**Countably Additive Set Functions on Intervals**

Welcome to lecture 7 on measure and integration.

(Refer Slide Time: 00:30)

If you recall, in the previous lecture we had started looking at countably additive set functions on intervals and we proved some properties of such countably additive set functions. We will recall that theorem that we were proving and then continue the proof. If time permits, we will look at a characterization of countably additive set functions defined on algebras in the latter part of the lecture.

(Refer Slide Time: 00:59)

Countably additive set functions on intervals

- Let  $\mu : \tilde{\mathcal{I}} \rightarrow [0, \infty]$  be a finitely additive set function such that  $\mu(a, b] < +\infty$  for every  $a, b \in \mathbb{R}$ .
- Then there exists a monotonically increasing function  $F : \mathbb{R} \rightarrow \mathbb{R}$  such that
$$\mu(a, b] = F(b) - F(a) \quad \forall a, b \in \mathbb{R}.$$

If  $\mu$  is also countably additive, then  $F$  can be selected to be right-continuous.

 NPTEL

© Under K. Sreenivas Reddy - p.313

Let us just recall what we were proving in the last lecture. We were trying to show that if  $\mu$  is a finitely additive set function defined on the collection of all left-open right-closed intervals which was denoted by  $\tilde{\mathcal{I}}$ , if such a finitely additive set function is given with a property that  $\mu$  of any finite interval is finite,  $\mu$  of left-open right-closed interval  $a, b$  is finite for every  $a$  and  $b$ ; then, we wanted to characterize such countably additive properties of such functions and relate it to a class of functions on the real line.

The claim of the theorem is that there exists a monotonically increasing function  $F$  from  $\mathbb{R}$  to  $\mathbb{R}$  such that the value  $\mu$  of the left-open right-closed interval  $a, b$  is given by  $F$  of  $b$  minus  $F$  of  $a$  for every  $a$  and  $b$  belonging to  $\mathbb{R}$ . We wanted to show that given a finitely additive set function on the class of all left-open right-closed intervals, it must arise from a monotonically increasing right-continuous function  $F$  with the relation that the value  $\mu$  of  $a, b$  is given by the difference  $F$  of  $b$  minus  $F$  of  $a$ . Here,  $\mu$  was only finitely additive. If we assume  $\mu$  is countably additive, then this function  $F$  can be selected to be right-continuous.

(Refer Slide Time: 02:44)

Countably additive set functions on intervals

- Define  $F$  as follows:

$$F(x) := \begin{cases} \mu(0, x] & \text{if } x > 0, \\ 0 & \text{if } x = 0, \\ -\mu(x, 0] & \text{if } x < 0. \end{cases}$$

- We proved:  $F$  is monotonically increasing.
- We were proving: if  $\mu$  is also countably additive, then  $F$  is right continuous at every  $x \in \mathbb{R}$ .

NPTEL

©2006 K. Sreenivas (T. Sundararajan) - p.413

Let us just recall how we defined this function. We looked at the function  $F$  defined by  $F$  at a point  $x$  is defined as the measure  $\mu$  of the interval  $0$  to  $x$  if  $x$  is bigger than  $0$ ; it is  $0$  if  $x$  is equal to  $0$  and is minus  $\mu$  of  $x$  to  $0$ , closed at  $0$  if  $x$  is less than  $0$ . This was the definition of the function  $F$ . We proved the property that this function  $F$  is indeed monotonically increasing. For that, if you recall, we use the fact that  **$F$  is the measure  $\mu$  this  $\mu$  is a countably additive is a finitely additive set function**. Next, if we assume that  $\mu$  is countably additive, we wanted to show that this function  $F$  is right-continuous at every point  $x$  in  $\mathbb{R}$ .

(Refer Slide Time: 03:45)

Countably additive set functions on intervals

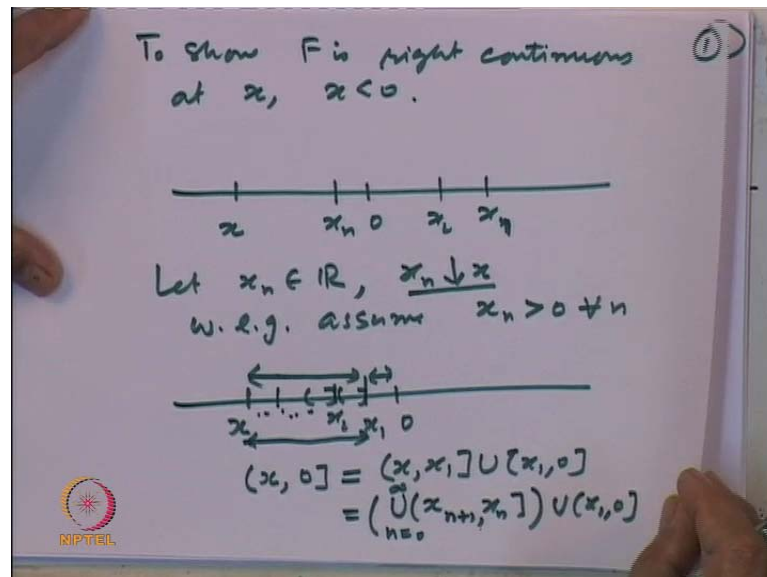

- We proved it when  $x \geq 0$ .

NPTEL

©2006 K. Sreenivas (T. Sundararajan) - p.413

We had started looking at the proof when  $x$  is bigger than or equal to 0. We had proved that for any point  $x$  bigger than or equal to 0,  $F$  is right-continuous at the point  $x$  is equal to 0. Today, we will start with proving the remaining part of the proof – if  $x$  is less than 0, then also  $F$  is right-continuous at  $x$ .

(Refer Slide Time: 04:13)

Let us look at the proof. We want to show  $F$  is right-continuous at a point  $x$  where  $x$  is less than 0. Here is the point 0 and here is  $x$ . To show right-continuity at the point  $x$ , let  $x_n$  belong to  $\mathbb{R}$ . Let us take  $x_n$  – a sequence in  $\mathbb{R}$  such that  $x_n$  decreases to  $x$ ; that means all the  $x_n$ s are on the right side of the  $x$  and are converging to  $x$ . All the points  $x_n$ s are on the right side and so here it may be  $x_1$ , here it may be  $x_2$  and so on (Refer Slide Time: 05:07).

After some stage,  $x_n$  has to cross over the point 0 (the value 0). What we are saying is this: without loss of generality, assume that all the  $x_n$ s are bigger than 0 for every  $n$  because  $x_n$  is going to converge to  $x$  and  $x$  is less than 0; so, at some stage it has to cross over. We can start analyzing the sequence from that point onwards. One writes this as without loss of generality the proof is not changed if we assume  $x_n$  is less than 0 for every  $n$ . Here is the situation; here is the point  $x$ , here is the point 0 and here is the point  $x_1$  (Refer Slide Time: 05:53).

Here is  $x_2$  and so on. Let us observe that the interval left-open right-closed at 0 can be written as  $x$  to  $x_1$  union  $x_1$  to 0. I can write this as from this point to  $x_1$  and from this

point onwards this one (Refer Slide Time: 06:24). Now, this interval  $x$  to  $x_1$  I am going to split further into a union of intervals. My claim is that this  $x$  to  $x_1$  is the same as  $x_1$  to  $x_2$  union  $x_2$  to  $x_3$  union  $x_3$  to  $x_4$  and so on.

The claim is that is the same as  $x_{n+1}$  comma  $x_n$  left-open right-closed union  $n$  equal to 0 to infinity union  $x_1$ , 0. The interval  $x$  to  $x_1$  – this part (Refer Slide Time: 07:09) we are splitting it into left-open right-closed, left-open right-closed and so on; this is an equality because  $x_n$  is decreasing to  $x$ . At any point here if I take any point in between  $x$  and  $x_1$ , then that stage has to be crossed over by some  $x_n$ ; that point will belong here. So, the interval  $x$  to  $x_1$  is a union of the intervals left-open  $x_{n+1}$  to closed  $x_n$ ,  $n$  equal to 0 to infinity.

(Refer Slide Time: 07:58)

The whiteboard shows the following derivation:

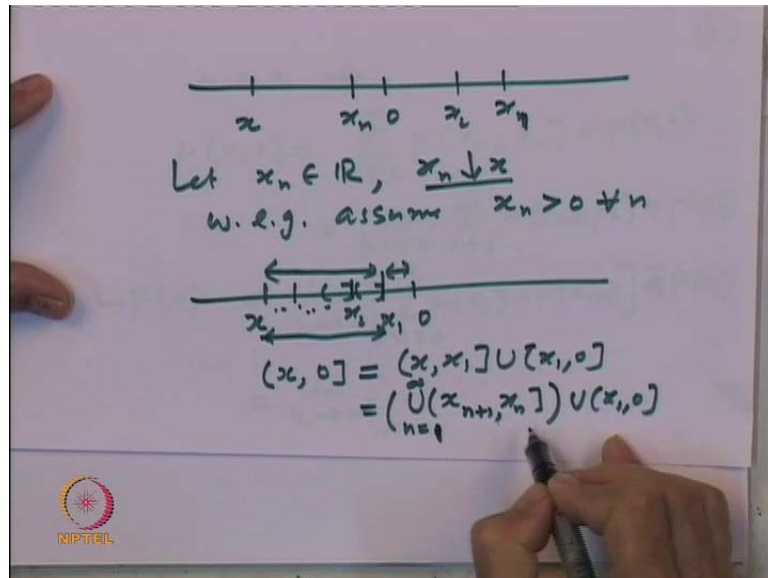

$$\begin{aligned} \mu.c.a. &\Rightarrow \\ \mu(x, 0] &= \sum_{n=0}^{\infty} \mu(x_{n+1}, x_n] + \mu(x_1, 0] \\ &= \lim_{k \rightarrow \infty} \sum_{n=0}^k \mu(x_{n+1}, x_n] + \mu(x_1, 0] \\ -F(x) &= \lim_{k \rightarrow \infty} \left[ \sum_{n=0}^k F(x_n) - F(x_{n+1}) \right] + F(x_1) \\ &= \lim_{k \rightarrow \infty} \left[ \right. \end{aligned}$$

Also observe that these intervals are all disjoint. These are all disjoint intervals; so, I can write using countable additive property  $\mu$  of the set function is equal to summation  $n$  equal to 0 to infinity  $\mu$  of  $x_{n+1}$ ,  $x_n$  plus  $\mu$  of  $x_1$  to 0. Here, we have used the fact that  $\mu$  countably additive implies this property is true. Now, this right-hand side is a sequence of nonnegative real numbers, possibly extended real numbers; I can write this as limit  $k$  going to infinity sigma  $n$  equal to 0 to  $k$   $\mu$  of  $x_{n+1}$ ,  $x_n$  plus  $\mu$  of  $x_1$  to 0, closed here at 0.

Now, we will write everything in terms of  $F$ . By definition,  $\mu$  of  $x$  to 0 is minus  $F$  of  $x$  is equal to limit  $k$  going to infinity summation  $n$  equal to 0 to  $k$ . This is nothing but  $F$  of

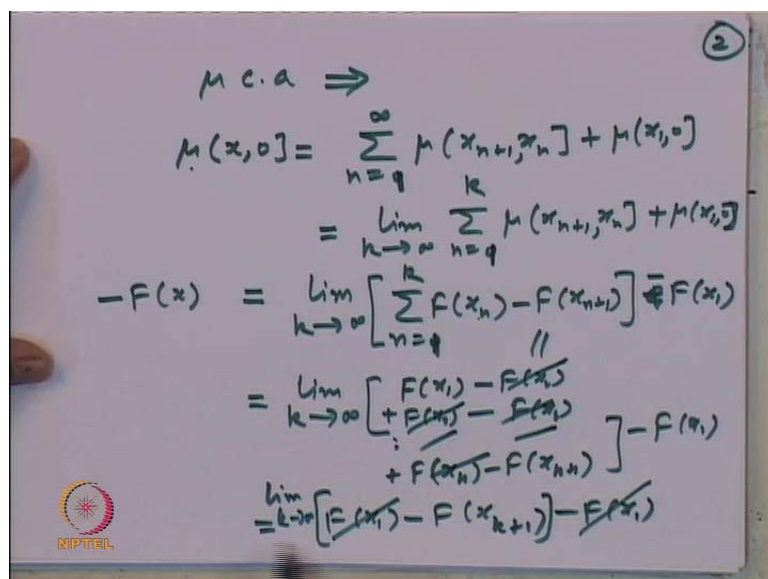

$x_n$  minus  $F$  of  $x_{n+1}$  plus  $F$  of  $x_1$  to 0 so that is in fact minus  $F$  of  $x_1$ . Now, let us note what this is. This is limit  $k$  going to infinity. What is this sum? This starts with  $n$  equal to 0 will give  $x_0$ . That is not so let us so. There was a mistake here.

(Refer Slide Time: 09:57)

I should have written as union from  $n$  equal to 1 because it is 1 to 2 and so on. That was the mistake here

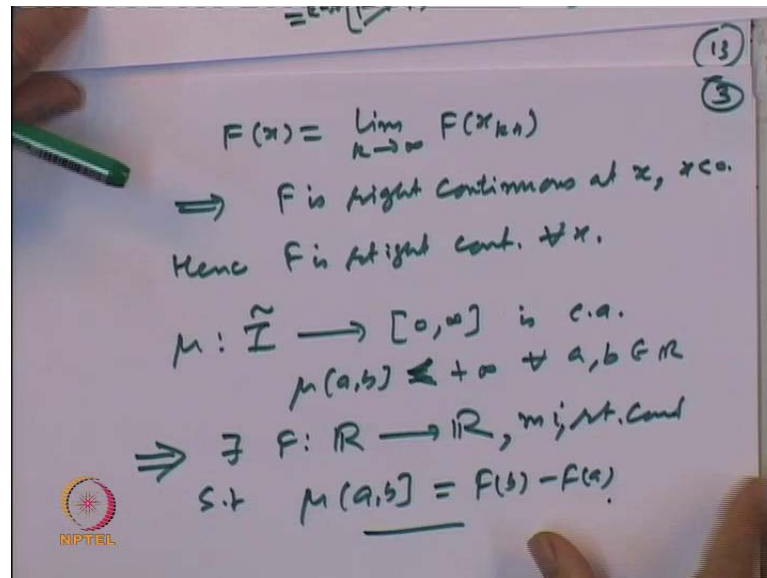

(Refer Slide Time: 09:57)

This sum is from  $n$  equal to 1 to,  $n$  equal to 1 to,  $n$  equal to 1 to  $k$  (Refer Slide Time: 10:12). What is this sum?  $n$  equal to 1 gives you  $F$  of  $x_1$  minus  $F$  of  $x_2$  plus  $F$  of  $x_2$

minus  $F$  of  $x_3$  and so on plus  $F$  of  $x_n$  equal to  $k$ ; so that is  $x_k$  minus  $F$  of  $x_{k+1}$ . So, that is this part – this sum – and minus  $F$  of  $x_1$  (Refer Slide Time: 10:42). We observe that in this  $x_2$  and  $x_2$  will cancel out; what was left is this is equal to  $F$  of  $x_1$  minus  $F$  of  $x_{k+1}$  minus  $F$  of  $x_1$ . In this equation, this cancels with this; so, minus  $F$  of  $x$ . Sorry, there is a limit outside; so, limit of this  $k$  going to infinity.

(Refer Slide Time: 11:21)

This gives us that  $F$  of  $x$  is equal to limit  $k$  going to infinity of  $F$  of  $x_{k+1}$ . That proves the fact that  $F$  is right-continuous at  $x$  in the case when  $x$  was less than 0. Hence,  $F$  is right-continuous for every  $x$ . This proves the theorem that if  $\mu$  on the class of all left-open right-closed intervals is countably additive with the property that  $\mu$  of  $a, b$  is finite for every  $a, b$  in  $\mathbb{R}$ , then this implies there exists a function  $F$  which is monotonically increasing and right-continuous such that  $\mu$  of  $a, b$  is equal to  $F$  of  $b$  minus  $F$  of  $a$ . What we have shown is that to every countably additive set function  $\mu$  on left-open right-closed intervals, you can associate a monotonically increasing right-continuous function. This is proved (Refer Slide Time: 13:06).

(Refer Slide Time: 13:11)

**Countably additive set functions on intervals**

- We proved it when  $x \geq 0$ .  
To complete the proof, we prove it for  $x < 0$ .
- Thus, every be a countably additive set function  $\mu : \tilde{\mathcal{I}} \rightarrow [0, \infty]$ , such that  $\mu(a, b] < +\infty$ , for every  $a, b \in \mathbb{R}$ . is given by a monotonically increasing right continuous function  $F : \mathbb{R} \rightarrow \mathbb{R}$  with

$$\mu(a, b] = F(b) - F(a) \quad \forall a, b \in \mathbb{R}.$$

The converse of above is also true:

©2006 K. Sreenivas Rao, IIT Bombay. p.5/13

This completes the proof of the fact that to every countably additive set function on the class of intervals, we can associate a monotonically increasing right-continuous function with this property; in fact, the converse of this statement also holds. What will be the converse of such a statement? The converse of such a statement would be that if you are given a monotonically increasing right-continuous function  $F$ , then we can define a set function  $\mu$  on left-open right-closed intervals in such a way that this relation is satisfied. That will prove that the only way we can construct countably additive set functions on the class of intervals is via monotonically increasing right-continuous functions.

(Refer Slide Time: 14:18)

**Countably additive set functions on intervals**

- Let  $F : \mathbb{R} \rightarrow \mathbb{R}$  be a monotonically increasing function.

Define  $\mu_F : \tilde{\mathcal{I}} \rightarrow [0, \infty]$  by: for  $a, b \in \mathbb{R}$ ,

$$\mu_F(a, b] := F(b) - F(a),$$
$$\mu_F(-\infty, b] := \lim_{x \rightarrow \infty} [F(b) - F(-x)],$$
$$\mu_F(a, \infty) := \lim_{x \rightarrow \infty} [F(x) - F(a)],$$
$$\mu_F(-\infty, \infty) := \lim_{x \rightarrow \infty} [F(x) - F(-x)].$$

 ©2006 K. Sreenivas (IIT Bombay) p.613

The converse part of the theorem says the following. Let  $F$  be a monotonically increasing function from  $\mathbb{R}$  to  $\mathbb{R}$ . Define  $\mu_F$  – a set function on the class of all left-open right-closed intervals as follows. For any two real numbers  $a$  and  $b$ , we want to define what is  $\mu_F$  of the left-open right-close intervals  $a, b$ . This is a property that has to be satisfied by  $F$ ; that itself gives us the defining property of the set function  $\mu$ . So,  $\mu_F$  of the left-open right-close interval is defined as the difference  $F$  of  $b$  minus  $F$  of  $a$  for all real numbers  $a$  and  $b$ .

Now, the question comes: what happens if  $b$  is equal to plus infinity or  $a$  is equal to minus infinity or both of them? In that case, we write this as for  $\mu_F$  of the infinite interval minus infinity to  $b$ . It is open on the left side and closed on the right side  $b$ ; so, it is a left-open right-close interval on the real line. What we do is we take the definition as  $F$  of  $b$  minus  $F$  of minus  $x$ ,  $x$  going to infinity.

As  $x$  goes to infinity, minus  $x$  will go to minus infinity; we are defining it via limits. Look at the interval minus  $x$  to  $b$  – left open; that is the value of the  $\mu$  of  $F$ ; then, take the limit of that as  $x$  goes to infinity. This is a definition of  $\mu_F$  of minus infinity to  $b$ . Similarly, if it is on the right side, if  $a$  to infinity, we define it as take the interval  $a$  to closed  $x$ ; then, the value of that will be  $F$  of  $x$  minus  $F$  of  $a$  and now take the limit of that as  $x$  goes to infinity.

The infinite interval unbounded on the right side, left-open right-closed,  $a$  to infinity is defined as  $\lim_{x \rightarrow \infty} (F(x) - F(a))$ . If it is the whole real line, then we define  $\mu_F$  of the whole real line to be  $\lim_{x \rightarrow \infty} (F(x) - F(-x))$ . Look at the interval  $-x$  to  $x$  and let both sides go to infinity. This is the way we define  $\mu$  of  $F$ .

Note that this is a generalization of the length function. If  $F$  is the identity function namely  $F(x) = x$ , that is a monotonically increasing function, then this is nothing but  $b - a$ ; so  $\mu$  of  $a, b$  is nothing but  $b - a$ . This  $\mu_F$  is nothing but the length function when  $F$  is a monotonically increasing function. One can write down a proof of this on the lines of when we proved that the length function is countably additive.

On the same lines, one can write down the proof of the fact that this set function  $\mu_F$  is also countably additive. One can wonder where one will be using the fact that  $F$  is right-continuous. Where we will be using the right continuity of this  $F$  is to prove that it is monotonically increasing – to prove that  $\mu_F$  is countably additive. If this  $F$  is monotonically increasing, we can define this  $\mu_F$  is finitely additive but to prove countably additive, we need  $F$  to be a right-continuous function.

If  $F$  is right-continuous, then one can write down a proof similar to that of the case of the length function. One uses the fact of right-continuity because one has to deal with the intervals which are left-open and right-closed. If you are keen to know a proof of this, you better write a proof yourself trying to see that the steps given for the proof of the length function is countable additive can be suitably modified to do this; we will leave it as an exercise. If you feel it is too tough an exercise, let us assume this and go ahead.

(Refer Slide Time: 19:06)

Countably additive set functions on intervals

- $\mu_F$  is a well-defined finitely additive set function on  $\tilde{\mathcal{I}}$ .
- If  $F$  is right continuous, then  $\mu_F$  is also countably additive.
- One calls  $\mu_F$  the set function induced by  $F$ .

NPTEL

©Under K. Ramesh, IIT Bombay - p.913

$\mu_F$  is a finitely additive set function and using if  $F$  is right-continuous, one proves that  $\mu_F$  is also countably additive. This function  $\mu_F$  is called the set function induced by the increasing function  $F$ .

(Refer Slide Time: 19:26)

Countably additive set functions on intervals

- Completely characterize the non-trivial countably additive set functions on intervals in terms of functions  $F : \mathbb{R} \rightarrow \mathbb{R}$  which are monotonically increasing and right continuous.
- In case  $\mu(\mathbb{R}) < +\infty$ , a more canonical choice for the required function  $F$  is

$$F(x) := \mu(-\infty, x], \quad x \in \mathbb{R}.$$

Such functions are called **distribution functions on  $\mathbb{R}$** .

NPTEL

©Under K. Ramesh, IIT Bombay - p.913

This gives us a complete characterization of nontrivial countably additive set functions. Why nontrivial? It is because we are looking at  $\mu$  of the left-open right-closed interval  $a, b$  to be finite in terms of functions which are monotonically increasing and right-

continuous. In some sense, there is a correspondence between measures on the class of all intervals and monotonically increasing right-continuous functions.

In case that countably additive set function  $\mu$  has the property that  $\mu$  of the whole real line is finite, then one can select this monotonically increasing function to be  $\mu$  of minus infinity to  $x$  because that is defined; we do not have to restrict the fact that  $\mu$  of  $a, b$  is finite; that will be true anyway because this is finite. A more canonical choice for the monotonically increasing right-continuous function is  $\mu$  of minus infinity to  $x$  when  $\mu$  of the whole space  $\mathbb{R}$  is finite.

In that case, this function  $F$  is called the distribution function on  $\mathbb{R}$ . This plays a role in the theory of probability where monotonically increasing right-continuous functions are studied via what are called probability distributions. We will not go into that; we will just make a note of it in case we have a finite condition that  $\mu$  of  $\mathbb{R}$  is finite – we will take  $F$  of  $x$  to be this function (Refer Slide Time: 21:15). We have characterized all countably additive set functions on the class of all intervals.

(Refer Slide Time: 21:33)

**Set functions on algebras**

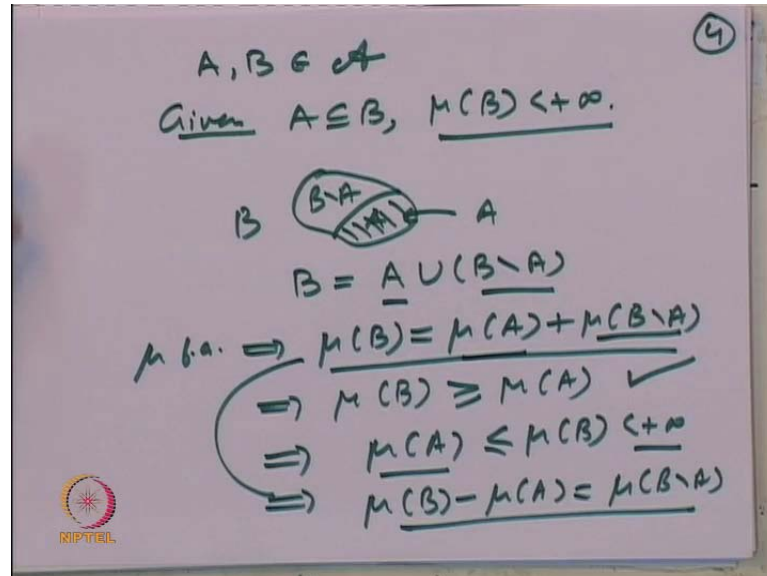

- Let  $\mathcal{A}$  be an algebra of subsets of a set  $X$  and let  $\mu : \mathcal{A} \rightarrow [0, \infty]$  be a set function. Then the following hold:
  - (i) If  $\mu$  is finitely additive and  $\mu(B) < +\infty$  for  $B \in \mathcal{A}$  then
$$\mu(B - A) = \mu(B) - \mu(A)$$
for every  $A \in \mathcal{A}, A \subseteq B$ .  
In particular,  $\mu(\emptyset) = 0$  if  $\mu$  is finitely additive and  $\mu(B) < +\infty$  for some  $B \in \mathcal{A}$ .

NPTEL

What we shall do next is the following: we will study what are called set functions on a general class of sets called algebras. Let us start with looking at  $\mathcal{A}$  – an algebra of subsets of a set  $X$  – and  $\mu$ , a set function defined on this algebra taking nonnegative real values (taking values 0 to infinity). We want to show that the following holds: if  $\mu$  is finitely additive and  $\mu$  of the set  $B$  is finite for a set  $B$  in the algebra  $\mathcal{A}$ , then  $\mu$  of the

difference  $B$  minus  $A$  is equal to  $\mu$  of  $B$  minus  $\mu$  of  $A$  whenever  $A$  is in the algebra and  $A$  is a subset of  $B$ . What we are saying is the following.

(Refer Slide Time: 22:27)

Let us take sets  $A$  and  $B$  belonging to the algebra  $\mathcal{A}$ . We are given, of course, that  $A$  is a subset of  $B$  and  $\mu$  of  $B$  is finite. Here is the set  $B$  and  $A$  is a part of it; this is  $B$ ; that is  $A$ ; this part is  $A$  (Refer Slide Time: 22:52). We can write  $B$  as  $A$  union  $B$  minus  $A$ ; this is the part  $B$  minus  $A$ . Note that  $A$  and  $B$  minus  $A$  both are disjoint sets;  $B$  is written as a finite union – in fact, union of the two sets  $A$  and  $B$  minus  $A$  and they are pairwise disjoint.

$\mu$  finitely additive implies that  $\mu$  of  $B$  is equal to  $\mu$  of  $A$  plus  $\mu$  of  $B$  minus  $A$ . Now, let us note that all these are real numbers;  $\mu$  of  $B$  is a real number because it is finite;  $\mu$  of  $A$  is a real number because  $A$  is a subset of  $B$  and  $\mu$  of  $A$  will be less than or equal to  $\mu$  of  $B$ ; that is finite. This is an equation in real numbers anyway; that is not really important here but note that all are nonnegative quantities.

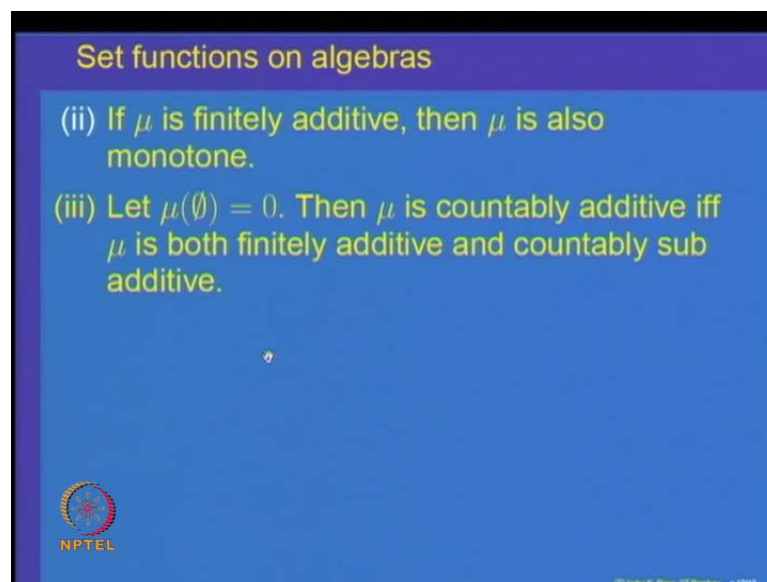

That implies that  $\mu$  of  $B$  is bigger than or equal to a  $\mu$  of  $A$ ; that is one thing that we observe because this is nonnegative. This also implies that  $\mu$  of  $A$  is less than or equal to  $\mu$  of  $B$  which is finite. That implies that  $\mu$  of  $A$  is finite. In this equation, I can say all are real numbers and so I can manipulate this as an equation in real numbers. This equation implies that if I take it on the other side,  $\mu$  of  $B$  minus  $\mu$  of  $A$  is equal to  $\mu$  of  $B$  minus  $A$ .

That is what we wanted to prove. Note here we have used the fact  $\mu$  of  $B$  is finite (Refer Slide Time: 24:54). Hence,  $\mu$  of every subset of it is finite whenever that set is in the algebra. We can manipulate this as an equation only when they are real numbers; if they are equal to plus infinity at any one of them, then I cannot transpose them on the other side and write this equation.

We have used the fact that  $\mu$  is finitely additive and  $\mu$  of  $B$  is finite (Refer Slide Time: 25:20). That implies for every subset  $A$  of  $B$  which is in the algebra,  $\mu$  of  $A$  is also finite and  $\mu$  of  $B$  minus  $A$  is equal to  $\mu$  of  $B$  minus  $\mu$  of  $A$ . In particular, suppose I take  $B$  equal to  $A$ , this gives  $\mu$  of empty set is equal to 0; in particular,  $\mu$  of empty set is 0 if  $\mu$  is finitely additive and  $\mu$  for at least one set  $B$  is finite. These are consequences of a set function being finitely additive.

What we are trying to show is if a set function is finitely additive, what are the possible consequences? We showed finite additivity implies monotone; if  $B$  is finite, then I can interchange and write  $\mu$  of  $B$  minus  $A$  to  $B$  equal to this. Finite additive plus  $\mu$  of at least one set is finite implies  $\mu$  of  $\emptyset$  is equal to 0.

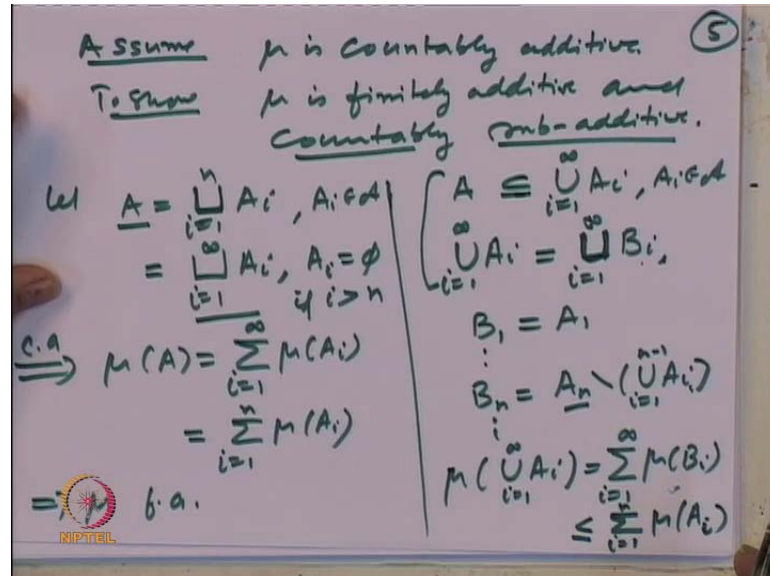

(Refer Slide Time: 26:24)

$\mu$  is monotone we have already shown. Let us look at the next property; that is a very important thing – characterization of countable additiveness of the set function. Suppose  $\mu$  of  $\emptyset$  is equal to 0, then we want to claim that  $\mu$  is countably additive if and only if  $\mu$  is both finitely additive and countably subadditive. We want to characterize the

countable additive property of the set function defined on an algebra in terms of it being finitely additive and countably subadditive.

(Refer Slide Time: 27:15)

Let us prove these properties. Let us start by one way. Let us assume that  $\mu$  is countably additive. We have to show  $\mu$  is finitely additive and countably subadditive. Let us look at the first thing. To show it is finitely additive, what do we have to do? Let  $A$  be equal to a disjoint union  $A_i, i$  equal to 1 to  $n$ . Whenever the union is disjoint sets – pairwise disjoint, we will write it as a square union (a symbol for cup instead of writing it as usual) where  $A_i$ s belong to the algebra  $\mathcal{A}$ .

I can also write it as union of  $A_i, i$  equal to 1 to infinity where  $A_i$  is equal to empty set if  $i$  is bigger than  $n$ ; from  $n$  onwards let us put them as empty sets. Then,  $A$  is a countable union of pairwise disjoint sets. This implies by countable additive property that  $\mu$  of  $A$  is equal to summation  $\mu$  of  $A_i$ s,  $i$  equal to 1 to infinity, but that is same as sigma  $i$  equal to 1 to  $n$   $\mu$  of  $A_i$  because for  $i$  bigger than or equal to  $n$  plus 1, the sets are empty and  $\mu$  of the empty set is given to be 0; therefore, it implies  $\mu$  is finitely additive.

On the other side, let us try to prove that  $\mu$  is countably subadditive. Let us take a set  $A$  in the algebra and let us say this is contained in union of  $A_i$ s  $i$  equal to 1 to infinity. Now, let us observe the following: this union  $A_i, i$  equal to 1 to infinity where  $A_i$ s are in the algebra  $\mathcal{A}$ ... (Refer Slide Time: 29:59). If you recall, we had shown that any countable union of sets in the algebra can be written as a countable union of disjoint sets in the

algebra where again  $B_i$ s are in the algebra but this is a disjoint union. How did we do that? Let us just recall that we defined  $B_1$  to be equal to  $A_1$  and in general  $B_n$  to be equal to  $A_n$  minus union  $A_i$ ,  $i$  equal to 1 to  $n$  minus 1 and so on; that is how we had defined those sets  $B_i$ .

Note that at every stage  $B_1$  is  $A_1$  in the algebra; so  $B_1$  is in the algebra. Similarly,  $B_n$  is  $A_n$  which is in the algebra; finite union  $A_i$  1 to  $n$  minus 1 is in the algebra; the difference of the two sets in the algebra is again an algebra; so, each  $B_n$  is an element of the algebra. These are disjoint and their union because union  $B_1$  up to  $B_n$  is the same as union up to  $A_1$  to  $A_n$  and that is true for every  $n$ ; so this is equal to true (Refer Slide Time: 31:14).

Using these two things, now let us write.  $A$  is a subset of this. This says  $\mu$  of the union  $A_i$ s,  $i$  equal to 1 to infinity will be equal to summation  $\mu$  of  $B_i$ s,  $i$  equal to 1 to infinity because this union  $A_i$  is the same as union  $B_i$ s. Union of  $B_i$ s is a disjoint union; by countable additive property,  $\mu$  of the union is equal to this sum (Refer Slide Time: 32:00). Note that each  $B_n$  is a subset of  $A_n$  and by finite additive property – monotone property, this is less than  $\mu$  of  $A_i$ ,  $i$  equal to 1 to  $n$ .

(Refer Slide Time: 32:31)

Handwritten mathematical derivation on a whiteboard:

$$\mu\left(\bigcup_{i=1}^{\infty} A_i\right) \leq \sum_{i=1}^{\infty} \mu(A_i) \quad (6)$$

$$A \subseteq \bigcup_{i=1}^{\infty} A_i$$

$$\Rightarrow A = \bigcup_{i=1}^{\infty} (A \cap A_i)$$

$$\Rightarrow$$

The whiteboard also features the NPTEL logo in the bottom left corner.

$$b.a. \quad \mu\left(\bigcup_{i=1}^{\infty} A_i\right) = \sum_{i=1}^{\infty} \mu(B_i) \leq \sum_{i=1}^{\infty} \mu(A_i)$$

$$\Rightarrow A = \bigcup_{i=1}^{\infty} (A \cap A_i)$$

$$\Rightarrow \underline{\mu(A)} = \mu\left(\bigcup_{i=1}^{\infty} (A \cap A_i)\right) \leq \mu\left(\bigcup_{i=1}^{\infty} A_i\right) \leq \underline{\sum_{i=1}^{\infty} \mu(A_i)}$$

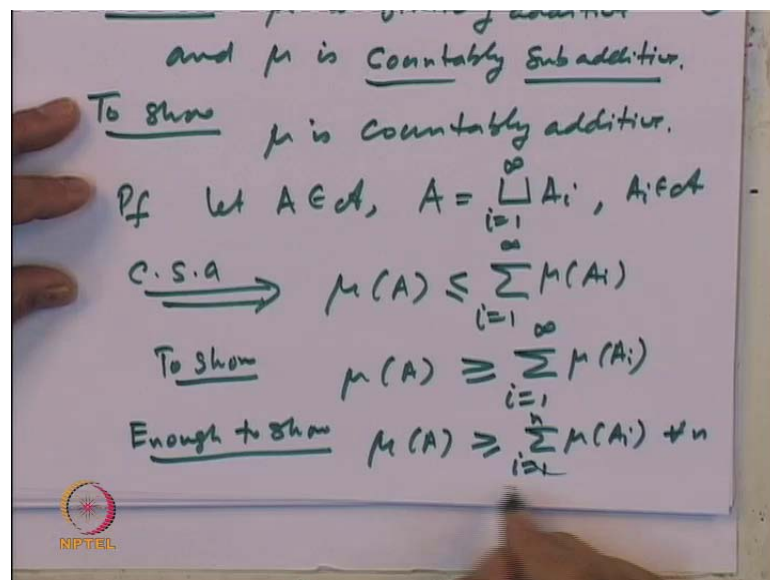

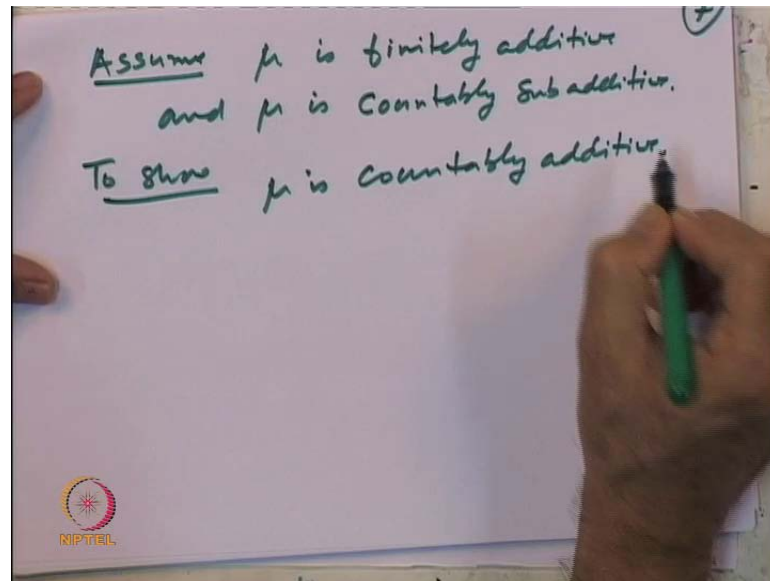

The whiteboard also shows a small logo for NPTEL in the bottom left corner.

What we have shown is the following:  $\mu$  of union  $A_i$ ,  $i$  equal to 1 to infinity is less than or equal to  $\sum_{i=1}^{\infty} \mu$  of  $A_i$ . We just want to conclude that in fact  $\mu$  of  $A$  is less than or equal to this quantity. Now, let us observe;  $A$  is a subset of union  $A_i$ . This implies that I can write  $A$  is equal to union of  $A$  intersection  $A_i$ ,  $i$  equal to 1 to infinity; I can just intersect and then this is an equality.

That means  $\mu$  of  $A$  is equal to  $\mu$  of union  $i$  equal to 1 to infinity  $A$  intersection  $A_i$ . **This is less than or equal to... because...** This union is a subset of the union; so, this is less than  $\mu$  of union  $i$  equal to 1 to infinity of  $A_i$ s because each one is a subset of this; so, this union is subset of this (Refer Slide Time: 33:46). From here, this is less than or equal to summation  $i$  equal to 1 to infinity of  $\mu$  of  $A_i$ .

We have shown that whenever  $A$  **is an element in the algebra is a subset of union of  $A_i$ s**,  $i$  equal to 1 to infinity (Refer Slide Time: 34:11), then  $\mu$  of  $A$  is less than or equal to summation  $\mu$  of  $A_i$ s. That proves that  $\mu$  is countably subadditive. We have shown if  $\mu$  is countably additive, then this implies  $\mu$  is finitely additive and also  $\mu$  is countably subadditive (Refer Slide Time: 34:32). That completes one part of the proof; let us prove the other way around implication.

(Refer Slide Time: 34:42)

Assume  $\mu$  is finitely additive and  $\mu$  is countably subadditive. We have to show  $\mu$  is countably additive. To prove countable additivity, what do we have to show? Let  $A$  belong to algebra and  $A$  be equal to disjoint union  $A_i$ s, 1 to infinity and  $A_i$ s belonging to algebra. We have to show  $\mu$  of  $A$  is summation  $\mu$  of  $A_i$ s. Now, by countable subadditive property which is given to us, countable subadditive implies that  $\mu$  of  $A$  is at least less than or equal to sigma  $i$  equal to 1 to infinity  $\mu$  of  $A_i$ s; countable subadditivity implies the fact that this is less than or equal to this (Refer Slide Time: 36:09).

We have to prove only the other way – show that  $\mu$  of  $A$  is also greater than or equal to  $\sum_{i=1}^{\infty} \mu$  of  $A_i$ ; this is what we have to show. Here is a small observation: to show this, it is enough to show that  $\mu$  of  $A$  is bigger than or equal to  $\sum_{i=1}^n \mu$  of  $A_i$  for every  $n$ . If you can show for every  $n$  that  $\mu$  of  $A$  is bigger than or equal to this, then it also will be true for  $i$  equal to 1 to infinity because this is nothing but limit of these partial sums; this is enough to show; we have to only show that  $\mu$  of  $A$  is bigger than or equal to  $\sum_{i=1}^n \mu$  of  $A_i$ ,  $i$  equal to 1 to  $n$ .

(Refer Slide Time: 37:13)

The image shows a whiteboard with handwritten mathematical notes. At the top right, there is a circled number '2'. The text reads:

Note  $A = \bigcup_{i=1}^{\infty} A_i$

$\Rightarrow \forall n \quad \bigcup_{i=1}^n A_i \subseteq A$

$\mu$  f.a. ( $\Rightarrow \mu$  monotone)

$\Rightarrow \mu \left( \bigcup_{i=1}^n A_i \right) \leq \mu(A) \quad \forall n$

f.a.

$\Rightarrow \sum_{i=1}^n \mu(A_i) \leq \mu(A) \quad \forall n$

$\Rightarrow \sum_{i=1}^{\infty} \mu(A_i) \leq \mu(A)$

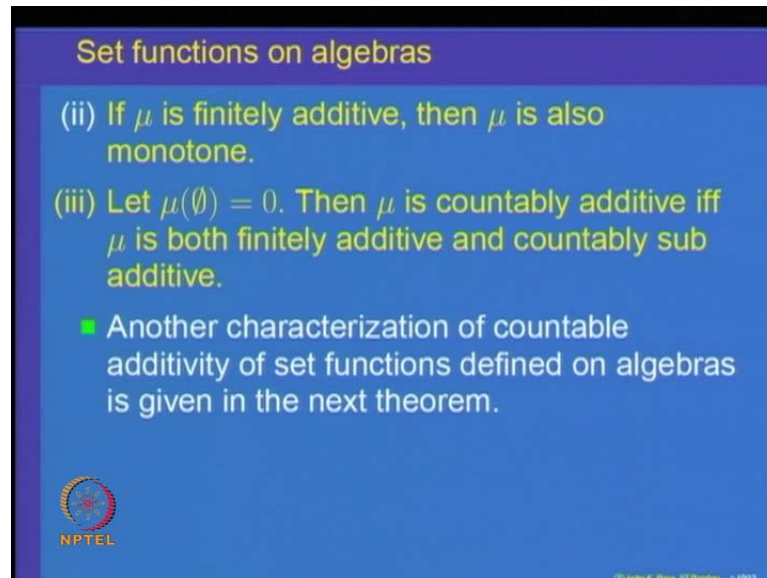

In the bottom left corner, there is a logo for NPTEL (National Programme on Technology Enhanced Learning).

Note that  $A$  equal to union  $A_i$ ,  $i$  equal to 1 to infinity implies for every  $n$ , the union  $A_i$ ,  $i$  equal to 1 to  $n$  is a subset of  $A$  for every  $n$ . We are in algebra; so, this set is in the algebra; this is in the algebra (Refer Slide Time: 37:37).  $\mu$  finitely additive implies  $\mu$  monotone and hence implies that  $\mu$  of union  $A_i$ ,  $i$  equal to 1 to  $n$  will be less than or equal to  $\mu$  of  $A$  for every  $n$ ; again by finite additivity, this is nothing but  $\sum_{i=1}^n \mu$  of  $A_i$  is less than or equal to  $\mu$  of  $A$  for every  $n$ ; this is happening for every  $n$ . We can let  $n$  go to infinity and so  $\sum_{i=1}^{\infty} \mu$  of  $A_i$  is less than or equal to  $\mu$  of  $A$ .

That proves the other way around inequality also of the required thing; this proves this (Refer Slide Time: 38:31); that proves that  $\mu$  is countably additive. What we have proved is the following (Refer Slide Time: 38:43). We have given a characterization of countable additive property of set functions which are finitely additive. If  $\mu$  of empty

set is equal to 0, then  $\mu$  is countably additive if and only (note here the if and only if – we have proved both ways)  $\mu$  is both finitely additive and countably subadditive. This is a characterization of countable additiveness of set functions, but, of course, the domain of the set function should be an algebra; that is important; this is a very useful criterion for countable additivity.

(Refer Slide Time: 37:13)

**Set functions on algebras**

- (ii) If  $\mu$  is finitely additive, then  $\mu$  is also monotone.
- (iii) Let  $\mu(\emptyset) = 0$ . Then  $\mu$  is countably additive iff  $\mu$  is both finitely additive and countably subadditive.

■ Another characterization of countable additivity of set functions defined on algebras is given in the next theorem.

 NPTEL

We will prove another characterization of countable additivity of set functions in terms of increasing and decreasing limits; that we will in the next theorem. That theorem is again about set functions defined on algebras.

(Refer Slide Time: 39:50)

**Set functions on algebras**

- Let  $\mathcal{A}$  be an algebra of subsets of a set  $X$  and let  $\mu : \mathcal{A} \rightarrow [0, \infty]$  be finitely additive and  $\mu(\emptyset) = 0$ . Then  $\mu$  is countably additive if and only if the following hold: For any  $A \in \mathcal{A}$ ,

$$\mu(A) = \lim_{n \rightarrow \infty} \mu(A_n).$$

whenever  $A_n \in \mathcal{A}$  are such that  $A_n \subseteq A_{n+1} \forall n$  and  $A = \bigcup_{n=1}^{\infty} A_n$ .

This is called the **continuity from below** of  $\mu$  at  $A$ .

NPTEL

© 2011 IIT Bombay. All Rights Reserved. p. 11/13

The theorem says the following: let  $\mathcal{A}$  be an algebra of subsets of a set  $X$  and  $\mu$  be finitely additive and with the property, of course,  $\mu(\emptyset) = 0$ . Then, we want to prove that  $\mu$  is countably additive if and only if, once again it is a characterization, the following property holds. The property says for any element  $A$  in the algebra  $\mathcal{A}$ , we should have  $\mu(A) = \lim_{n \rightarrow \infty} \mu(A_n)$ . What are  $A_n$ s? Whenever  $A_n$  is a sequence of sets in the algebra which is increasing –  $A_n$  is a subset of  $A_{n+1}$  for every  $n$  and the sequence  $A_n$  should be increasing **and  $A$  should be  $(\bigcup_{n=1}^{\infty} A_n)$ .**

Sorry,  $A_n$  should be increasing;  $A_n$  is the subset of  $A_{n+1}$ ; that means  $A_n$ s are increasing sequence of sets in the algebra and  $A$  is the union of all these sets  $A_n$ . This is a characterization of countable additiveness of the set function  $\mu$  provided one can prove the following: for any set  $A$  and for any sequence  $A_n$  of sets in the algebra which is increasing and  $A$  is the union, we should have  $\mu(A) = \lim_{n \rightarrow \infty} \mu(A_n)$ . Let us prove this property once again.

(Refer Slide Time: 41:25)

Let  $\mu$  be countably additive (9)

To show let  $A \in \mathcal{A}$ ,  $A_n \in \mathcal{A}$ ,  
 $A_n \subseteq A_{n+1}$ ,  $A = \bigcup_{n=1}^{\infty} A_n$   
 $\Rightarrow \mu(A) = \lim_{n \rightarrow \infty} \mu(A_n)$ ?

Pf let  $B_n := A_n \setminus \left( \bigcup_{i=1}^{n-1} A_i \right)$ ,  $n \geq 1$   
Then  $B_n \in \mathcal{A} \forall n$ ,  $B_n \cap B_m = \emptyset$   
 $A = \bigcup_{n=1}^{\infty} A_n = \bigsqcup_{n=1}^{\infty} B_n$   
c.a.  $\Rightarrow \mu(A) = \mu\left(\bigsqcup_{n=1}^{\infty} B_n\right)$   
 $= \sum_{n=1}^{\infty} \mu(B_n)$

To prove this, what do we have to show? First, let  $\mu$  be countably additive. We have to show the following. Take a set  $A$  belonging to the algebra, take a sequence  $A_n$ s belonging to the algebra such that  $A_n$  is subset of  $A_{n+1}$  and  $A$  is equal to union of  $A_n$ s. We should show that  $\mu$  of  $A$  is equal to limit  $n$  going to infinity  $\mu$  of  $A_n$ s; that is what is to be shown. Let us observe that  $A$  is union of  $A_n$ s and we are given something about countable additivity.

The obvious thing is try to write the union as a countable disjoint union; we do that. Proof: let  $B_n$  be defined as  $A_n$  minus union  $A_i$ ,  $i$  equal to 1 to  $n-1$  for every  $n$  bigger than or equal to 1. Then, as observed earlier, each  $B_n$  belongs to the algebra;  $B_n$ s are disjoint; and  $A$  which is union of  $A_n$ s is also equal to union of  $B_n$ s. Of course, this is disjoint; let me write that this is equal to this (Refer Slide Time: 43:16). It implies by countable additive property  $\mu$  of  $A$  is equal to  $\mu$  of this union  $B_n$ s and by countable additive property, that is summation  $n$  equal to 1 to infinity  $\mu$  of  $B_n$ s; that is by countable additive property.

(Refer Slide Time: 43:52)

$$\begin{aligned} &= \lim_{k \rightarrow \infty} \sum_{n=1}^k \mu(B_n) \\ &= \lim_{k \rightarrow \infty} \left( \mu \left( \bigcup_{n=1}^k B_n \right) \right) \\ &= \lim_{k \rightarrow \infty} \left( \mu \left( \bigcup_{n=1}^k A_n \right) \right) \\ &= \lim_{k \rightarrow \infty} \left( \mu(A_k) \right) \end{aligned}$$

The whiteboard also features a logo for MPTEL in the bottom left corner and a circled number '10' in the top right corner.

But we do not want  $B_n$ s; we want something in terms of  $A_n$ s; here is an observation. This summation I can write as limit  $k$  going to infinity of the partial sums so  $n$  equal to 1 to  $k$  of  $\mu$  of  $B_n$ s but  $B_n$ s are disjoint; this is same as limit  $k$  going to infinity of  $\mu$  of union  $B_n$ ,  $n$  equal to 1 to  $k$  because  $B_n$ s are disjoint; by finite additive property, this must be true.

If you note, once again,  $\mu$  is given to be countable additive and hence it is finite additive; by finite additive property, this is true. Now, the observation is that the union of  $B_n$ s  $n$  equal to 1 to  $k$  is same as the union of  $A_n$ s. This is the same as  $k$  going to infinity  $\mu$  of union  $A_n$ ,  $n$  equal to 1 to  $k$  but note we have not used anywhere the fact that  $A_n$ s are increasing. Since  $A_n$ s are increasing, what is this union? This union is precisely  $\mu$  of the largest set; that is  $A_k$ ; so, that is  $\mu$  of  $A_k$  (Refer Slide Time: 45:21).

We have shown  $\mu$  of  $A$  is limit of  $\mu$  of  $A_k$ s going to infinity whenever  $A_n$  is a sequence which is increasing (whenever  $A_n$ s are increasing) and  $A$  is equal to union (Refer Slide Time: 45:40). We have proved one way – countable additivity implies the required property. Let us look at the converse (Refer Slide Time: 45:47).

(Refer Slide Time: 45:49)

$\leftarrow \mu$  has the given property (11)  
 To show  $\mu$  is c.a., i.e.  
 $A = \bigcup_{n=1}^{\infty} A_n$ ,  $A, A_n \in \mathcal{A}$   
 $= \bigcup_{k=1}^{\infty} \left( \bigcup_{n=1}^k A_n \right)$   
 $B_k$   
 Given hypothesis  $\Rightarrow \mu(A) = \lim_{k \rightarrow \infty} \mu(B_k)$   
 $= \lim_{k \rightarrow \infty} \mu\left(\bigcup_{n=1}^k A_n\right)$   
 $= \lim_{k \rightarrow \infty} \left( \sum_{n=1}^k \mu(A_n) \right)$   
 $= \sum_{n=1}^{\infty} \mu(A_n)$

Conversely, let us assume  $\mu$  has the given property. What is the given property? The given property says whenever a set  $A$  is written as union of  $A_n$ s and  $A_n$ s are increasing, then  $\mu$  of  $A$  is equal to  $\mu$  of the union. We want to show that  $\mu$  is countably additive; that is, let us take a set  $A$  which is disjoint union of sets  $A_n$ ,  $n$  equal to 1 to infinity where  $A$  and all  $A_n$ s are in the algebra.

We have to show that  $\mu$  of  $A$  is equal to summation  $\mu$  of  $A_n$ s but this I can write it as union over  $k$  1 to infinity union  $A_n$ ,  $n$  equal to 1 to  $k$ . Instead of taking  $n$  equal to 1 to infinity, take union of sets  $A_1, A_2$  up to  $A_k$  and then take the union over  $k$ ; both will be same. But the advantage of this way is that if we call this as  $B_k$ , then  $B_k$  is a set in the algebra because it is a finite union of sets in the algebra;  $B_k$  is increasing because we are taking union of more and more sets and their union is equal to  $A$ .

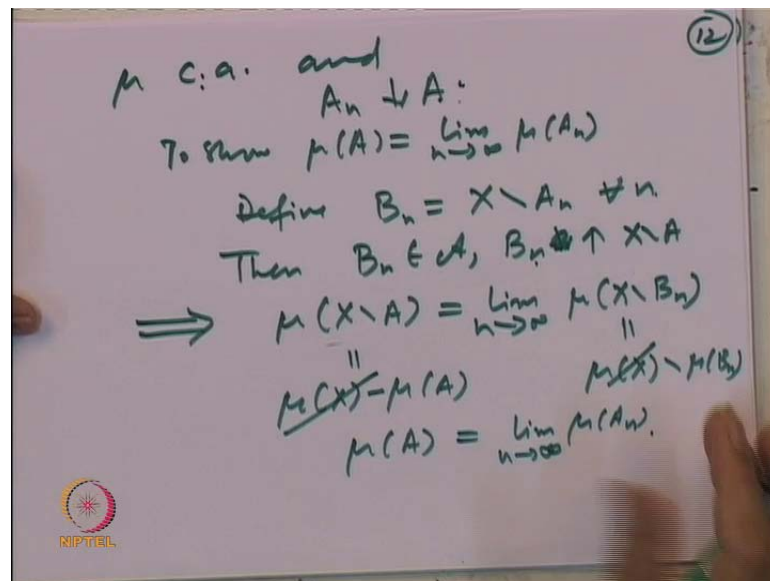

By the given hypothesis,  $\mu$  of  $A$  is equal to limit  $k$  going to infinity  $\mu$  of  $B_k$ . Now, let us go back to represent  $B_k$  in terms of  $A$ s; that is, limit  $k$  going to infinity  $\mu$  of union  $A_n$ ,  $n$  equal to 1 to  $k$ . We use the fact that  $\mu$  is finitely additive; this is limit  $k$  going to infinity summation  $n$  equal to 1 to  $k$  of  $\mu$  of  $A_n$ s, which is same as sigma 1 to infinity of  $\mu$  of  $A_n$ s. That says whenever  $A$  is a disjoint union of countable disjoint union of sets in the algebra,  $\mu$  of  $A$  is sigma  $\mu$  of  $A_n$ s; that is the countable additive property of the set function.

We have proved the theorem completely, namely, if  $\mathcal{A}$  is an algebra of subsets of a set  $X$  and  $\mu$  is finitely additive with that property, then  $\mu$  is countably additive if and only if  $\mu$  has the property that  $\mu$  of  $A$  is the limit of  $\mu$  of  $A_n$ s whenever  $A_n$  is increasing and  $A_n$  is equal to union of the sets (Refer Slide Time: 48:59). This is characterizing countable additivity in terms of limits of increasing sequence of sets. This property says that  $\mu$  is continuous from below at the point  $A$ ; so countable additivity for a finitely additive set function is the same as saying they are continuous from below at the point  $A$ ; from below because  $A$  is union of these sets. There is a corresponding result for sequences which are decreasing.

Let us state that result and prove it also (Refer Slide Time: 49:41). If  $\mathcal{A}$  is an algebra of subsets of a set  $X$  and  $\mu$  is finitely additive so that conditions are same as ((.)). We want the additional condition that  $\mu$  of the whole space is finite; this is the additional condition put to state the result, namely  $\mu$  of the whole space is finite. It says  $\mu$  is countably additive if and only if the following holds: for any set  $A$  in  $\mathcal{A}$  whenever  $\mu$  of  $A$  is equal to limit  $n$  going to infinity  $\mu$  of  $A_n$  and whenever  $A_n$ s are decreasing;  $A_{n+1}$  is subset of  $A_n$  and  $A$  is the intersection. Countable additivity is equal to saying for every set  $A$  in the algebra, if  $A$  is intersection of a decreasing sequence of sets  $A_n$ s, then  $\mu$  of  $A$  must be equal to limit of  $A_n$ s.

(Refer Slide Time: 50:52)

The proof of this uses the earlier theorem. Let us assume  $\mu$  is countably additive and  $A_n$ s decrease to  $A$ , all in the algebra  $\mathcal{A}$ . We want to show that  $\mu$  of  $A$  is equal to  $\lim_{n \rightarrow \infty} \mu$  of  $A_n$ . We know something about increasing sequences. From decreasing, we want to manufacture an increasing sequence; that is done via complements. So, define  $B_n$  to be equal to  $X$  minus  $A_n$  for every  $n$ . Then, each  $B_n$  belongs to the algebra  $\mathcal{A}$ ;  $B_n$  is decreasing because  $A_n$ s are  $B_n$ s are sorry increasing as  $A_n$ s are decreasing. Where do they decrease? The  $B_n$ s increase to  $X$  minus  $A$  because  $A_n$ s are decreasing to  $A$ .

By the earlier theorem, countable additivity implies whenever a sequence is increasing  $\mu$  of  $X$  minus  $A$  must be equal to  $\lim_{n \rightarrow \infty} \mu$  of  $X$  minus  $B_n$ , but now we use the fact that  $\mu$  of  $X$  is finite. This is same as  $\mu$  of  $X$  minus  $\mu$  of  $A$  (Refer Slide Time: 52:27). This thing is equal to  $\mu$  of  $X$  minus  $\mu$  of  $B_n$  and this is possible only because we have the fact that  $\mu$  of the whole space is finite; so, everything is a finite quantity and we have already shown  $\mu$  of the difference is equal to difference of  $\mu$ s provided the things are finite. So, this is equal to  $\lim_{n \rightarrow \infty}$  of this. Now,  $X$  cancels, **negative sign, limit**; so,  $\mu$  of  $A$  is equal to  $\lim_{n \rightarrow \infty} \mu$  of  $A_n$   $n$  going to infinity; countable additivity implies this.

(Refer Slide Time: 53:12)

Handwritten notes on a whiteboard:

$\mu$  has a given prop.  
 To show  $\mu$  is c.a.

$$A = \bigcap_{i=1}^{\infty} A_i = \bigcap_{n=1}^{\infty} \left( \bigcup_{i=1}^n A_i \right)$$

$$X \setminus A = \bigcup_{i=1}^{\infty} (X \setminus \bigcup_{i=1}^n A_i)$$

$$= \bigcup_{i=1}^{\infty} (B_n)$$

$$\mu(X \setminus A) = \lim_{n \rightarrow \infty} \mu(B_n)$$

$$\mu(X) - \mu(A) = \mu(X) - \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i)$$

$$= \sum_{i=1}^{\infty} \mu(A_i)$$

(13)

Let us assume this has that property that whenever  $A_n$ s **increase...**  $\mu$  has the given property. We have to show  $\mu$  is countably additive. Let us take  $A$  equal to a disjoint

union  $A_i$ s. What is  $X$  minus  $A$ ? That is intersection of  $i$  equal to 1 to infinity  **$X$  minus...** let us cite this as union of  $n$  equal to 1 to infinity union of  $A_i$ s,  $i$  equal to 1 to  $n$ . These are the  **$((.)$** . It is  $X$  minus union  $A_i$ ,  $i$  equal to 1 to  $n$ ; that is equal to intersection  $i$  equal to 1 to  $n$ ; **and this says nothing but,  $x$  minus so**. Let us call this set as  $B_n$ .

Note that  $B_n$ s are decreasing and they are in the algebra because  **$((.)$**  the  $A_n$ s are union  $n$ , this will be increasing and so this will be decreasing; so,  $\mu$  of  $x$  minus  $A$  by the given hypothesis is limit  $n$  going to infinity  $\mu$  of  $B_n$ s. What is  $\mu$  of  $B_n$ ?  $\mu$  of  $B_n$  is  $X$  minus this; that is equal to  $\mu$  of  $X$  minus limit  $n$  going to infinity  $\mu$  of the union that is disjoint; so, summation  $i$  equal to 1 to  $n$   $\mu$  of  $A_n$ s. This is equal to  $\mu$  of  $X$  minus  $\mu$  of  $A$  because everything is finite. This cancels with this (Refer Slide Time: 55:13) and so  $\mu$  of  $A$  is limit of this, which is equal to sigma 1 to infinity  $\mu$  of  $A_n$ s. That proves countable additivity.

We have proved that  $\mu$  is countably additive if and only if for a decreasing sequence of sets  $A_n$   $A$  equal to this intersection  $\mu$  of  $A$  is the limit under the condition  $\mu$  of  $X$  is finite (Refer Slide Time: 55:39). This is important and this condition cannot be removed; this kind of thing is called continuity from above.

(Refer Slide Time: 55:54)

**Remarks**

- In this theorem, the condition  $\mu(X) < +\infty$  necessary.
- Exercise:** Let  $\mathcal{A}$  be an algebra of subsets of a set  $X$  and  $\mu : \mathcal{A} \rightarrow [0, \infty]$  be a finitely additive set function such that  $\mu(X) < +\infty$ . Show that  $\mu$  is countably additive if and only if  $\lim_{k \rightarrow \infty} \mu(A_k) = 0$ , whenever  $\{A_k\}_{k \geq 1}$  is a sequence in  $\mathcal{A}$  with  $A_k \supseteq A_{k+1} \forall k$ , and  $\bigcap_{k=1}^{\infty} A_k = \emptyset$ .

NPTEL

© 2013 Prof. R. P. Kanbur, IIT Bombay

Here is a remark that the condition  $\mu$  of  $X$  is finite is necessary in the second part and cannot be removed. We request you to construct an example; you can construct very easily an example on the real line with length function as the set function. Here is an

exercise for you to do  $(\cdot)$  such that  $\mu$  is finite. Last part, we said  $A_n$  decreasing to  $A$ ; that you can actually reduce a bit. It says whenever  $A_n$ s are decreasing to empty set; that is also equivalent to saying that  $\mu$  is countably additive. These two parts we would like you to explore and understand and answer these questions. Thank you. Let us stop.
