Lecture – 49
SDE for Field Theory in Minkowski Space

Welcome back. So, in the last lecture we talked about the causality structure of the Feynman propagator in the Klein Gordon field and we also discussed the Schwinger Dyson equation. Let us quickly review the two problems and then we will move on to the path integral formulation for the fermions.

(Refer Slide Time: 00:50)

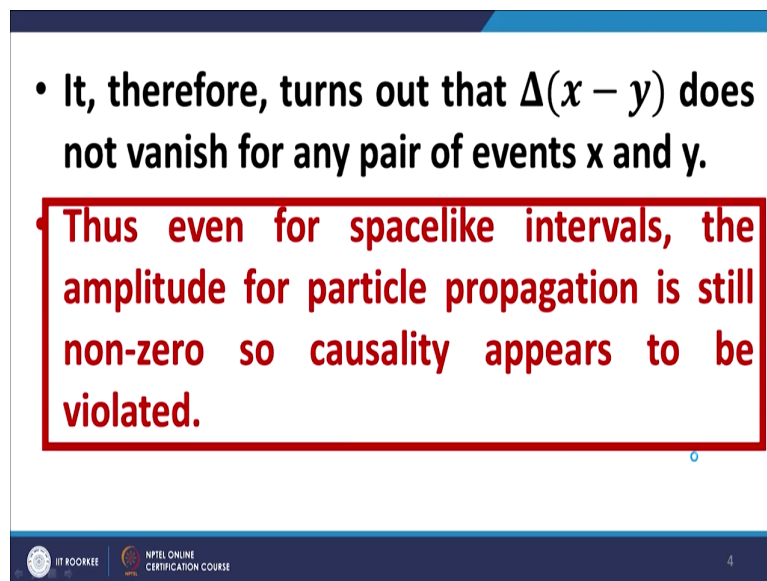

$$\begin{aligned}\Delta(x-y) &= \langle 0 | T \phi(x) \phi(y) | 0 \rangle \\ &= \frac{1}{(2\pi)^3} \int \frac{d^3k}{2\omega_k} e^{-ik(x-y)} \\ &\sim \exp(-imt) \text{ for timelike separated } x, y \\ &\sim \exp(-mr) \text{ for spacelike separated } x, y \\ &\neq 0 \text{ in both cases.}\end{aligned}$$

So, the causality for the Feynman propagator what we did was; we obtained the expression for the time order product in terms of the Feynman propagator and we found that the behaviour of the propagator approximated that the behaviour of an exponential minus m r, it

approximated the behaviour of exponential minus $m r$ for space like separation between x and y .

It was clear that the propagator does not vanish in both cases the propagator has a nonzero value in both cases, even at even for space like separations between x and y .

(Refer Slide Time: 01:36)

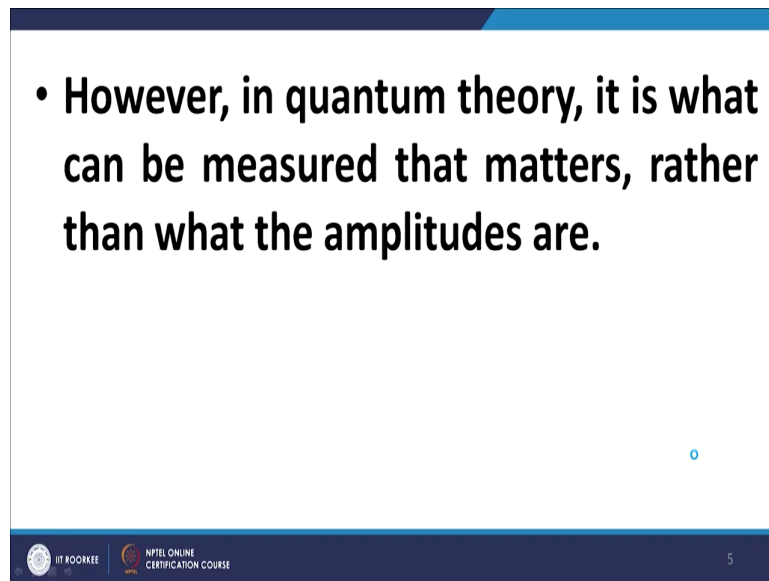

• It, therefore, turns out that $\Delta(x - y)$ does not vanish for any pair of events x and y .

• Thus even for spacelike intervals, the amplitude for particle propagation is still non-zero so causality appears to be violated.

IT KOOKEE NPTEL ONLINE CERTIFICATION COURSE 4

So, this was an apparent violation of causality. We decided to investigate it further and for that purpose we obtained the commutators between the field operators at the points x and y .

(Refer Slide Time: 01:40)

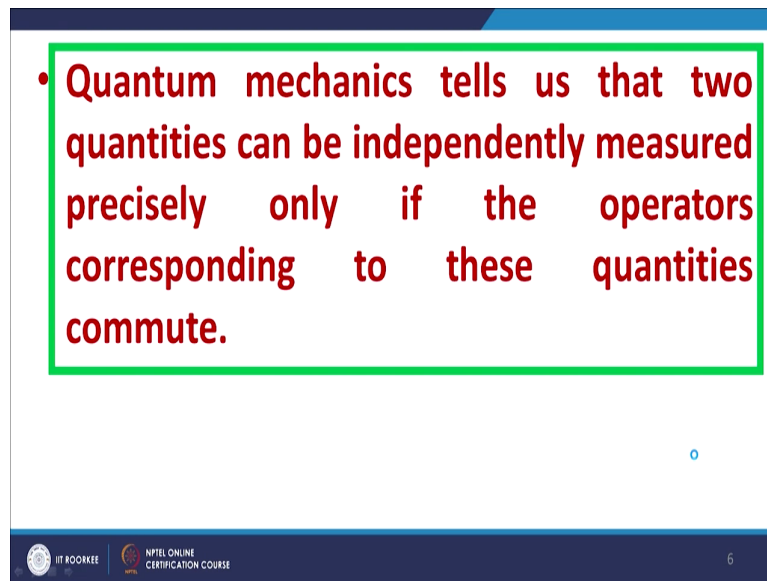

- **However, in quantum theory, it is what can be measured that matters, rather than what the amplitudes are.**

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 5

So, because in essence the in the context of quantum theory, it is not, it is the quantities that are can be measured, the attributes that can be measured that that matter rather than what the amplitudes are, the amplitudes can afford to be nonzero provided, the measurement is compatible with the causality structure.

(Refer Slide Time: 02:15)

- Quantum mechanics tells us that two quantities can be independently measured precisely only if the operators corresponding to these quantities commute.

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 6

So, that is what we proceeded to investigate by obtaining the commutators of the field operators at the points x and y and what did we find? Let us see.

(Refer Slide Time: 02:23)

The commutators of field operators give :

$$[\varphi(x), \varphi(y)] = \Delta(x-y) - \Delta(y-x)$$

$\neq 0$ for timelike separated x, y

$= 0$ for spacelike separated x, y

 IIT ROORKEE  NPTEL ONLINE CERTIFICATION COURSE 8

What we found was that the commutators between x and y for time like separations does not vanish; however, when we worked out the commutator between $\varphi(x)$ and $\varphi(y)$ for space like separation we found that it vanishes. The fact that in the is the commutator between this field operator that x and y for space like separation vanishes implies what? It implies that simultaneous measurements at the points of the field operators at the point x and point y can be made and; that means, in other words the measurement at one point does not influence or cannot influence the measurement at the other point provided the two points are space like separated and that incidentally is compatible with the causality structure that we end which is to proof.

So, at the end of the day what we conclude is that the quantum structure or the field structure presented through the Feynman propagators or the path integral formalism is compatible, at

least for the Klein Gordon field is compatible with the causality structure and we searched in special directivity.

(Refer Slide Time: 03:48)

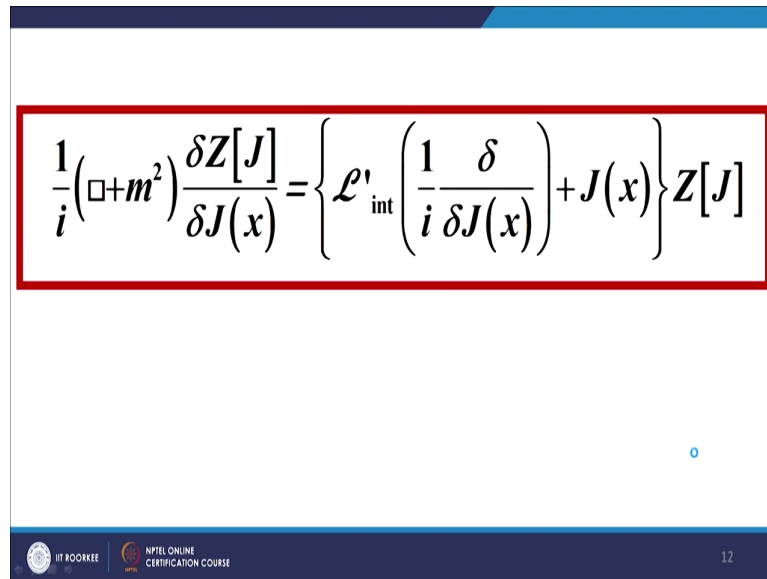

(Refer Slide Time: 03:54)

Now, then thereafter, we started talking about the interacting field and we obtained the expression for the generating functional for the full green functions of the of $Z J$ and for the interacting field interacting Klein Gordon field.

(Refer Slide Time: 04:06)

$$\frac{1}{i}(\square+m^2)\frac{\delta Z[J]}{\delta J(x)} = \left\{ \mathcal{L}'_{\text{int}}\left(\frac{1}{i}\frac{\delta}{\delta J(x)}\right) + J(x) \right\} Z[J]$$

And then we obtained certain the certain properties of this Z J the one of the first property that we obtained is given in the red box here.

(Refer Slide Time: 04:19)

FOR THE FREE FIELD THE FOLLOWING EQ

$$\frac{1}{i}(\square+m^2)\frac{\delta Z[J]}{\delta J(x)} = \left\{ \mathcal{L}'_{\text{int}}\left(\frac{1}{i}\frac{\delta}{\delta J(x)}\right) + J(x) \right\} Z[J]$$

HAS THE SOLUTION :

$$Z_0[J] = \exp\left[\frac{i}{2}\int d^4x d^4x' J(x)\Delta_F(x-x')J(x')\right]$$

 IIT ROORKEE  NPTEL ONLINE CERTIFICATION COURSE 13

At the and the second property is given here for this is for the free field; for the free field, we have the solution for the generating functional for the full green functions given in the green box at the bottom of your slide.

(Refer Slide Time: 04:33)

FOR THE INTERACTING FIELD, THE EQUATION :

$$\frac{1}{i}(\square+m^2)\frac{\delta Z[J]}{\delta J(x)} = \left\{ \mathcal{L}'_{\text{int}}\left(\frac{1}{i}\frac{\delta}{\delta J(x)}\right) + J(x) \right\} Z[J]$$

HAS THE SOLUTION :

$$Z(J) = \mathcal{N} \exp \left[i \int d^4x \mathcal{L}'_{\text{int}}\left(\frac{1}{i}\frac{\delta}{\delta J(x)}\right) \right] Z_0(J)$$

  NPTEL ONLINE CERTIFICATION COURSE

14

And for the interacting field the solution takes the form which is given in the green box in this particular slide at the bottom. And thereafter we moved on to the Schwinger Dyson equations.

(Refer Slide Time: 04:42)

The slide features a white background with a dark blue header and footer. The title "SCHWINGER DYSON EQUATIONS" is centered in a large, bold, black font. A small blue circle is located in the lower right quadrant of the slide area. The footer contains the IIT Roorkee logo on the left, the NPTEL Online Certification Course logo in the center, and the number "15" on the right.

SCHWINGER DYSON EQUATIONS

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 15

(Refer Slide Time: 04:48)

THE ACTION OF THE FIELD

$$S[\varphi] = \int dx \left(\varphi (-\partial^2 + m^2) \varphi + \frac{\lambda_4}{4!} \varphi^4 \right)$$

◦

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 16

We first defined various terms to recapitulate we define the action of the 5 to the power 4 field as the expression that is given in the red box in this slide in terms of the field variable.

Now, the important thing before we go further I emphasize the fact that these fields that appear in the action here and that will subsequently appear in the generating functional as well are c numbers or classical numbers they are not operators. That is an important thing and therefore, the action is a function of functions and that is what is called a functional.

(Refer Slide Time: 05:26)

GENERATING FUNCTIONAL

$$Z[J] = \int D[\varphi] \exp \left[-S[\varphi] + \int dx \varphi(x) J(x) \right]$$
$$= \exp \{ W[J] \}$$

◦

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 17

The generating functional as I was just mentioning a moment back is given by this expression again this all these phi's appearing here or field or classical variables and they may be functions, they may be numbers, but they are not quantum operators.

That is an important point that will arise in due course when we talk more about the in Dirac fields. And $W[J]$ is the exponent, is the logarithm of the generating functional for the full green functions and $W[J]$ represents the generating function for the connected green functions and we can represent $W[J]$ as the logarithm of $Z[J]$.

(Refer Slide Time: 06:19)

EFFECTIVE ACTION

- The effective action is a Legendre transform of $W[J]$ with respect to the source.

$$\Gamma[\Phi] = -W[J] + \int dx \Phi(x) J(x)$$

- It generates the one-particle irreducible (1PI) Green functions.

IT ROKKEE NPTEL ONLINE CERTIFICATION COURSE 19

The effective action; the effective action is defined as the Legendre transform of $W[J]$ with respect to the source J and it is given by the expression that is here in the red box, in the middle of your slide and it generates the one particle irreducible representation or irreducible green functions.

So, we have $Z[J]$ which represents or which is the generating function for the full green functions, we have $W[J]$ which is the generating function for the connected green functions and then we have $\Gamma[\Phi]$ the effective action which is the generating function for the one particle irreducible represent irreducible green functions of the theory. Field functions as derivative of $W[J]$ this is the definition in fact of the field function.

(Refer Slide Time: 07:08)

FIELD FUNCTION AS DERIVATIVE OF $W[J]$

$$\Phi(x) := \frac{\delta W[J]}{\delta J(x)} = \frac{1}{Z[J]} Z'[J] = \langle \varphi(x) \rangle_J$$
$$= \frac{1}{Z[J]} \int D[\varphi] \varphi(x) \exp \left\{ -S[\varphi] + \int dy \varphi(y) J(y) \right\}$$

 IIT ROORKEE  NPTEL ONLINE CERTIFICATION COURSE 20

The field function is the functional derivative of the of $W J$. What is $W J$? $W J$ is the generating function for the connected green functions and this incidentally works out to the average value of the field operator in the presence of sources.

(Refer Slide Time: 07:34)

CURRENT AS DERIVATIVE OF EFFECTIVE ACTION

- The current, on the other hand, can be expressed as the derivative of the effective action:

$$J(x) = \frac{\delta \Gamma[\Phi]}{\delta \Phi(x)}.$$

o

 IIT ROORKEE  NPTEL ONLINE CERTIFICATION COURSE 21

And the current can be represented as a derivative as the functional derivative of the effective action. This also follows directly from the definition of the effective action.

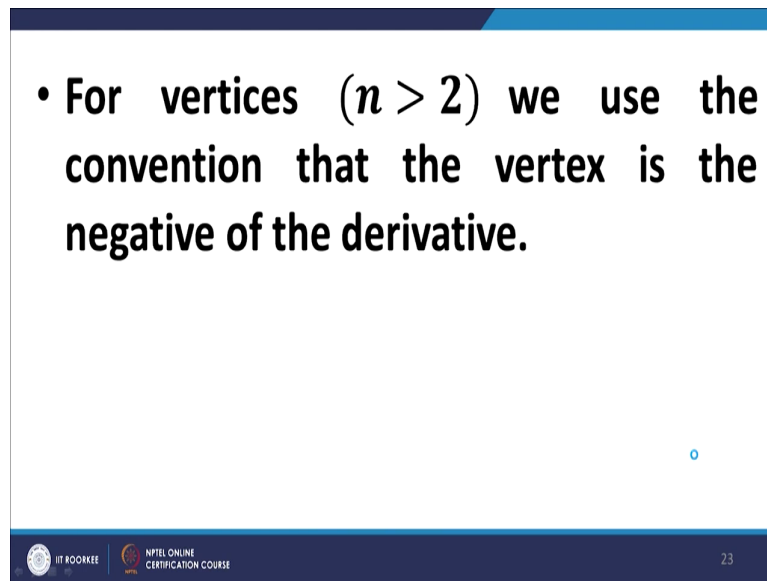

(Refer Slide Time: 07:45)

- The n-point functions are computed from the n-th derivative of the effective action.

$$\Gamma(x_1, \dots, x_n)^J := -\frac{\delta^n \Gamma[\Phi]}{\delta\Phi(x_1) \cdots \delta\Phi(x_n)}, n > 2.$$

The n point functions are computed from the n th derivative of the effective action. These are the vertices in the presence of sources without J Jth Schwing set equal to 0 without J Jth Schwing set equal to 0 and these are given by the various n point various n th functional derivatives of the effective actions with respect to the various phi phi 1 phi 2 and phi n, where phi is are the are the in the field functions.

(Refer Slide Time: 08:17)

- For vertices ($n > 2$) we use the convention that the vertex is the negative of the derivative.

And importantly, we use the convention that the vertex is the negative of the derivative that is in to facilitate the compatibility or convenience of the science. We do not have to change it the plus minus again and again. As you also see in the example that follows this exposition.

(Refer Slide Time: 08:36)

- The $\Gamma(x_1, \dots, x_n)^J$ are not yet the physical n-point functions of the theory.
- They still contain external sources J as indicated by the superscript J .
- We set $J = 0$ to get physical propagators $D(x - y)$ and vertices $\Gamma(x_1, \dots, x_n)$

$$D(x - y) := D(x, y)^{J=0},$$
$$\Gamma(x_1, \dots, x_n) := \Gamma(x_1, \dots, x_n)^{J=0}.$$

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 24

The this is a very important slide, if you see when we have the superscript J and in fact, the expressions that we have obtained here in the previous slide the expressions for the vertices that we have obtained here and the expressions for the propagators also that we obtained in the similar manner are still not the physical propagators, they are propagators where J is not yet set to 0.

In order to obtain the physical propagators here we need to set J equal to 0 after doing all the calculations, after working out the derivatives we get functions of J and then in those functions of J we put J equal to 0 and the expressions that we then get are the physical propagators and the physical vertices and the function $D(x - y)$.

(Refer Slide Time: 09:23)

- The function $D(x, y)$, being the inverse of the two-point function, is given by

$$D(x, y) := \frac{\delta^2 W[J]}{\delta J(x) \delta J(y)} = \left(\frac{\delta^2 \Gamma[\Phi]}{\delta \Phi(x) \delta \Phi(y)} \right)^{-1}$$

Now, this is in presence of J , please note that this is still not without J Schwing set equal to 0 is given by the expression in the red box here. It immediately follows from the definition of the field function ϕ ; field function ϕ is the functional derivative of $W[J]$ with respect to J x differentiating it again will give me the propagated $D(x, y)$ with J not yet set equal to 0 and then we said J equal to 0 and we arrive at the expression for the physical propagator.

(Refer Slide Time: 10:04)

DERIVATION

- For the derivation of SDEs we start with the integral of a total derivative, which vanishes:

IIT ROORKEE

NPTEL ONLINE
CERTIFICATION COURSE

27

(Refer Slide Time: 10:09)

$$\begin{aligned}
 0 &= \int D[\varphi] \frac{\delta}{\delta \varphi} \exp\left\{-S + \int dy \varphi(y) J(y)\right\} \\
 &= \int D[\varphi] \left(-\frac{\delta S}{\delta \varphi(x)} + J(x) \right) \exp\left\{-S + \int dy \varphi(y) J(y)\right\} \\
 &= \left(-\frac{\delta S}{\delta \varphi(x)} \Big|_{\varphi(x') = \delta / \delta J(x')} + J(x) \right) Z[J] = 0.
 \end{aligned}$$

Now, we look at briefly go back to the derivation recap the derivation of Schwinger Dyson equation, this forms the cornerstone of the theory. So, just let us quickly recap this. We start with the; we start with the total integral of a total derivative which vanishes, because of the surface terms not contributing to the integral. And therefore, the integral as a whole vanishes and we get the expression that is there in the red box at the top of few slide.

When we do the; when we do the functional differentiation we extract the term that is given in the round brackets and the rest of the term remains at as it is. And if we set now, comes the important point the, now at this point, at the point when we are in the blue box the expression that is in the curly, in the round brackets it is the function of y x the field variables. And the integration is also with respect to the path integration with respect to the field variable so; obviously, we cannot take this expression outside the integral.

However, we note the fact that if we substitute the functional derivative δ by δJ_x instead of ϕ_x , we delta first functional derivative of J_x acting on what is to the right pulls back a factor of ϕ into this integral. So, we can in a sense we can replace this ϕ_x here with ϕ_x equal to δ upon δJ_x .

The two will do an equivalent job and now, this expression within the round brackets becomes independent of ϕ and therefore, we can pull it outside the integral. This trick has been employed several times in the previous exposition and we can take it outside the bracket and what we are left with now is nothing, but $Z J$. So, in the ultimate when we do all this maneuvers, what we end up is the expression that is given in the green box at the bottom of your slide.

ϕ_x is replaced by δ the functional derivative with respect to J_x , because it pulls down ϕ from when it acts on $Z J$, when this δ upon δJ_x the functional derivative with respect to J_x and $Z J$, it pulls down a ϕ and so it is equivalent to the term within the round brackets and the blue box and, but would being independent of ϕ now, this can be pulled outside the integral and we have $Z J$ as the integral and this expression in the round bracket goes outside the integral.

(Refer Slide Time: 13:04)

DSE FOR CONNECTED FUNCTIONS

- We now substitute $Z[J]$ with $e^{W[J]}$

29

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE

For the connected green functions with substitute $Z[J]$ by $e^{W[J]}$; as I mentioned the generating function for the connected green function is the logarithm of the generating function for the full green functions at J .

(Refer Slide Time: 13:22)

$$\begin{aligned} \text{We use : } & e^{-W[J]} \left(\frac{\delta}{\delta J(x)} \right) \left(e^{W[J]} f \right) \\ &= e^{-W[J]} \left[e^{W[J]} \frac{\delta W[J]}{\delta J(x)} + e^{W[J]} \frac{\delta}{\delta J(x)} \right] f \\ &= \left\{ \frac{\delta W[J]}{\delta J(x)} + \frac{\delta}{\delta J(x)} \right\} f. \end{aligned}$$

And we use the this property which is given in the red box at the top of the slide if you walk through this it is quite elementary, quite straightforward, simple functional differentiation here. And, when we do the functional differentiation of the product e to the power $W J$ into an arbitrary function f what we find is that the expression, the expression when operating on f gives rise to the expression within the curly brackets operating on f .

So, we have e to the power minus $W J$ functional derivative with respect to $J x$, e to the power $W J$ is equal to the expression that is given in the green box right at the bottom of your slide.

(Refer Slide Time: 14:08)

$$F / A: \left(-\frac{\delta S}{\delta \varphi(x)} \Big|_{\varphi(x')=\delta/\delta J(x')} + J(x) \right) Z[J] = 0$$
$$e^{-W[J]} \left(-\frac{\delta S}{\delta \varphi(x)} \Big|_{\varphi(x')=\delta/\delta J(x')} + J(x) \right) e^{W[J]} = 0$$

We write the our Schwinger Dyson equation that we are obtained earlier, for $Z[J]$ e to the power minus $W[J]$ on one side and e to the power $W[J]$ on the other side.

(Refer Slide Time: 14:28)

The slide contains the following mathematical expressions:

Top red box:
$$F/A: e^{-W[J]} \left(\left. \frac{\delta S}{\delta \varphi(x)} \right|_{\varphi(x') = \delta / \delta J(x')} + J(x) \right) e^{W[J]} = 0$$

Middle blue box:
$$\text{We use } e^{-W[J]} \left(\frac{\delta}{\delta J(x)} \right) e^{W[J]} = \frac{\delta W[J]}{\delta J(x)} + \frac{\delta}{\delta J(x)}$$

Bottom green box:
$$\left. \frac{\delta S}{\delta \varphi(x)} \right|_{\varphi(x') = \frac{\delta W[J]}{\delta J(x')} + \frac{\delta}{\delta J(x')}} + J(x) = 0$$

Page footer: IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 32

When this x on the functional derivative with respect to $J(x)$ what we make use of the expression that is in the previous slide, which is here and we can write it in this form which is given here in the green box right at the bottom of your slide. So, let us try to understand this a bit more carefully.

If you look at this expression and the expression in the top red box it is the functional derivative of S with respect to $\varphi(x)$ and then $\varphi(x)$ been replaced by $\delta / \delta J(x')$. So, in other words S is a functional of $\varphi(x)$. We do the functional derivative, S is a functional of $\varphi(x)$, we take its functional derivative with respect to $\varphi(x)$ which will again be a functional of $\varphi(x)$ and then we substitute instead of $\varphi(x)$ in that functional in the derivative we substitute this as $\delta / \delta J(x)$.

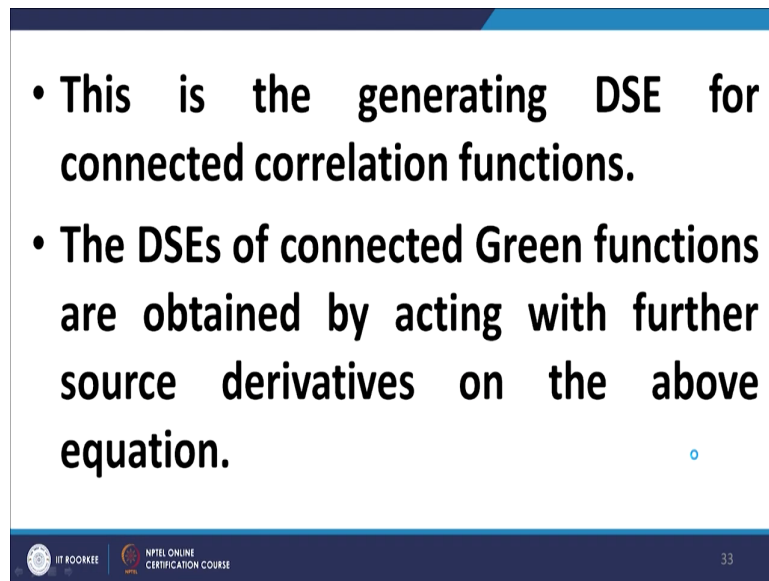

So, what we will get is essentially a functional of δJ_x and δ upon δJ_x we will get here when we replace ϕ_x in the derivative of the action by δ upon δJ_x . Now, each δ upon δJ_x is when they are acted upon the two sides on the left hand side by e to the power minus W_J and acted upon on the right hand side by e to the power W_J , will return quantities or will return expressions that are given in the blue box in the second, in the blue box in the middle of the slide.

And we in other words what will happen is when each term which has this factor here, in the expression which is given in the upper curly bracket, red box curly bracket is acted on by e to the power minus J and e to the power plus W_J we will get a factor which is on the right hand side of this in the blue box instead of δ upon δJ_x

In other words, everywhere δ upon δJ_x will be replaced by this expression on the right hand side and that is precisely what is happening here and that is what is shown in the green box and the bottom of the slide. So, this is the; this is the expression that we have for the Schwinger Dyson equation for W_J .

(Refer Slide Time: 17:06)

- This is the generating DSE for connected correlation functions.
- The DSEs of connected Green functions are obtained by acting with further source derivatives on the above equation.

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 33

And this is that what is W_J ? Remember, W_J is the generating function for the connected green functions connected correlation functions.

(Refer Slide Time: 17:18)

EFFECTIVE ACTION

- To get the 1PI functions we perform the Legendre transformation of $W[J]$ with respect to the source J .
- Thereby $\delta W[J]/\delta J(x)$ changes to $\Phi(x)$ and $\delta/\delta J(x)$ to $\int dz D(x,z)^J \frac{\delta}{\delta \Phi_j(z)}$

◦

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 34

Now, we work out the effective action recall $\delta W[J]$ upon $\delta J(x)$ is nothing, but the is nothing, but the field function.

(Refer Slide Time: 17:28)

$$\Phi(x) := \frac{\delta W[J]}{\delta J(x)} = \frac{1}{Z[J]} Z'[J] = \langle \varphi(x) \rangle_J$$

$$= \frac{1}{Z[J]} \int D[\varphi] \varphi(x) \exp \left\{ -S[\varphi] + \int dy \varphi(y) J(y) \right\}$$

This is in fact, the definition of the field function and as far as the second part is concerned and let us go back a minute. See there are two terms here, in the subscript in delta and the functional derivative of $W[J]$ with respect to $J(x)$ that is one term that that becomes $\Phi(x)$ and the second term will come back to the functional derivative with respect to $J(x)$.

Let us go, let us now address this particular term the first term is straightforward $\delta W[J]$ upon $\delta J(x)$ is by definition $\Phi(x)$ Φ capital Phi extract the field function.

(Refer Slide Time: 18:10)

$$\frac{\delta}{\delta J(x)} = \int dz \frac{\delta \Phi(z)}{\delta J(x)} \frac{\delta}{\delta \Phi(z)}$$

$$= \int dz \frac{\delta}{\delta J(x)} \frac{\delta W[J]}{\delta J(z)} \frac{\delta}{\delta \Phi(z)}$$

$$= \int dz \frac{\delta^2 W[J]}{\delta J(x) \delta J(z)} \frac{\delta}{\delta \Phi(z)} = \int dz D(x,z)^J \frac{\delta}{\delta \Phi_j(z)}.$$

Yes, now about the second term, if you look at the second term if you look at this derivation its quite straightforward and we what we end up with is the expression that is given the right hand side on in the green box where we have simply use nothing, but the definitions; we have written the functional derivative with respect to J x as the functional derivative with respect to phi z and thereafter we have defined phi z in terms of W J upon delta J z that is phi z that appears in the numerator here.

Delta upon delta J x is carried forward to the blue box unchanged, phi z is written as delta W J upon delta J z that is by definition of the field function and the third term is also unchanged. So that, leads us to the left hand side of the expression in the green box and if we can identify the second derivative W J with respect to J x and j z as nothing but, the propagator x, z in the presence of sources.

(Refer Slide Time: 19:22)

$$\frac{\delta S}{\delta \varphi(x)} \Big|_{\varphi(x') = \Phi(x') + \int dz D(x', z)^J \delta / \delta \Phi(z)} + \frac{\delta \Gamma[\Phi]}{\delta \Phi(x)} = 0,$$

All DSEs for 1PI Green functions can be derived from it by further differentiations with respect to the fields.

37

Therefore, we make these substitutions we make the, let us go back again. Yes, in this expression as I mentioned the first term becomes the field function the second the expression for the second term we also arrived at in terms of the propagator and as the expression in the right hand side of the green box of this slide.

This particular slide and we make both these substitutions in the expression for the $W(z)$ and we arrive at the expression for the effective action as the expression that is given here in the red box. So, this is the effective action and this gives us the generating function for the 1 pi green functions or the irreducible green functions for the theory.

(Refer Slide Time: 20:19)

Now, we take on this example, example of what we have discussed. So, far let us illustrate it with the example of the phi 4 field.

(Refer Slide Time: 20:27)

$$S[\varphi] = \frac{1}{2} \int dx dy S^{(2)}(x, y) \varphi(x) \varphi(y)$$
$$- \frac{1}{4!} \int dx dy dz du S^{(4)}(x, y, z, u) \varphi(x) \varphi(y) \varphi(z) \varphi(u)$$

The minus signs follow from the convention for vertices.

NPTEL ONLINE
CERTIFICATION COURSE

39

We will quickly run through it. The action is defined by the expression that is in the red and green box. The expression in the red box is the bare action and the expression in the green box represents the interaction term. So, this is straightforward.

(Refer Slide Time: 20:45)

- The bare two-point function is given by

$$S^{(2)}(x, y) = \frac{\delta^2 S}{\delta \varphi(x) \delta \varphi(y)} \Big|_{\varphi=0}$$

$$= \delta(x - y) (-\partial^2 + m^2)$$

And, the bare two point function is given by the second derivative of the for second functional derivative of the action with respect to x and with respect to y and then putting ϕ equal to 0 and that gives us the expression when we introduce the Klein Gordon free field operator that is given by the expression given in the green box at the bottom of the slide.

(Refer Slide Time: 21:11)

- and the bare vertices by

$$S^{(4)}(x, y, z, u)$$
$$= - \frac{\delta^4 S}{\delta \varphi(x) \delta \varphi(y) \delta \varphi(z) \delta \varphi(u)} \Big|_{\varphi=0}$$
$$= \lambda_4 \delta(x-y) \delta(x-z) \delta(x-u).$$

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 41

And the bare vertices, if you work out the bare vertices the expression that you get is again at the bottom of the slide in the green box. It comprises of three delta functions delta x minus y delta x minus z delta x minus u multiplied by lambda 4 which is the coupling constant.

(Refer Slide Time: 21:32)

• For the effective action, we have:

$$\frac{\delta S}{\delta \varphi(x)} \Big|_{\varphi(x') = \Phi(x') + \int dz D(x', z)' \delta / \delta \Phi(z)}$$

$$= \left(\begin{array}{l} \int du S^{(2)}(x, u) \varphi(u) \\ - \frac{1}{3!} \int dudvdw S^{(4)}(x, u, v, w) \varphi(u) \varphi(v) \varphi(w) \end{array} \right) \Big|_{\varphi(x') = \Phi(x') + \int dz D(x', z)' \delta / \delta \Phi(z)}$$

NPTEL ONLINE CERTIFICATION COURSE 42

Now, we come to the effective action the expression for the Schwinger Dyson equation for the effective action as I mentioned just few minutes back is the expression that is given in the red box here, expressed in terms of, explicitly in terms of the action that we are considering for the phi 4 field, it takes the form that is given in the green box. And, the first term is the bare action term and the second term represents, the first term represents the derivative of the bare action term and the second term represents the derivative of the interaction term functional derivative.

And now, we have to make the substitution. In this expression we need to make the substitutions given by the suffix here, right at the bottom of right hand corner of the slide we have to make the substitutions for the field variables in terms of the effective action and the propagators and that is what we do in the next slide.

(Refer Slide Time: 22:32)

$$\begin{aligned}
 &= \int du S^{(2)}(x, u) \Phi(u) - \\
 &\quad \int dudvdw S^{(4)}(x, u, v, w) \times \\
 &\quad - \frac{1}{3!} \left(\Phi(u) + \int dz D(u, z)^J \delta / \delta \Phi(z) \right) \times \\
 &\quad \left(\Phi(v) + \int dy D(v, y)^J \delta / \delta \Phi(y) \right) \Phi(w)
 \end{aligned}$$

And in that is precisely what is done here, we have substituted the expressions here $\phi(x)$ equal to capital $\phi(x)$ plus integral of the propagator times the delta upon the functional derivative with respect to the capital $\phi(z)$ we are substituted this expression for $\phi(x)$. Wherever it occurs in the green box here and we get the expression that is here in the green box.

(Refer Slide Time: 23:08)

- The derivatives act on field and propagators as follows:

$$\frac{\delta}{\delta\Phi(y)}\Phi(x) = \delta(x-y)$$

Now, the derivatives this they act on the propagators and the field functions and the propagators their action on the field functions and the propagators is given in terms of the following for the field in the functional derivative with respect to the field function of another field function yields delta function that is straightforward. I repeat the and the functional derivative of capital Phi x the field function at x with respect to the field function at phi yields the Dirac delta function.

(Refer Slide Time: 23:50)

$$\frac{\delta}{\delta\Phi(x)} D(y,z)^J = \frac{\delta}{\delta\Phi(x)} \left(\frac{\delta^2\Gamma[\Phi]}{\delta\Phi(y)\delta\Phi(z)} \right)^{-1}$$

$$= - \int dz_1 dz_2 \left(\frac{\delta^2\Gamma[\Phi]}{\delta\Phi(y)\delta\Phi(z_1)} \right)^{-1} \left(\frac{\delta^3\Gamma[\Phi]}{\delta\Phi(z_1)\delta\Phi(x)\delta\Phi(z_2)} \right) \left(\frac{\delta^2\Gamma[\Phi]}{\delta\Phi(z_2)\delta\Phi(z)} \right)^{-1}$$

$$= \int dz_1 dz_2 D(y,z_1)^J \Gamma(z_1,x,z_2)^J D(z_2,z)^J$$

And the functional derivative with respect to x of the propagator y, z in the presence of sources of J is slightly more complex. It gives us the expression which when simplified yields the expression which is at the bottom of the slide in the green box here, which consists of the two propagators and the vertex.

(Refer Slide Time: 24:18)

- This relation follows from the matrix relation:

$$\delta (MM^{-1}) = \mathbf{0}$$

$$\Rightarrow \delta M^{-1} = -M^{-1}(\delta M)M^{-1}$$

And in arriving in the second step, in from moving from the red box to the blue box expression; from the expression in the red box to the expression in the blue box we have used this property delta for vertices, for matrices, I am sorry for matrices; delta M M inverse is equal to 0 if this implies delta m inverse is equal to minus M inverse delta M M inverse.

This is the property that we have used in arriving at the previous slide which you can see here in this blue box we have this is M inverse, this is delta M and the first term is M inverse, the second term is delta M and the third term is again M inverse.

(Refer Slide Time: 25:08)

$$\begin{aligned} & \frac{\delta}{\delta \Phi(x)} \Gamma(y_1, \dots, y_n)^J \\ &= \frac{\delta \Gamma[\Phi]}{\delta \Phi(x) \delta \Phi(y_1) \dots \delta \Phi(y_n)} \\ &= \Gamma(x, y_1, \dots, y_n)^J \end{aligned}$$

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 47

As far as the action of the functional derivatives of the with respect to the field functions on the vertices the if you, if this field functions act on, if this field in the functional derivatives with respect to the field function act on an n point vertex we get an n plus 1 point vertex by the functional differentiation.

(Refer Slide Time: 25:35)

- For completeness the derivative of an n-point function was included.

◦

(Refer Slide Time: 25:37)

• Using the above relations, we can write:

$$\frac{\delta S}{\delta \varphi(x)} \Big|_{\varphi(x')=\Phi(x')+\int dz D(x',z)^J \delta/\delta \Phi(z)}$$

$$= \int du S^{(2)}(x,u) \Phi(u) - \frac{1}{3!} \int dudvdw S^{(4)}(x,u,v,w) \left(\Phi(u)\Phi(v)\Phi(w) + 3\Phi(u)D(v,w)^J + \left[+ \int dz D(u,z)^J \int dv_1 dv_2 D(v,v_1)^J \Gamma(v_1,z,v_2)^J D(v_2,w)^J \right] \right)$$

So, these are the properties and using this or this results we can write down the functional derivative of our action. The action that we have assumed the phi 4 action in terms of the expression, that is given in the green box at the bottom of your slide. The expression is; obviously, quite involved what I will do is; I will elaborate this computation of this expression in the notes that I will provide together with this set of lectures.

So, you can have access to that and stepwise computation of the various, particularly in the in this particular lecture there are lot of extensive calculations which are difficult to explain on the power point. So, I will put it in the notes and provide them together with the with this lectures and the power points.

(Refer Slide Time: 26:43)

- where the symmetry of the $S^{(i)}$ under exchange of their arguments was used.
- Now we can derive the DSE for the two-point function by plugging this into

$$\left. \frac{\delta S}{\delta \varphi(x)} \right|_{\varphi(x')=\Phi(x')+\int dz D(x',z) \delta/\delta\Phi(z)} + \frac{\delta \Gamma[\Phi]}{\delta \Phi(x)} = 0,$$

- and differentiating with respect to $\Phi(y)$:

So, having worked out the first term here in the red box; having worked out the first term here in the red box, we can now work out this Schwinger Dyson equation for the field function and that takes the form which is in the full expression takes the form given in the red box. The expression for the effective action here is the is there and therefore, we can work out the effective action from this particular expression and by differentiating this step by step we can arrive at various two point functions.

(Refer Slide Time: 27:20)

$$\begin{aligned}
 \Gamma(x, y) = & S^{(2)}(x, y) - \\
 & -\frac{1}{2} \int du dv S^{(4)}(x, y, u, v) \Phi(u) \Phi(v) - \frac{1}{2} \int du dv S^{(4)}(x, y, u, v) D(u, v)' - \\
 & -\frac{1}{2} \int du dv dw S^{(4)}(x, u, v, w) \Phi(u) \int dv_1 dv_2 D(v, v_1)' \Gamma(v_1, z, v_2)' D(v_2, w)' - \\
 & -\frac{1}{3!} \int du dv dw S^{(4)}(x, u, v, w) \int dz D(u, z)' \int dv_1 dv_2 D(v, v_1)' \Gamma(y, v_1, z, v_2)' D(v_2, w)' - \\
 & -\frac{1}{2} \int du dv dw S^{(4)}(x, u, v, w) \int dz dz_1 dz_2 D(u, z_1)' \Gamma(z_1, y, z_2)' D(z_2, z)' \times \\
 & \times \int dv_1 dv_2 D(v, v_1)' \Gamma(v_1, z, v_2)' D(v_2, w)'.
 \end{aligned}$$

This is given here; an example of two point functions is given here in this particular computation. As you see this is in this left hand side expression we have already obtained. The right hand side expression is also can be obtained straight away, because we the gamma phi is nothing, but the effective action. So, and gamma phi upon this delta phi x is nothing, but J.

So, we can obtain this expression which is here in the red box and by differentiating this with respect to phi y. We need to write J in terms of this expression in terms of the effective action, because the differentiation is to be done with respect to capital phi y and therefore, we need to represent J as the function of phi y and that is precisely what is done in this equation using the effective action and on taking various derivatives, further derivatives we can arrive at two point functions and so on.

(Refer Slide Time: 28:28)

- **We can set the sources to zero and the second term vanishes.**

o

(Refer Slide Time: 28:33)

So, this is an example this is an illustration of how the process operates for the simple to point, simple case of the ϕ^4 field, in the context of the Klein Gordon field. After the break we will start the Fermi Dirac field and obtain the propagator for the Fermi Dirac field using the path integral formalism.

Thank you.
