQM and ISO
Lecture 8: Fundamentals of Total Quality Management	TQM, Common messages from Quality Gurus, Deming's Chain Reaction, Quality Enablers, Seven basic tools of quality by Ishikawa, Leadership
Lecture 9: Cost of quality	Quality Costs, Cost of Poor Quality (COPQ), Typical Poor Quality Costs, Link between Quality and Profit
Lecture 10: Voice of customer	Types of customers, Types of consumer requirements, KANO Model, Relationship between VOC and the quality of consumer experiences
Lecture 11: Quality Function Deployment (QFD)	Concurrent engineering (CE), Linkage between QFD and CE, Steps in achieving QFD, Modes of QFD applications
Lecture 12: Management and Planning Tools (Part 1)	Affinity diagrams (and Brainstorming), Tree diagrams, Process decision program charts (PDPC)
Lecture 13: Management and Planning Tools (Part 2)	Matrix Diagram, Prioritization Matrices, Activity Network Diagram, Gantt Chart, Force Field Diagram, Benchmarking, PACE Prioritization Matrix

The slide also features logos for Swamyam and other educational institutions at the bottom, and a video feed of a man in a suit in the bottom right corner.

Week 2, we talked about basically quality management, TQM, cost of quality, voice of customer, quality function deployment, management and planning tools and this we have discussed in detail; management and planning tools in part 1 and part 2.

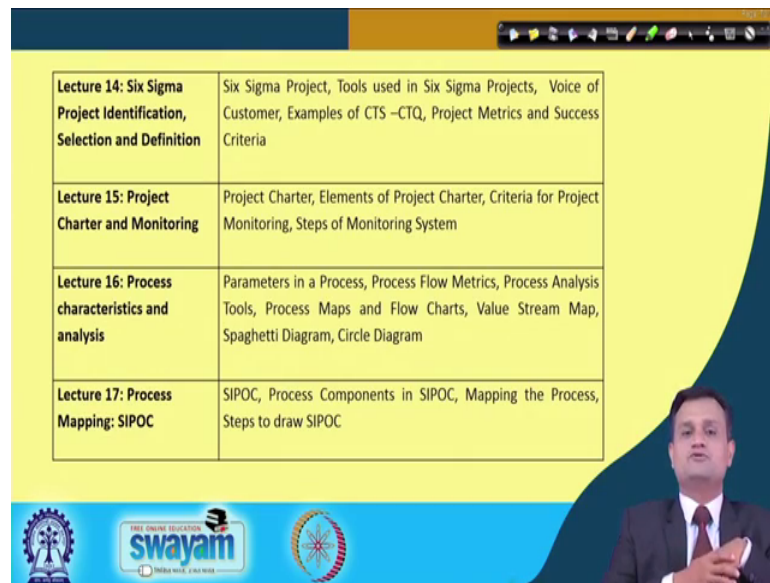

(Refer Slide Time: 03:29)

Then, we started with the DMAIC cycle, and the first phase was the define we talked about define phase in week 3.

(Refer Slide Time: 03:39)

<b>Lecture 14: Six Sigma Project Identification, Selection and Definition</b>	Six Sigma Project, Tools used in Six Sigma Projects, Voice of Customer, Examples of CTS –CTQ, Project Metrics and Success Criteria
<b>Lecture 15: Project Charter and Monitoring</b>	Project Charter, Elements of Project Charter, Criteria for Project Monitoring, Steps of Monitoring System
<b>Lecture 16: Process characteristics and analysis</b>	Parameters in a Process, Process Flow Metrics, Process Analysis Tools, Process Maps and Flow Charts, Value Stream Map, Spaghetti Diagram, Circle Diagram
<b>Lecture 17: Process Mapping: SIPOC</b>	SIPOC, Process Components in SIPOC, Mapping the Process, Steps to draw SIPOC

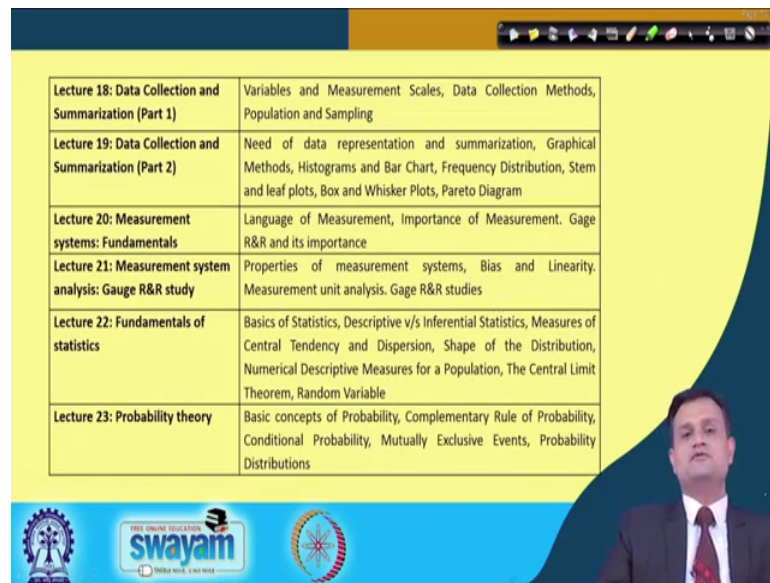

And as a part of that, we have seen the project identification, definition, selection, project charter and monitoring, process characteristic and analysis, process mapping using a very important tool SIPOC.

(Refer Slide Time: 03:53)

Then we entered into the measure phase week 4 and 5; and this week 4, basically we talked about data collection.

(Refer Slide Time: 03:59)

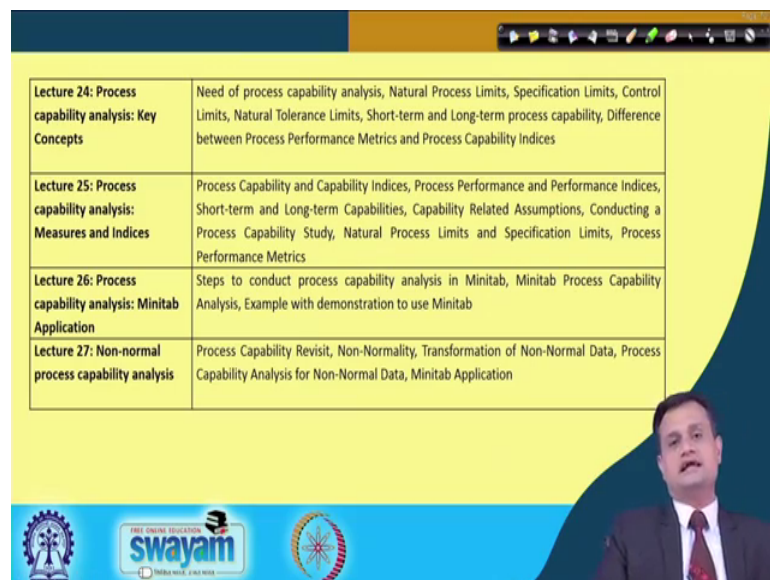

Lecture 18: Data Collection and Summarization (Part 1)	Variables and Measurement Scales, Data Collection Methods, Population and Sampling
Lecture 19: Data Collection and Summarization (Part 2)	Need of data representation and summarization, Graphical Methods, Histograms and Bar Chart, Frequency Distribution, Stem and leaf plots, Box and Whisker Plots, Pareto Diagram
Lecture 20: Measurement systems: Fundamentals	Language of Measurement, Importance of Measurement, Gage R&R and its importance
Lecture 21: Measurement system analysis: Gauge R&R study	Properties of measurement systems, Bias and Linearity, Measurement unit analysis, Gage R&R studies
Lecture 22: Fundamentals of statistics	Basics of Statistics, Descriptive v/s Inferential Statistics, Measures of Central Tendency and Dispersion, Shape of the Distribution, Numerical Descriptive Measures for a Population, The Central Limit Theorem, Random Variable
Lecture 23: Probability theory	Basic concepts of Probability, Complementary Rule of Probability, Conditional Probability, Mutually Exclusive Events, Probability Distributions

The slide also features logos for IIT Bombay, Swamyam, and a circular emblem at the bottom, along with a video feed of a man in a suit in the bottom right corner.

We divided it into two part, measurement system fundamental, measurement system gauge R and R study, fundamentals of statistics, probability theory.

(Refer Slide Time: 04:13)

Lecture 24: Process capability analysis: Key Concepts	Need of process capability analysis, Natural Process Limits, Specification Limits, Control Limits, Natural Tolerance Limits, Short-term and Long-term process capability, Difference between Process Performance Metrics and Process Capability Indices
Lecture 25: Process capability analysis: Measures and Indices	Process Capability and Capability Indices, Process Performance and Performance Indices, Short-term and Long-term Capabilities, Capability Related Assumptions, Conducting a Process Capability Study, Natural Process Limits and Specification Limits, Process Performance Metrics
Lecture 26: Process capability analysis: Minitab Application	Steps to conduct process capability analysis in Minitab, Minitab Process Capability Analysis, Example with demonstration to use Minitab
Lecture 27: Non-normal process capability analysis	Process Capability Revisit, Non-Normality, Transformation of Non-Normal Data, Process Capability Analysis for Non-Normal Data, Minitab Application

The slide also features logos for IIT Bombay, Swamyam, and a circular emblem at the bottom, along with a video feed of a man in a suit in the bottom right corner.

And in week 5, we talked about process capability analysis, indices, process capability analysis in mini tab and non normal process capability also with application in mini tab.

(Refer Slide Time: 04:27)

Then we entered into the analyze phase. So, DMA we are going in a very very structured manner so that, lifelong you will not have any difficulty in understanding the concepts of sigma and applying this concept for the selected problem. So, analyse phase was covered in week 6 and week 7.

(Refer Slide Time: 04:53)

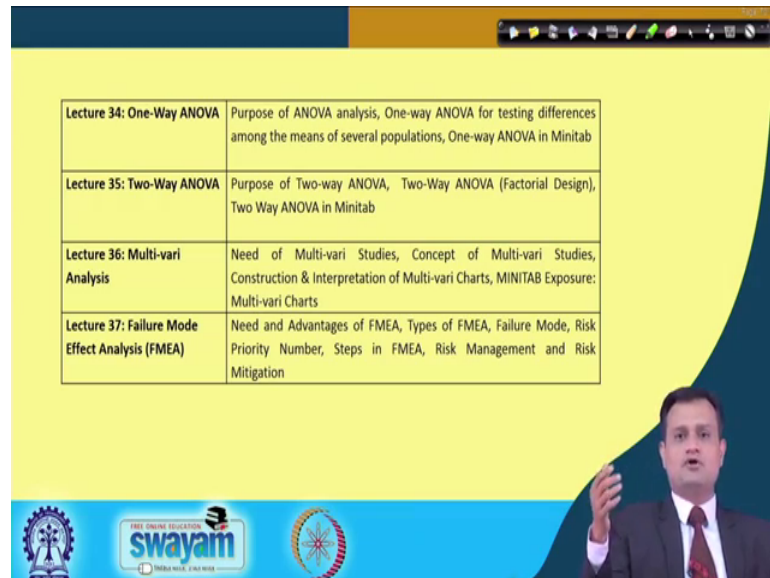

The slide displays a table with lecture topics and their descriptions. The table is as follows:

Lecture 28: Hypothesis testing: Fundamentals	Statistical Hypothesis, Null and Alternative Hypothesis, Type I and Type II Errors in hypothesis testing, General Steps in Hypothesis Testing, Approaches to Hypothesis Testing: Approach 1: Critical Value; Approach 2: p-value; Approach 3: Confidence Interval
Lecture 29: Hypothesis Testing: Single Population Test	Hypothesis testing for a Single Population Mean using $z$ statistic, $t$ statistic, for Proportion
Lecture 30: Hypothesis Testing: Two Population Test	Hypothesis testing for comparing the difference between a) The means of two independent populations; b) The proportions of two independent populations; c) The variances of two independent populations by testing the ratio of the two variances; d) Dependent (Related) Samples (Same group before vs. after treatment)
Lecture 31: Hypothesis Testing: Two Population: Minitab Application	Minitab applications for a) Pooled-Variance $t$ Test Example; b) Comparison of two population proportions
Lecture 32: Correlation and Regression Analysis	Correlation analysis, Predicting the value of a dependent variable based on an independent variables, Evaluating the assumptions of regression analysis
Lecture 33: Regression Analysis: Model Validation	Autocorrelation, Durbin-Watson statistic, The $t$ -test and $F$ test, Pitfalls of regression analysis

And week 6, basically we talked about, analysis through hypothesis testing, hypothesis testing for 1 population, for 2 population and we had also seen for the convenience; how

this can be done in mini tab, correlation, correlation and regression analysis and model validation of the regression analysis.

(Refer Slide Time: 05:13)

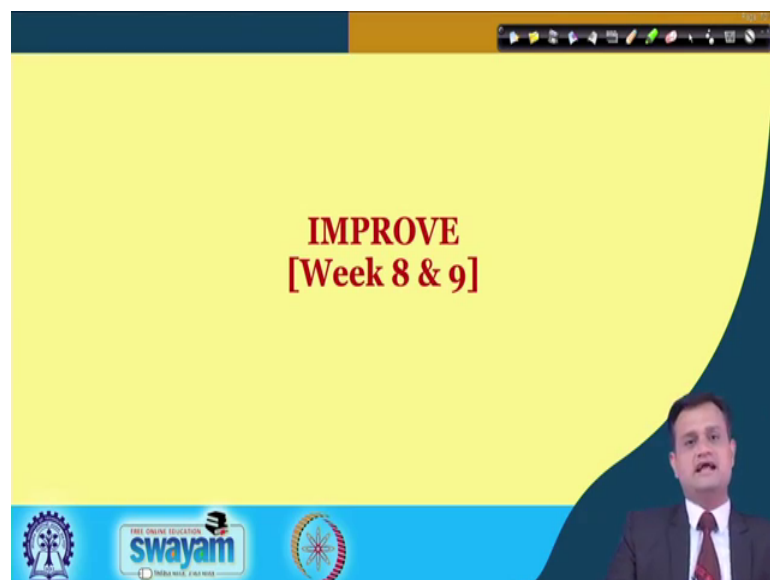

The slide features a table with four rows of lecture topics. The first row is 'Lecture 34: One-Way ANOVA' with a description of its purpose and Minitab application. The second row is 'Lecture 35: Two-Way ANOVA' with a description of its purpose and Minitab application. The third row is 'Lecture 36: Multi-vari Analysis' with a description of its need and Minitab exposure. The fourth row is 'Lecture 37: Failure Mode Effect Analysis (FMEA)' with a description of its need and risk management steps. The slide also includes logos for Swamyam and a presenter in the bottom right corner.

Lecture 34: One-Way ANOVA	Purpose of ANOVA analysis, One-way ANOVA for testing differences among the means of several populations, One-way ANOVA in Minitab
Lecture 35: Two-Way ANOVA	Purpose of Two-way ANOVA, Two-Way ANOVA (Factorial Design), Two Way ANOVA in Minitab
Lecture 36: Multi-vari Analysis	Need of Multi-vari Studies, Concept of Multi-vari Studies, Construction & Interpretation of Multi-vari Charts, MINITAB Exposure: Multi-vari Charts
Lecture 37: Failure Mode Effect Analysis (FMEA)	Need and Advantages of FMEA, Types of FMEA, Failure Mode, Risk Priority Number, Steps in FMEA, Risk Management and Risk Mitigation

Week 7 we continued in the analysed phase and we talked about one way ANOVA, two way ANOVA, multi vary analysis and failure mode effect analysis.

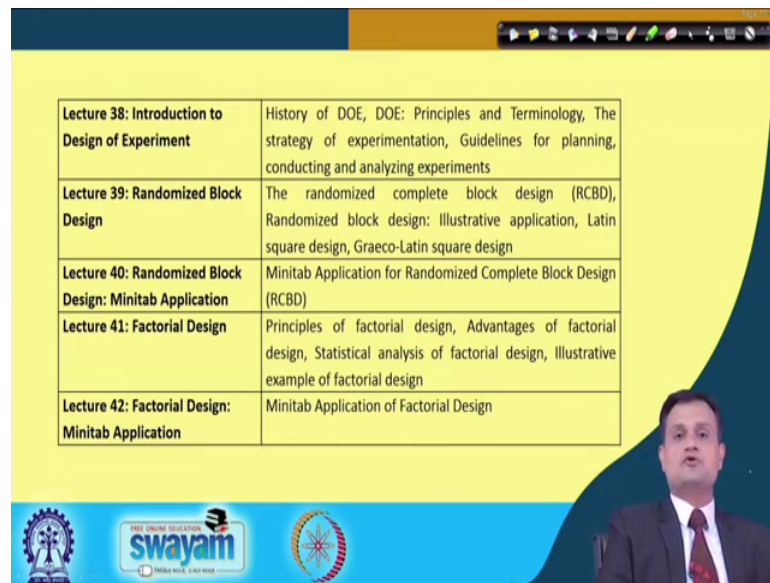

(Refer Slide Time: 05:27)

The slide is titled 'IMPROVE [Week 8 & 9]' in red text. It features logos for Swamyam and a presenter in the bottom right corner.

Then we entered into the improve face and week 8 and week 9 were devoted.

(Refer Slide Time: 05:29)

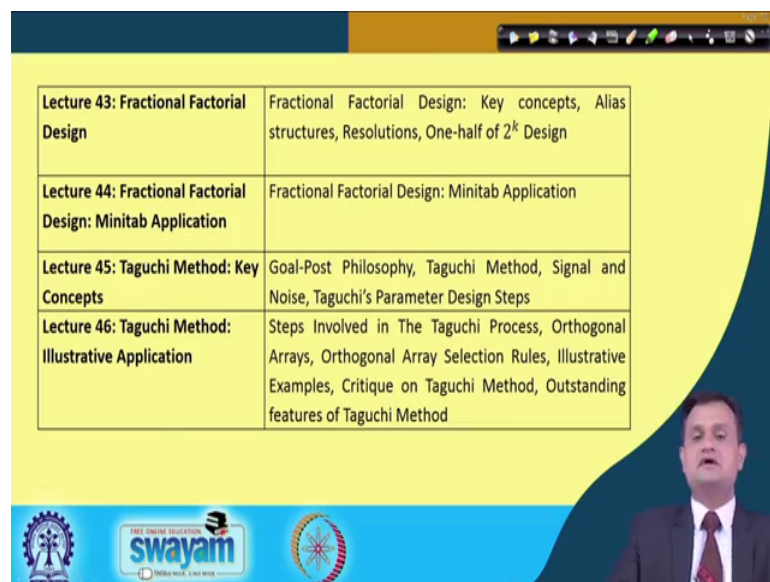

<b>Lecture 38: Introduction to Design of Experiment</b>	History of DOE, DOE: Principles and Terminology, The strategy of experimentation, Guidelines for planning, conducting and analyzing experiments
<b>Lecture 39: Randomized Block Design</b>	The randomized complete block design (RCBD), Randomized block design: Illustrative application, Latin square design, Graeco-Latin square design
<b>Lecture 40: Randomized Block Design: Minitab Application</b>	Minitab Application for Randomized Complete Block Design (RCBD)
<b>Lecture 41: Factorial Design</b>	Principles of factorial design, Advantages of factorial design, Statistical analysis of factorial design, Illustrative example of factorial design
<b>Lecture 42: Factorial Design: Minitab Application</b>	Minitab Application of Factorial Design

The slide also features logos for IIT Bombay, Swayam, and the Ministry of Education at the bottom, and a video feed of a male presenter in a suit on the right side.

So, week 8 say basically talked about introduction to DOE, randomised block design, randomized block design, miniature application, factorial design with mini tab application.

(Refer Slide Time: 05:43)

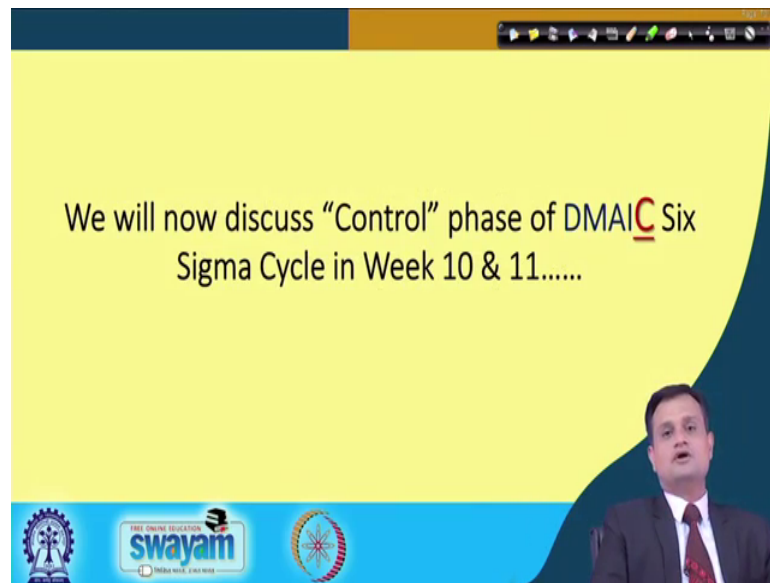

<b>Lecture 43: Fractional Factorial Design</b>	Fractional Factorial Design: Key concepts, Alias structures, Resolutions, One-half of $2^k$ Design
<b>Lecture 44: Fractional Factorial Design: Minitab Application</b>	Fractional Factorial Design: Minitab Application
<b>Lecture 45: Taguchi Method: Key Concepts</b>	Goal-Post Philosophy, Taguchi Method, Signal and Noise, Taguchi's Parameter Design Steps
<b>Lecture 46: Taguchi Method: Illustrative Application</b>	Steps Involved in The Taguchi Process, Orthogonal Arrays, Orthogonal Array Selection Rules, Illustrative Examples, Critique on Taguchi Method, Outstanding features of Taguchi Method

The slide also features logos for IIT Bombay, Swayam, and the Ministry of Education at the bottom, and a video feed of a male presenter in a suit on the right side.

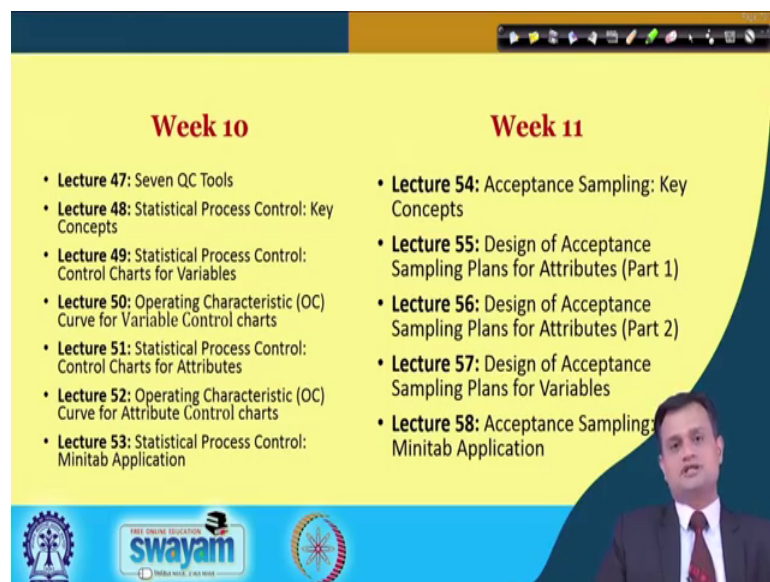

Week 9, we focused on fractional factorial, fractional factorial in mini tab, Taguchi method and illustrative example of the Taguchi method which be covered in the last lecture. So, you can see that we have covered a huge amount of say quantum, in our systematic journey of DMAIC.

(Refer Slide Time: 06:07)

And now, you will have a little feel of relaxation that we are now in the final phase of our DMAIC cycle that is the control phase. So, week 10 and week 11 is devoted towards the control phase of my DMAIC cycle.

(Refer Slide Time: 06:29)

And as a part of this, I would like to discuss lecture 47 that is this lecture seven QC tool, 48 statistical process control key concepts, statistical process control for variables, then operating characteristic curve for variable control charts, statistical process control for

attributes, then statistical operating characteristic curve for the attributes. Very systematically the plan is drawn.

So, that you do not have any confusion and then the application of statistical process control in mini tab. Week 11; Lecture 54 is about acceptance sampling key concepts; 55 design of acceptance sampling for attributes, it is a long topics. So, it is divided into part 1 and part 2, lecture 55 and 56. Then lecture 57, design of acceptance sampling for variables and 58 acceptance sampling in mini tab. So, you can see that week 10 is totally devoted on statistical process control and week 11 is acceptance sampling which is also a part of statistical process control.

(Refer Slide Time: 07:43)

So now we would like to cover in this particular lecture, need of QC approach, benefit of QC approach and there are traditional seven QC tools. Couple of them we have already discussed. But I would just like to have a quick revision because, usually any book if you refer then it is a classical topic that, what are the seven QC tools.

(Refer Slide Time: 08:09)

**Problem Solving**

- How to Know that there is a problem?
- Diagnostics?
- Analysis
- Interpretation

**Problem Solvers**

- Self-negating/despairing type
- "Someone else's fault" type
- Ostrich Type
- QC Problem solving type

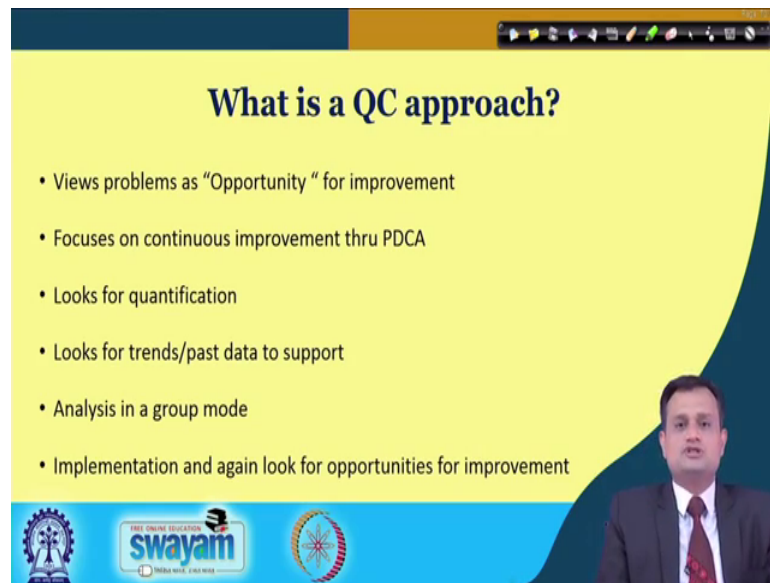

swayam

So, let us see that problem solving and problem solver. And when I say, how to know that, there is a problem, diagnostic, analysis, interpretation it is about problem solving. Now, when you just solver, you may have self negating or despairing type, you may discuss and self negating approach you may have. Someone else fault types it is not my fault, you will just try to get rid of that, then ostrich type and you can have QC problem solving approach. So, obviously, we need the solver, which are scientifically design and can really help me to avoid the conflict internal or external and convince the people for the right cause of the problem.

So QC tool; basically, is a seven QC tool helps me to get hold on my situation problem in scientific way and convince the people about the real cause of the problem.

(Refer Slide Time: 09:17)

### What is a QC approach?

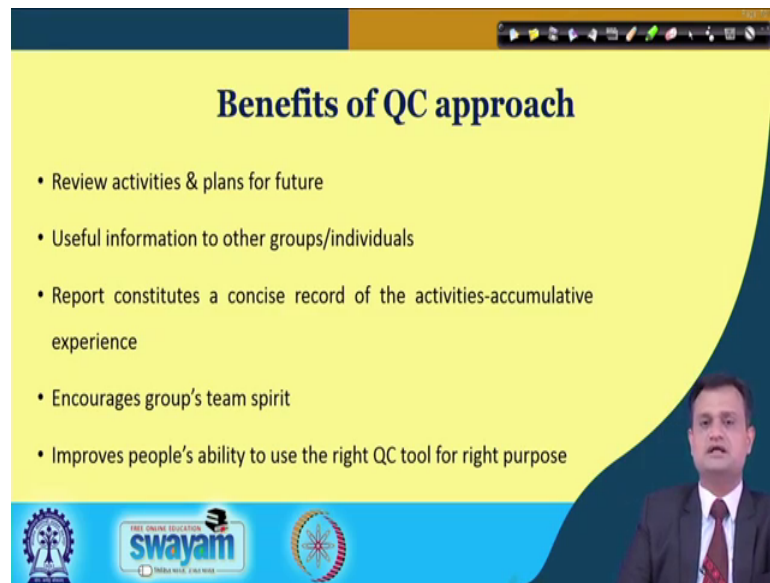

- Views problems as “Opportunity “ for improvement
- Focuses on continuous improvement thru PDCA
- Looks for quantification
- Looks for trends/past data to support
- Analysis in a group mode
- Implementation and again look for opportunities for improvement

Logos at the bottom: Swayam, All India Institute of Management, and others.

So, what is the QC approach? So, typically views problem as opportunity for improvement very very important. Many a times in the life, personal or professional we just try to avoid the problem, we just try to hide the problem, but QC approach says consider the problem as an opportunity. Then focus is on continuous improvement through PDCA; Plan Do Check Act, we have seen this cycle also, looks for quantification, then looks for trends past data to support that what is happening and what can happen in the future. Analysis in group mode; so nobody can blame. You are taking the inputs from the people you are doing brainstorming so, it is a group based approach.

And implementation and again look for opportunities for improvement. So, it is a complete PDCA cycle keep revising, keep checking, keep planning, doing, acting and then you can reach to the six sigma level.

(Refer Slide Time: 10:21)

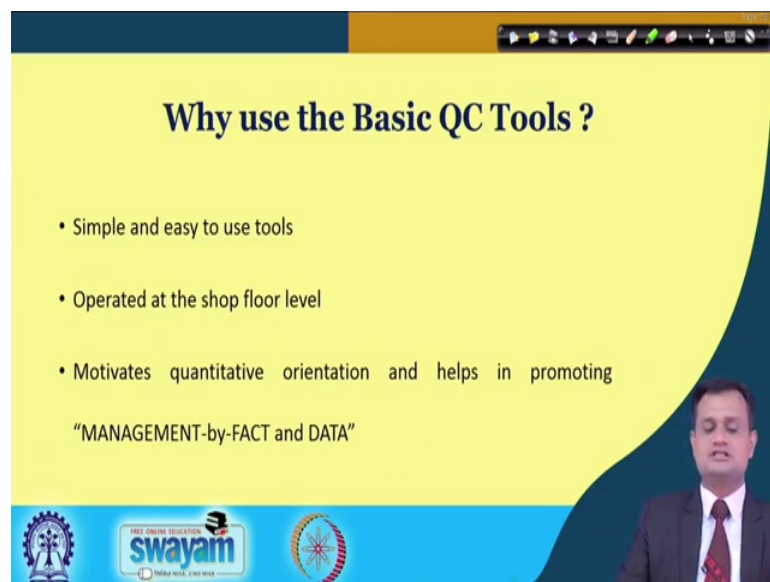

**Benefits of QC approach**

- Review activities & plans for future
- Useful information to other groups/individuals
- Report constitutes a concise record of the activities-accumulative experience
- Encourages group's team spirit
- Improves people's ability to use the right QC tool for right purpose

The slide features a yellow background with a dark blue curved border on the right. At the bottom, there is a blue banner with logos for 'swayam' and other educational institutions. A presenter in a suit is visible in the bottom right corner.

So, there are various approaches as I mentioned that it basically helps you to get hold on the situation and improve it continuously, and when you are involving the people it also improves the moral participation of the employee.

(Refer Slide Time: 10:39)

**Why use the Basic QC Tools ?**

- Simple and easy to use tools
- Operated at the shop floor level
- Motivates quantitative orientation and helps in promoting "MANAGEMENT-by-FACT and DATA"

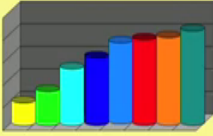

The slide features a yellow background with a dark blue curved border on the right. At the bottom, there is a blue banner with logos for 'swayam' and other educational institutions. A presenter in a suit is visible in the bottom right corner.

So, simple and easy to use tools, motivates the people to go by MANAGEMENT-by-FACT and DATA, not by Whims and Fancies, not by intuitions, let us have black and white. So, let us try to separate it and let us try to convince the people for the real cause of the problem.

(Refer Slide Time: 11:01)

### What are the seven QC Tools?

- Check sheet ✓
- Histograms ✓
- Stratification (alternately, flow or run chart) ✓
- Pareto Diagrams ✓
- Cause and Effect Diagrams ✓
- Scatter Diagrams ✓
- Control Charts ✓

swayam

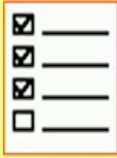

So, what are the typical seven QC tools? So, you can see here that check sheet, it is a very well known tool, histogram, then stratification, pareto diagram, cause and effect, scatter diagram and control chart.

So, I will give you the brief idea of each of the tool and control chart, I will give you the brief, but as you have seen we will discuss this particular topic in a greater detail and we will see the design of control chart for variables as well as attributes.

(Refer Slide Time: 11:41)

### Check sheet

- The function of a check sheet is to present information in an efficient, graphical format. ✓
- This may be accomplished with a simple listing of items. However, the utility of the check sheet may be significantly enhanced, in some instances, by incorporating a depiction of the system under analysis into the form.

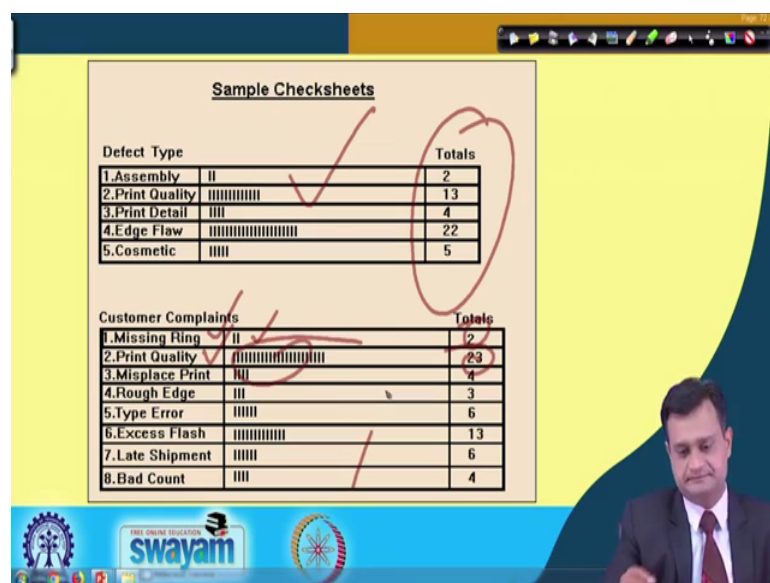

Check Sheet

swayam

So, with this say brief overview, let us try to study the tool quickly, because many of the tools you know or we have discussed previously. So, check sheet is a very very simple tool. Say you will find a check sheet hanging on the machine panel and let us say it is a check sheet for cleaning, check sheet for maintenance. And then a person is only need to check it out. You will find, if you visit airport then just back side of the door you will find the cleaning schedule in check sheet. Similar way cleaning schedule is displayed in the form of check sheet in hospitals. So, it is a very simple tool, to see that where the process stand, what is the present progress and what is to be done, what is left over.

(Refer Slide Time: 12:37)

**Sample Checksheets**

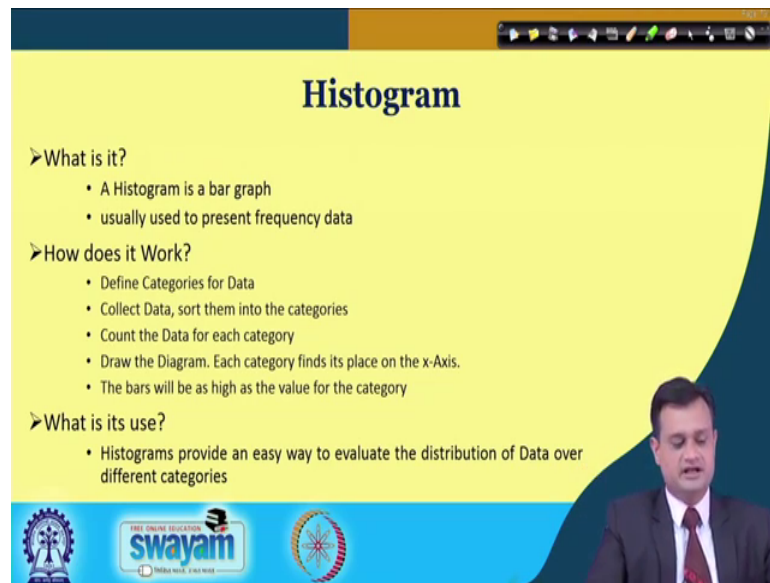

Defect Type	Totals
1.Assembly	2
2.Print Quality	13
3.Print Detail	4
4.Edge Flaw	22
5.Cosmetic	5

Customer Complaints	Totals
1.Missing Ring	2
2.Print Quality	23
3.Misplace Print	4
4.Rough Edge	3
5.Type Error	6
6.Excess Flash	13
7.Late Shipment	6
8.Bad Count	4

So, this is the benefit of check sheet which is a very simple tool to follow by even a very very less knowledgeable person say unqualified person and you can also say put a tally here and count the total, that how many times this is being checked, how many time this is being cleaned. So, missing ring to tallies to print quality, so many 23 and then you will get an idea; so, this is my check sheet.

(Refer Slide Time: 13:07)

## Histogram

➤What is it?

- A Histogram is a bar graph
- usually used to present frequency data

➤How does it Work?

- Define Categories for Data
- Collect Data, sort them into the categories
- Count the Data for each category
- Draw the Diagram. Each category finds its place on the x-Axis.
- The bars will be as high as the value for the category

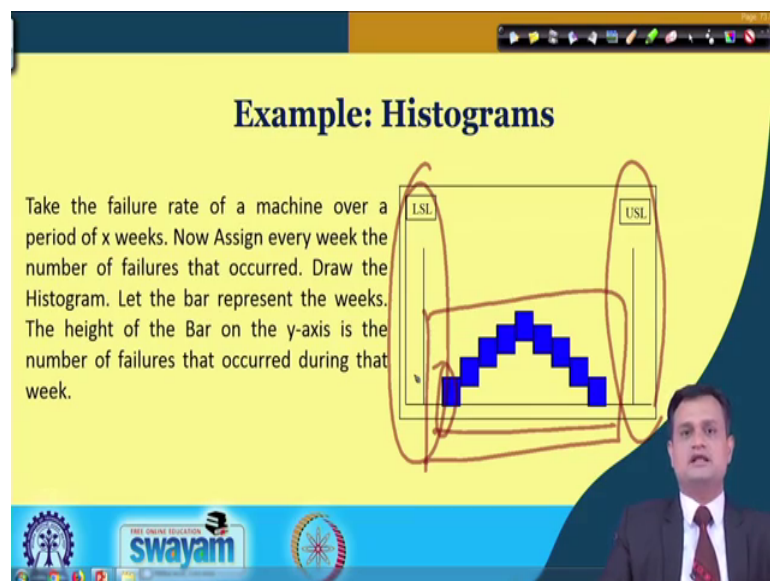

➤What is its use?

- Histograms provide an easy way to evaluate the distribution of Data over different categories

The slide features a yellow background with a blue sidebar on the right containing a video feed of a man in a suit. At the bottom, there are logos for 'swayam' and 'INDIA WISE, YOUNG WISE'.

Now, the second one is histogram, basically it is a kind of bar chart and bar graph and typically used to present the frequency data. So, define the categories for the data, sort them out we have seen this in detail. And this provides an easy way to evaluate the distribution of the data. So, we have seen that whenever say you try to analyse your validity of your model regression or rather, your mini tab output will give you the histogram, as well as normal probability plot. So, first end idea you can have the how my data is distributed.

(Refer Slide Time: 13:45)

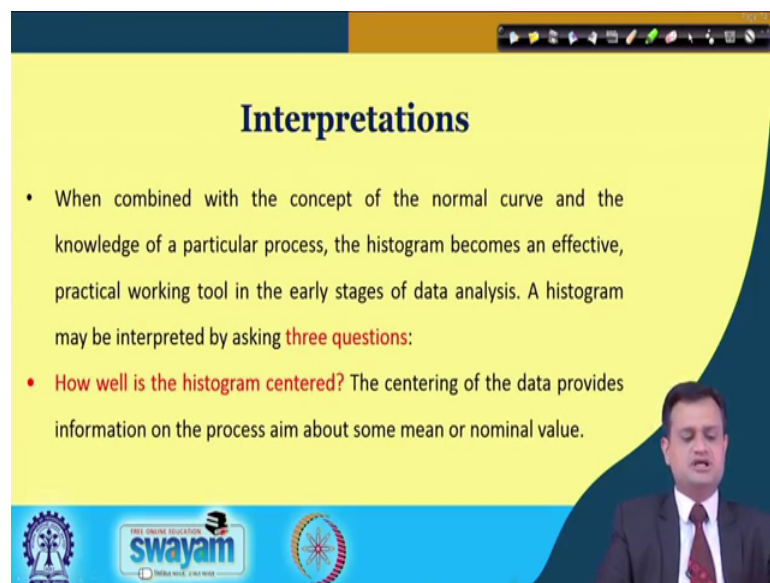

## Example: Histograms

Take the failure rate of a machine over a period of  $x$  weeks. Now Assign every week the number of failures that occurred. Draw the Histogram. Let the bar represent the weeks. The height of the Bar on the y-axis is the number of failures that occurred during that week.

The slide features a yellow background with a blue sidebar on the right containing a video feed of a man in a suit. A hand-drawn histogram is shown in the center, with blue bars representing the frequency of failures over time. The histogram is enclosed in a red oval, and the x-axis is labeled 'LSL' and 'USL'. At the bottom, there are logos for 'swayam' and 'INDIA WISE, YOUNG WISE'.

So, this is what is histogram all about and just see these example; that my machine is failing and over a period of x week I want to see. Suppose this is the maximum limit or upper specification, lower specification within this the failure of machine, this is the number of time machine has failed in a particular week, how the distribution is. I can at least figure out that whether in a particular week or particular month or particular day whatever may be the time window, something is really going worse or it is just a normal phenomena.

(Refer Slide Time: 14:25)

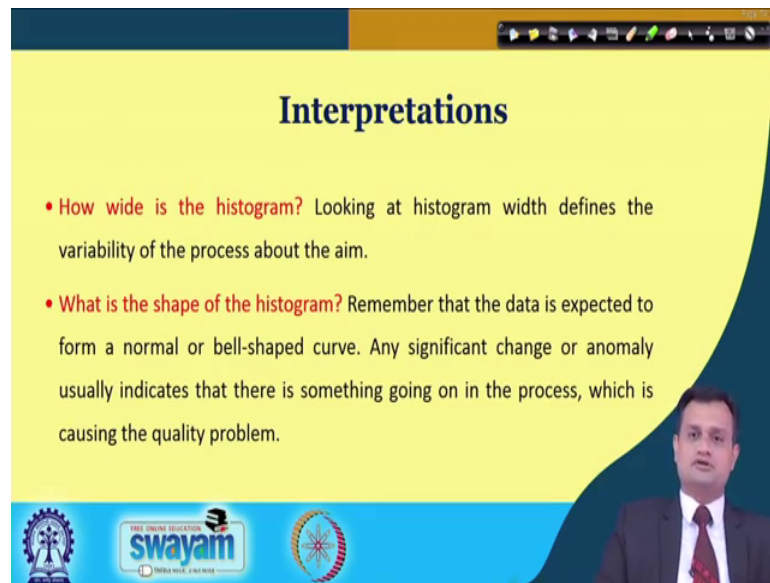

### Interpretations

- When combined with the concept of the normal curve and the knowledge of a particular process, the histogram becomes an effective, practical working tool in the early stages of data analysis. A histogram may be interpreted by asking **three questions**:
- **How well is the histogram centered?** The centering of the data provides information on the process aim about some mean or nominal value.

So, the interpretations are three; basically, how well the histogram is centred? So, centring of the data provides information, that whether my process is centred at or nominal value or not. What is the spread? So it gives me the idea about the variability of my data set and shape, it may be skewed.

(Refer Slide Time: 14:39)

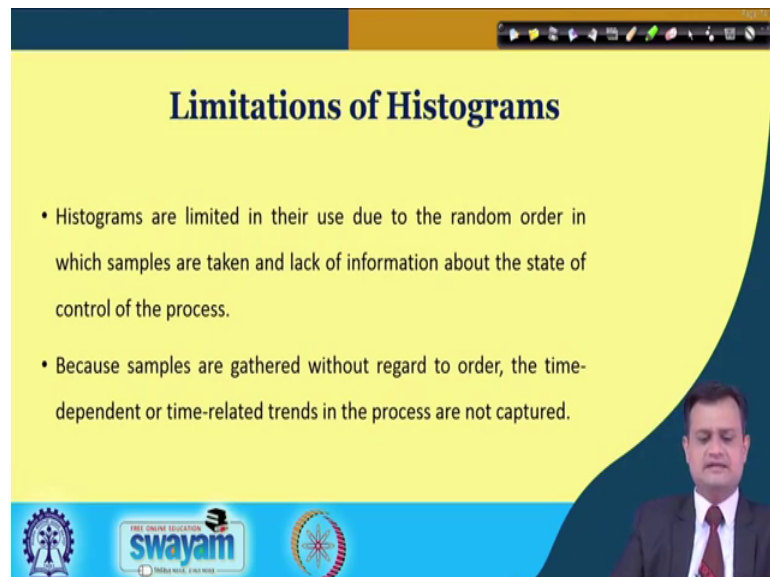

**Interpretations**

- **How wide is the histogram?** Looking at histogram width defines the variability of the process about the aim.
- **What is the shape of the histogram?** Remember that the data is expected to form a normal or bell-shaped curve. Any significant change or anomaly usually indicates that there is something going on in the process, which is causing the quality problem.

The slide features a yellow background with a dark blue wavy border on the right. At the bottom, there are logos for 'swayam' and 'INDIA WIDE, 24x7 WIDE' along with a small video inset of a man in a suit.

So, if my assumption about the normality is not valid, then my majority of the model rather regression, my statistical analysis or my control chart everything based on the normality assumption and if it is not valid then my analysis will lead to the wrong conclusions.

(Refer Slide Time: 15:07)

**Limitations of Histograms**

- Histograms are limited in their use due to the random order in which samples are taken and lack of information about the state of control of the process.
- Because samples are gathered without regard to order, the time-dependent or time-related trends in the process are not captured.

The slide features a yellow background with a dark blue wavy border on the right. At the bottom, there are logos for 'swayam' and 'INDIA WIDE, 24x7 WIDE' along with a small video inset of a man in a suit.

There are certain limitations that you cannot do inferential statistics; obviously, you will just get a bird's eye view that, what is happening how my data is spreaded or is queued.

(Refer Slide Time: 15:19)

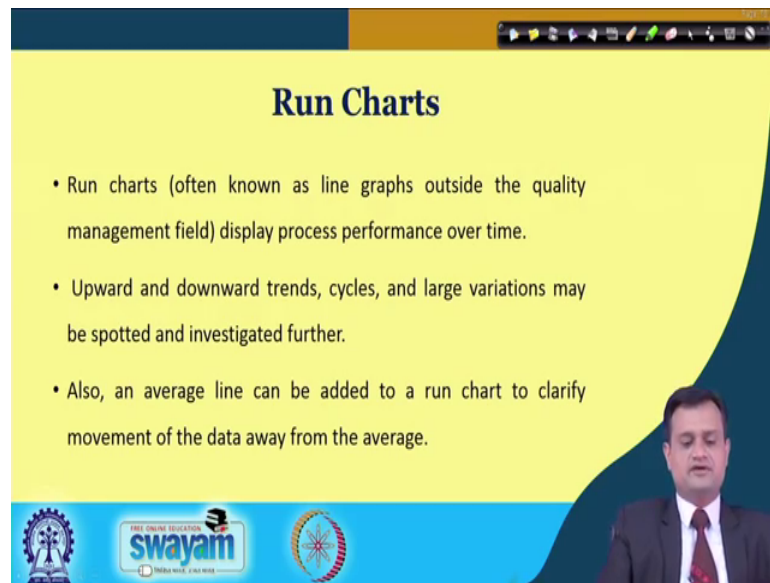

This is the run chart and you can say that, let us say this is the month, January, February, March, April and so on, and this is the run chart for customer complaints. So, these are basically the customer complaint.

What does it tell? It is a simple representation that there are 4 customer complaints in January, there are 3, there are 6, there are 5, 5, 8, 2, 3 and again 3 and this is 4. So, it is a very simple visual representation that helps me to understand that, how my customer complaints are changing, whether a particular month here is really of importance or critical. For example, the maximum number of complain you receive in June.

Now you can investigate that whether my people were on leave or my sales representative or if it is a case of restaurant, waiters were different or some other reason for prevailing or there was a heavy rush. So, you can figure out that why the number of customer complaints were more. So, just gives you that how your data is placed with respect to a time window and you can analyse with respect to say previous or succeeding data.

(Refer Slide Time: 16:51)

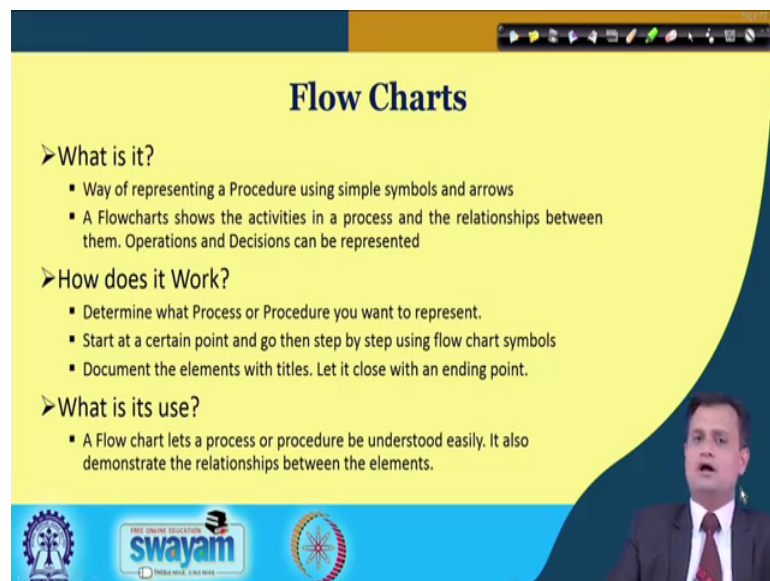

**Run Charts**

- Run charts (often known as line graphs outside the quality management field) display process performance over time.
- Upward and downward trends, cycles, and large variations may be spotted and investigated further.
- Also, an average line can be added to a run chart to clarify movement of the data away from the average.

The slide features a yellow background with a dark blue wavy border on the right. At the bottom, there are logos for 'swayam' and 'INDIA WISE, FUTURE WISE' along with a small video inset of a man in a suit.

So, this is my run chart and displays the process performance over a period of time.

(Refer Slide Time: 16:57)

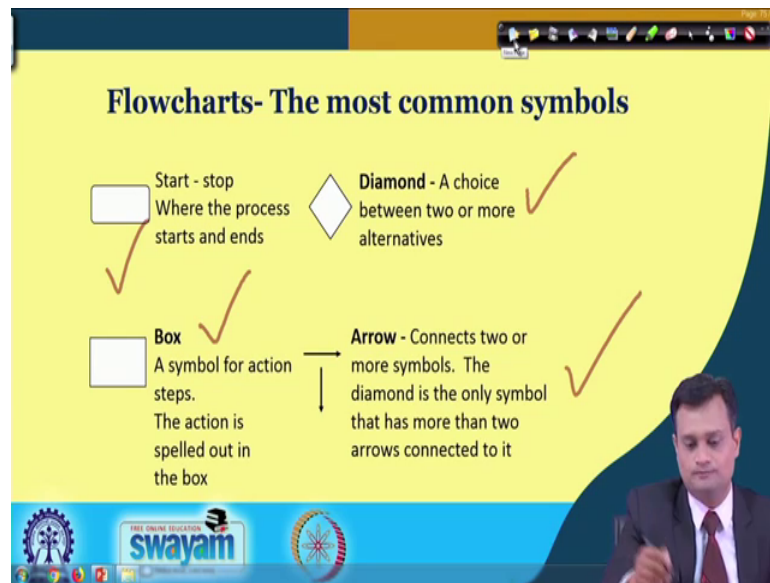

**Flow Charts**

- What is it?
  - Way of representing a Procedure using simple symbols and arrows
  - A Flowcharts shows the activities in a process and the relationships between them. Operations and Decisions can be represented
- How does it Work?
  - Determine what Process or Procedure you want to represent.
  - Start at a certain point and go then step by step using flow chart symbols
  - Document the elements with titles. Let it close with an ending point.
- What is its use?
  - A Flow chart lets a process or procedure be understood easily. It also demonstrate the relationships between the elements.

The slide features a yellow background with a dark blue wavy border on the right. At the bottom, there are logos for 'swayam' and 'INDIA WISE, FUTURE WISE' along with a small video inset of a man in a suit.

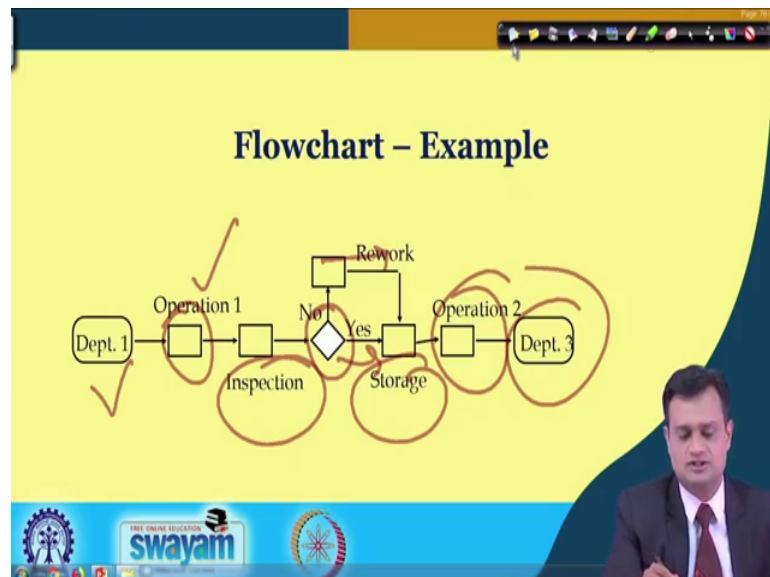

You have another tool which you have used right from your schooling that is the flowchart and typically it helps me to map the process, define the important junctures of my process and also the decision points.

(Refer Slide Time: 17:11)

So typically, if you want to indicate the start and stop, then this is the symbol you use if you want to say action, so, some processing is going on or something is happening then it is a box, then diamond it is about choice, decision making, arrow it connects the various symbols and shows the flow.

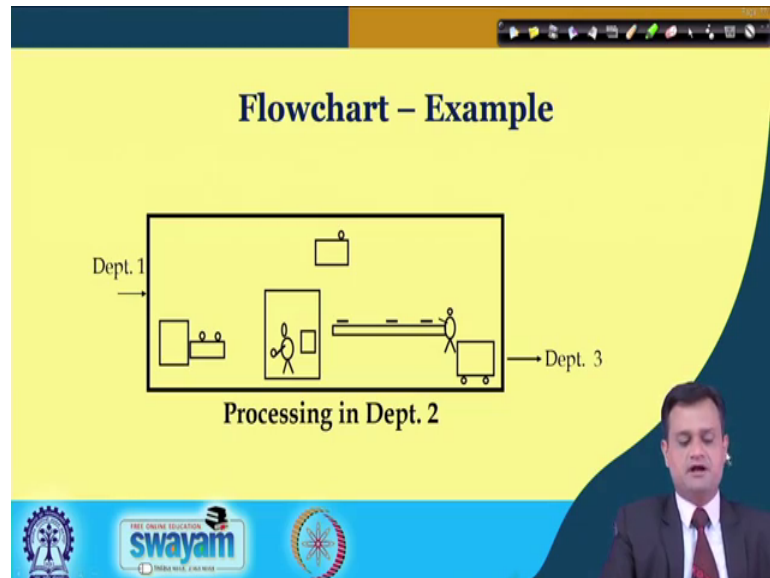

(Refer Slide Time: 17:39)

So, this is what is my flowchart and you can just see the example flowchart, there is a department 1 and there is operation 1 so, I have used this. There is inspection something is happening, so, box. This is on point no or yes, whether you have to go for rework or

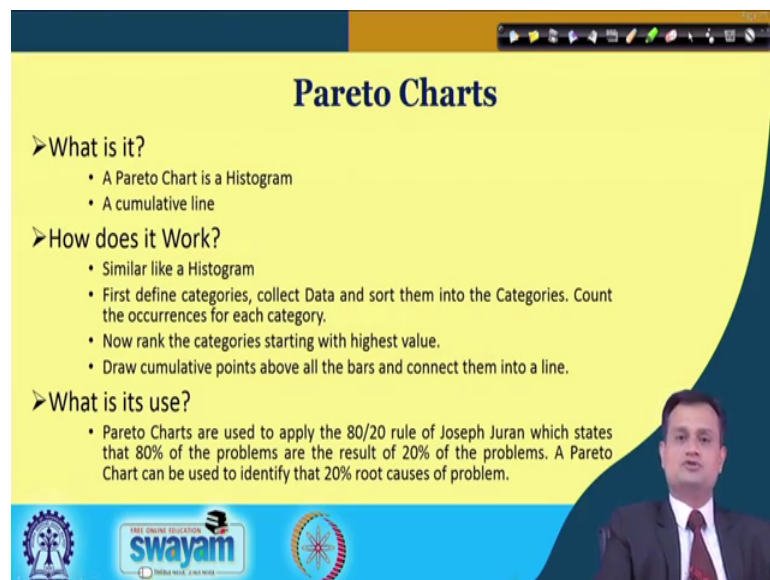

you will pass it, storage, operation and then it will go to department 3. So, this is a very very simple understanding of my flowchart.

(Refer Slide Time: 18:09)

And processing in department 2 can even be captured through a systematic flowchart.

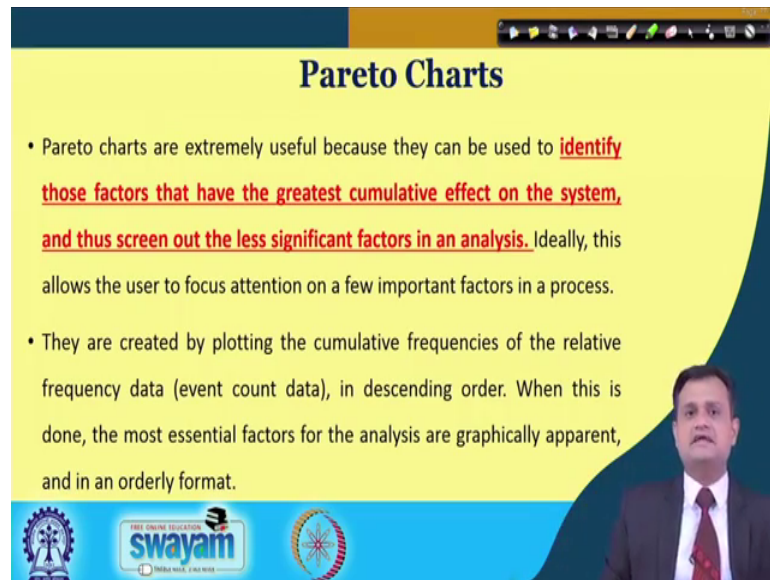

(Refer Slide Time: 18:11)

And that will give the people workers a very simple and easy way to understand that how the things are streamlined. Now, Pareto chart as we have learnt that it follows the 80-20 rule, and a renowned economist Pareto, gave this particular logic and he realised that 80 percent of the wealth of the world is in the hand of 20 percent of the people and only 20

percent is available for the 80 percent. So, he came to a conclusion that there is no point in focusing on all the problems if you can figure out vital few, then the 20 percent can really cause the 80 percent of the problem and rest 80 percent are only responsible for the 20 percent of the problem.

(Refer Slide Time: 19:05)

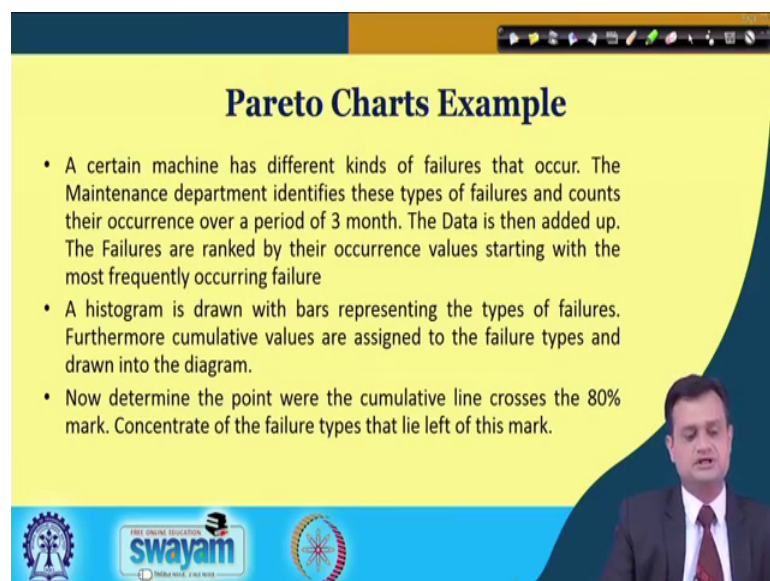

**Pareto Charts**

- Pareto charts are extremely useful because they can be used to identify those factors that have the greatest cumulative effect on the system, and thus screen out the less significant factors in an analysis. Ideally, this allows the user to focus attention on a few important factors in a process.
- They are created by plotting the cumulative frequencies of the relative frequency data (event count data), in descending order. When this is done, the most essential factors for the analysis are graphically apparent, and in an orderly format.

The slide features a yellow background with a blue header and footer. The footer contains logos for 'swayam' and 'INDIA RISE, CHINA RISE'.

So, this is what he has done and typically it identifies the factors that of the greatest cumulative effect on the system.

(Refer Slide Time: 19:13)

**Pareto Charts Example**

- A certain machine has different kinds of failures that occur. The Maintenance department identifies these types of failures and counts their occurrence over a period of 3 month. The Data is then added up. The Failures are ranked by their occurrence values starting with the most frequently occurring failure
- A histogram is drawn with bars representing the types of failures. Furthermore cumulative values are assigned to the failure types and drawn into the diagram.
- Now determine the point were the cumulative line crosses the 80% mark. Concentrate of the failure types that lie left of this mark.

The slide features a yellow background with a blue header and footer. The footer contains logos for 'swayam' and 'INDIA RISE, CHINA RISE'.

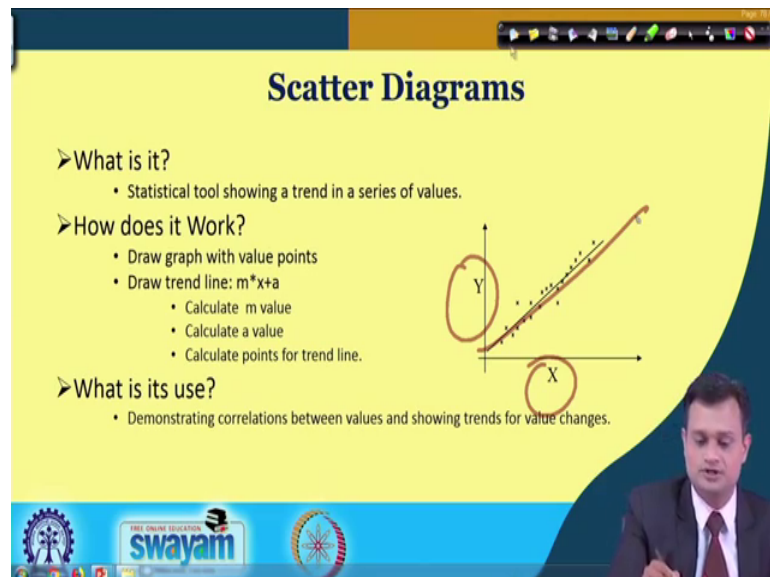

And I can represent my typical Pareto chart like this.

(Refer Slide Time: 19:15)

So, you have this data arranged in the descending order and then you find the cumulative frequency and then you try to see that at a particular 80 percent where it cuts. So, 80 percent say, it cuts at a particular point and all the problems below this are really of importance because they contribute to 80 percent and I will focus on these problems first.

(Refer Slide Time: 19:53)

So, this we have previously also seen with the example. The another is scatter plot and we had seen in correlation analysis also that there is some scatterness in the data and you try to capture this or you try to find out a best fit line or correlation.

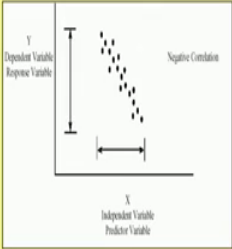

So, scattered plot basically says that, how my data is distributed, how my data is scattered with respect to maybe variable X and variable Y in the space and can I fit some best fit line,  $y$  is equal to  $mx$  plus  $a$ . So, this shows the trends over a period of time suppose it's a productivity and suppose X is the time and Y is my productivity then I can say that how my productivity is increasing with respect to time.

(Refer Slide Time: 20:45)

## Scatter Diagrams

**Interpretations**

- If the points cluster in a band running from lower left to upper right, there is a positive correlation (if  $x$  increases,  $y$  increases).
- If the points cluster in a band from upper left to lower right, there is a negative correlation (if  $x$  increases,  $y$  decreases).
- If it is hard to see where you would draw a line, and if the points show no significant clustering, there is probably no correlation.

So, this is about the scattered plot, you can refer couple of examples.

## Cause and Effect Diagrams

➤ What is it?

- It's a diagram that demonstrates the relationship between Effects and the categories of their causes
- The Arrangement of the Diagram lets it look like a fishbone it is therefor also called fish-bone diagram

➤ How does it Work?

- Determine the Effect or Problem you would like to examine
- Categorize the possible causes find subcategories
- Describe the possible causes

swayam

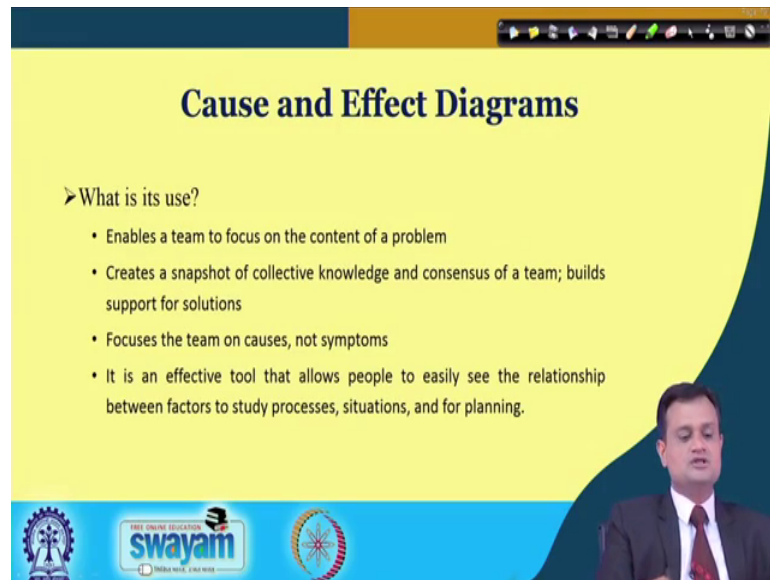

Cause and effect we all know that this is the most important approach for conducting the initial brainstorming exercise and identifying all the possible causes that can lead to a particular effect. So, it is also called (Refer Time: 21:06) diagram, fishbone diagram and cause and effect.

(Refer Slide Time: 21:09)

## Cause and Effect Diagrams

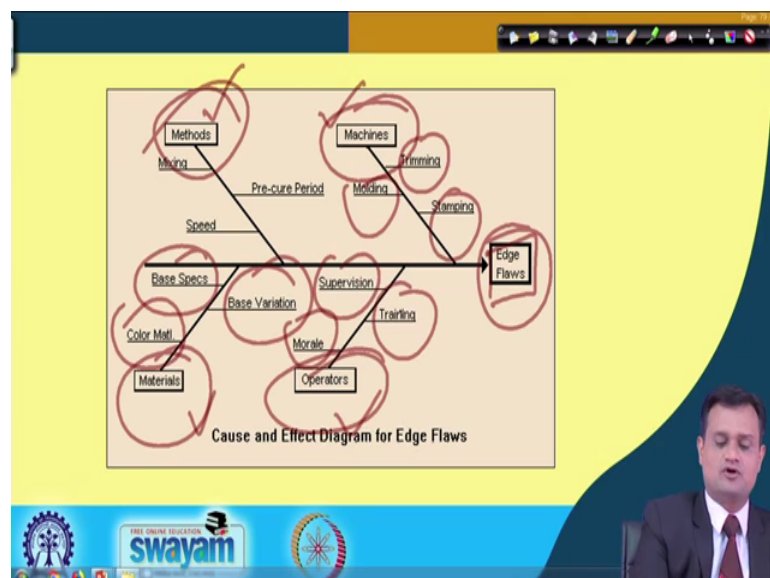

➤ What is its use?

- Enables a team to focus on the content of a problem
- Creates a snapshot of collective knowledge and consensus of a team; builds support for solutions
- Focuses the team on causes, not symptoms
- It is an effective tool that allows people to easily see the relationship between factors to study processes, situations, and for planning.

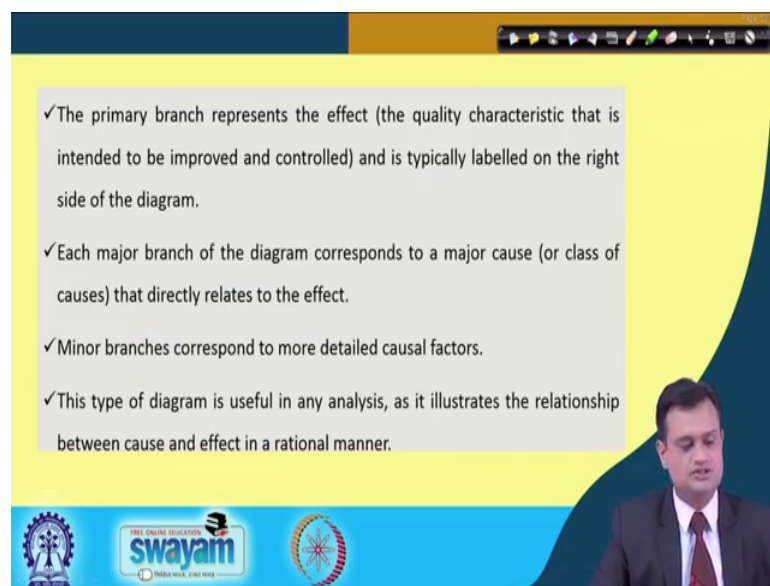

So typically, your cause and effect diagram enables the team to focus on content of the problem, find out the causes and symptoms and allows the people to easily see the relationship.

(Refer Slide Time: 21:21)

So, just see this there is a problem with the edge flows in manufacturing process, there could be machine related problem like timing, stamping, moulding, there could be operators training, supervision, moral, material, specification, colour of the material, base variation and there could be problem with the methods. So, you have the effect, you have the causes; causes are further separated as the main causes and within the main cause you have the branches which are your sub causes.

(Refer Slide Time: 21:55)

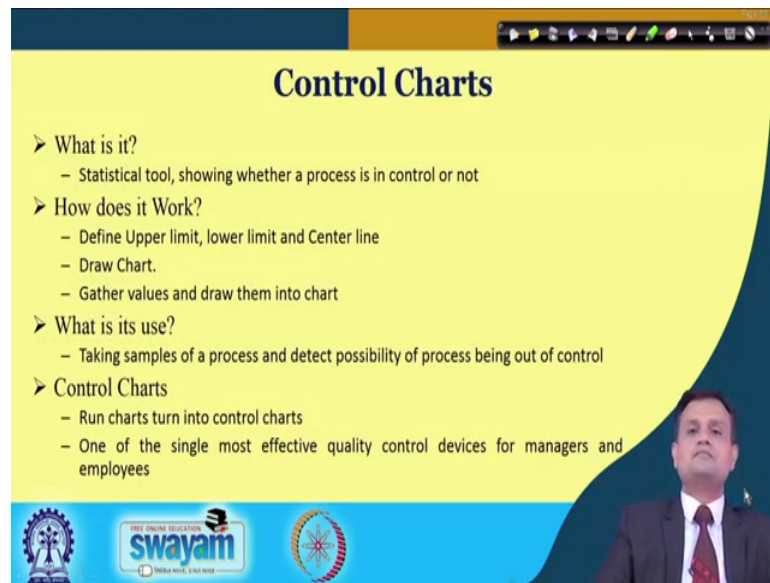

- ✓ The primary branch represents the effect (the quality characteristic that is intended to be improved and controlled) and is typically labelled on the right side of the diagram.
- ✓ Each major branch of the diagram corresponds to a major cause (or class of causes) that directly relates to the effect.
- ✓ Minor branches correspond to more detailed causal factors.
- ✓ This type of diagram is useful in any analysis, as it illustrates the relationship between cause and effect in a rational manner.

**Control Charts**

- What is it?
  - Statistical tool, showing whether a process is in control or not
- How does it Work?
  - Define Upper limit, lower limit and Center line
  - Draw Chart.
  - Gather values and draw them into chart
- What is its use?
  - Taking samples of a process and detect possibility of process being out of control
- Control Charts
  - Run charts turn into control charts
  - One of the single most effective quality control devices for managers and employees

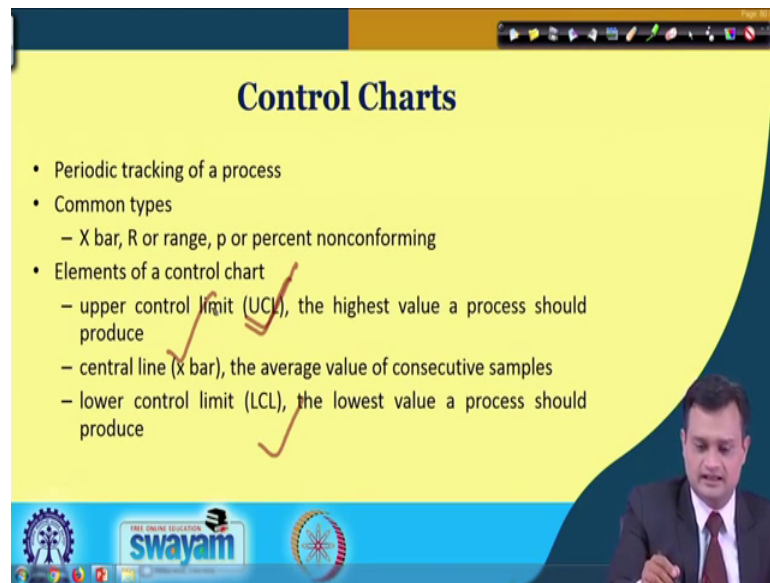

At the bottom of the slide, there is a blue banner with the Swayam logo and the text 'FREE ONLINE EDUCATION swayam'.

Now, coming to the last tool in my seven QC list; so, the 7th tool which is the most important and widely used tool on which we will devote couple of lectures in detail and that is the control chart. So, all other tool can also help you to control my quality or get hold on my problem, but control chart because they are statistically driven it is really a scientific tool to achieve better control on my processes and take the corrective action at the right time. So, it works with the upper limit, upper control limit, lower limit and central line and the moment you see that your point is going outside the control line just I am giving you a brief then there is an indication that something is going wrong and you may think about a corrective action.

(Refer Slide Time: 22:55)

### Control Charts

- Periodic tracking of a process
- Common types
  - $\bar{X}$  bar, R or range, p or percent nonconforming
- Elements of a control chart
  - upper control limit (UCL), the highest value a process should produce
  - central line ( $\bar{x}$  bar), the average value of consecutive samples
  - lower control limit (LCL), the lowest value a process should produce

So, there are different types of control charts for variables and attributes. For variables  $\bar{X}$  bar and R chart or  $\bar{X}$  bar and S chart or sigma chart for attributes you have p chart, you have c chart, you have np chart, you have u chart. So we will see, how to construct the control chart how to design them and what is the purpose of each particular chart in the subsequent lectures. And typically, it sets the lower control limit, upper control limit, lower control limit and central line. This remains same for all the control charts irrespective of their nature for attribute or variable and we can have the idea about the process control.

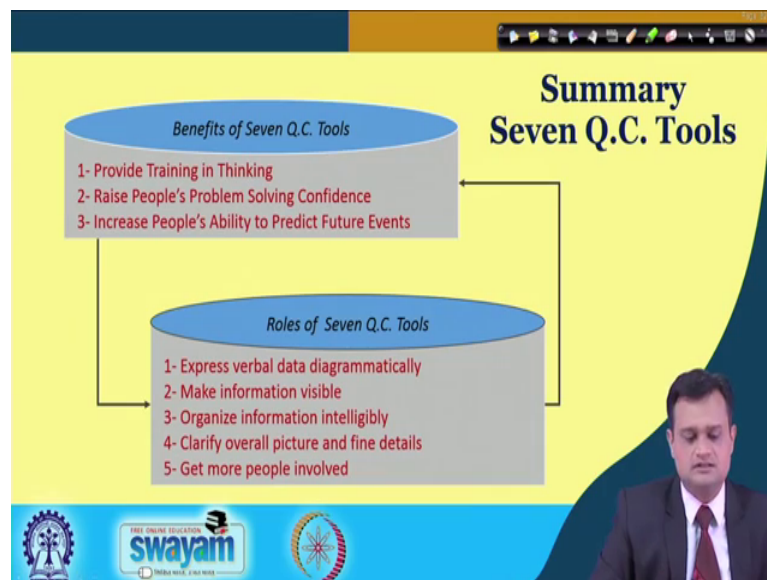

(Refer Slide Time: 23:41)

So, just see this that, this is my upper control limit, how to determine. We will see, lower control limit, you can see that up to this there is a stable process, these are some of the special causes. You may say that there is something unstable, but these are the common causes. So, whenever you see that the randomness is within these particular limits, this is just because of chance cause, random, common you cannot avoid it any process will have some variability. For example, if you measure your blood pressure in the morning maybe you get fantastic reading 110 and 80.

But, if you measure it in the afternoon it may be 120 and 80 or 85 and if you measure it in the evening when you are extremely tired it may be little higher 130 and 90. So, it is ok, it is all well within the range and it is acceptable. So, so long these variations are well within this limit, they are acceptable. There are some special cases when if some typical trend prevails, then that is an indication of some abnormality assignable cause that we will see in detail later on. But, just for the simplicity we assume that if the point is falling outside the control limit there is a concern and there could be an assignable cause prevailing if it is all within the control limit I need not to worry.

(Refer Slide Time: 25:25)

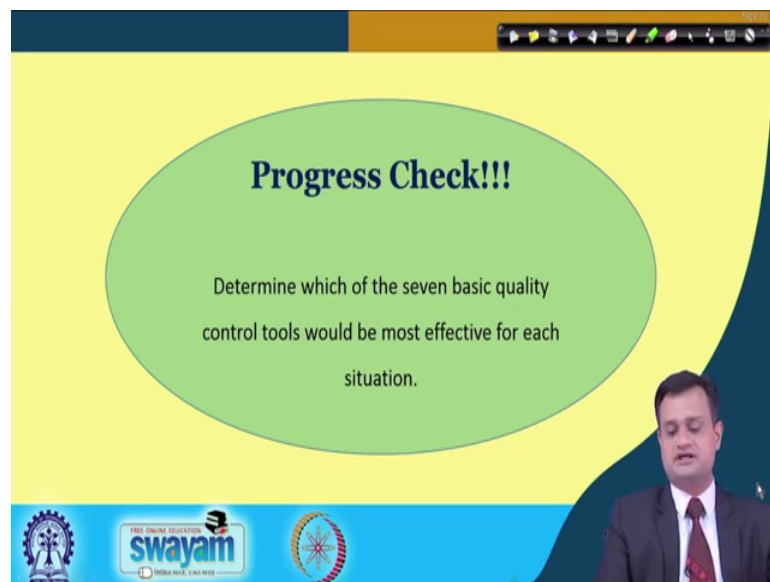

So, there are benefits of control QC tools, it provides training in thinking remember. When you execute this, it triggers your thinking how to think in a more scientific way, rigorous way, directional way, raise people's problem solving confidence. You stand with the data, you stand with the trend, you stand with the facts and then you have better

confidence in your results and recommendations and you can also convince the other people and top management. Increase people ability to predict future events. So, you are not only struggling with day to day life, but you can say that what will happen down the line.

So, you must have seen the insurance company they are asking that, are you a smoker, do you have diabetes, do you have blood pressure, do you have you gone through some critical surgery; if yes then you will find that they will raise the premium. Because they have some standardised table available that if you have this problem and if you are a smoker then what is the risk to your life and then they can better predict the consequences that may occur in the future.

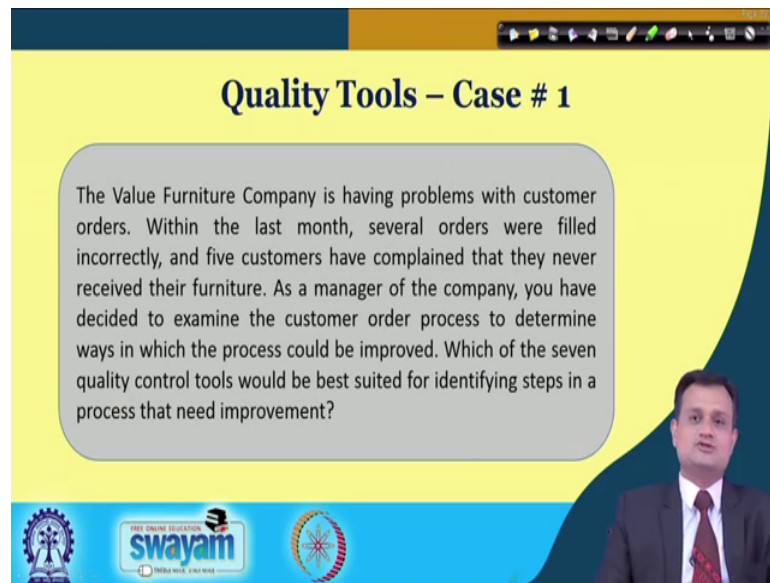

So, these are the couple of benefits of the seven QC tools and there are various roles seven QC tools that it express verbal data diagrammatically, information visible, organised information intelligibly and clarify overall picture and got get more people involved.

(Refer Slide Time: 26:59)

So, progress check determine which of the seven basic QC tool would be most effective for each situation. I want to put you in little bit thinking process.

**Quality Tools – Case # 1**

The Value Furniture Company is having problems with customer orders. Within the last month, several orders were filled incorrectly, and five customers have complained that they never received their furniture. As a manager of the company, you have decided to examine the customer order process to determine ways in which the process could be improved. Which of the seven quality control tools would be best suited for identifying steps in a process that need improvement?

swayam

Let us say this is case 1 and is like this. The value future company; furniture company is having problems with customer orders. Within the last month several orders where failed in correctly and five customers have complained that they never received that furniture. So, as a manager of the company you have decided to examine the customer order process to determine ways in which the process could be improved.

**Quality Tools – Case # 2**

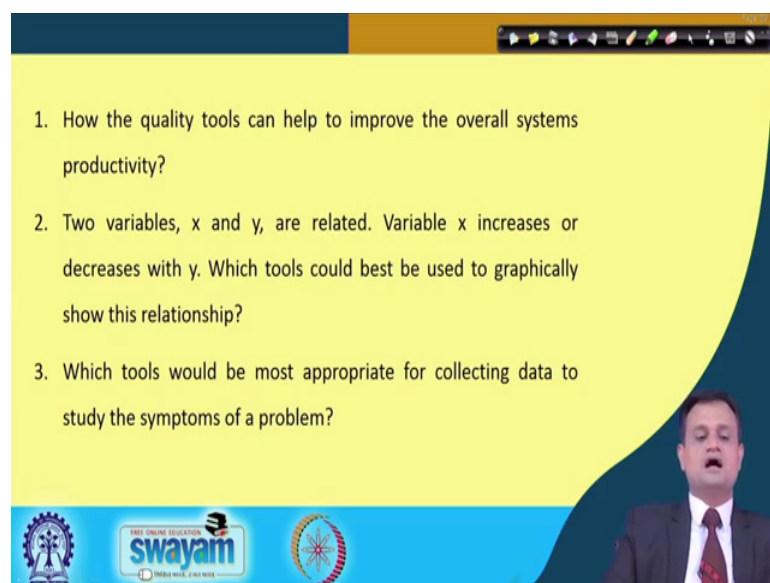

You are a new quality engineer for a machine parts distributor. Management tells you that the factory has not produced the normal amount of parts during the last past quarter. They would like for you to determine whether there is a specific problem causing the decreased numbers over the past quarter, or if the part-making process needs to be modified. You have access to past production data for use in your analysis. Which quality control tool would be ideal for this situation?

swayam

So, which of the seven QC tool would be most appropriate and what kind of steps would you like to follow to address this problem.

Let us see the case 2. You are a new quality engineer for a machine parts distribution and management tells you that the factory has not produce the normal amount of parts during the last say past quarter. So, they would like for you to determine whether there is a specific problem causing the decreased number of say over the past quarter production or if the part-making process needs to be say upgraded updated or modified. You have to access to pass production data for use in analysis, in your analysis and which quality control tool you would like to use to propose an amicable, reasonable practical solution to the management.

1. How the quality tools can help to improve the overall systems productivity?

2. Two variables,  $x$  and  $y$ , are related. Variable  $x$  increases or decreases with  $y$ . Which tools could best be used to graphically show this relationship?

3. Which tools would be most appropriate for collecting data to study the symptoms of a problem?

So, think it. How the quality tools can help to improve the overall systems productivity? Two variables  $x$  and  $y$  are related. Variable  $x$  increases or decreases with  $y$ . Which tool could be or tools could be based used to graphically show this relationship? Which tools would be most appropriate for collecting data to study the symptoms of the problem? So, just try to introspect and that would help you to digest the concepts better.

**Conclusion**

- ❖ Quality control tools are used to monitor the overall operation and continuous process improvement.
- ❖ The Seven Basic Tools of Quality is a designation given to a fixed set of graphical techniques identified as being most helpful in troubleshooting issues related to quality.

The slide features a dark blue background with the word 'Conclusion' in a large, yellow, cursive font. A yellow banner on the right contains two bullet points. At the bottom right, there is a small video feed of a man in a suit. The Swayam logo and 'FREE ONLINE EDUCATION' text are visible at the bottom center.

And quality control tools as I mentioned provide a directional way to attack on your problem and convince the people for your recommendations.

So, thank you very much for your interest in learning seven QC tools. I hope this video would have help you to appreciate the importance of these tools. We will do the detailed analysis and develop a greater understanding on various quality control charts in the subsequent lectures till that time keep revising be with me enjoy.
