Set functions on algebras

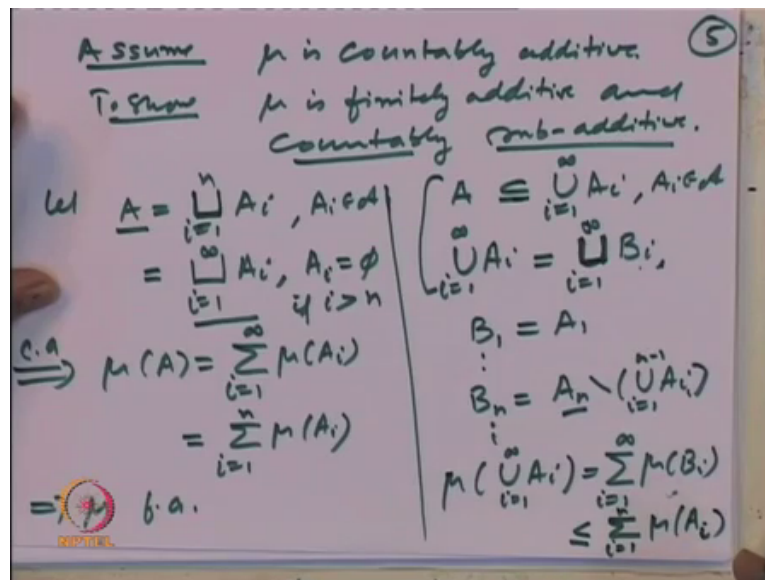

- (ii) If μ is finitely additive, then μ is also monotone.
- (iii) Let $\mu(\emptyset) = 0$. Then μ is countably additive iff μ is both finitely additive and countably sub additive.

NPTEL

© Inder K. Rana, IIT Bombay, 2015

So μ is monotone that we have already shown. So, let us look at the next property that is a very important thing we will characterize of countable additiveness of the set function. So, suppose $\mu(\emptyset) = 0$. Then we want to claim that μ is countably additive if and only if μ is both finitely additive and countably sub additive. So, we want to characterize countable additive property of the set function, define on an algebra in terms of it being finitely additive and countably sub additive. So, let us prove these properties. So, let us start with one way.

(Refer Slide Time: 01:07)

So, let us assume that μ is countably additive to show μ is finitely additive and countably sub additive.

So, let us look at the first thing to show it is finitely additive. What we are to do it. So, let A be equal to a disjoint union $A = \bigsqcup_{i=1}^n A_i$. So, whenever the union is disjoint sets where by disjoint we will write it as by a square union symbol for cup by the square instead of writing it as usual. So, where A_i is belong to the algebra \mathcal{A} now. So, I can also write it as union of A_i $i=1$ to infinity right where A_i is equal to empty set if i is bigger than n . From n onwards let us put them as empty sets then A is a countable union of pair wise disjoint sets. So, implies by countable additive property that $\mu(A)$ is equal to summation $\mu(A_i)$ $i=1$ to infinity.

But that is same as $\sum_{i=1}^n \mu(A_i)$. Because for i bigger than or equal to $n+1$ these sets are empty and μ of the empty set is given to be 0. So, therefore, implies μ finitely additive. On the other side let us try to prove that μ is countably sub additive. So, let us take a set A in the algebra and let us say this is contained in union of A_i $i=1$ to infinity. Now let us observe the following namely, this union $A = \bigcup_{i=1}^{\infty} A_i$ where A_i are in the algebra, if you recall we had shown that any countable union of sets in the algebra can be written as a countable union of disjoint sets in the algebra.

Where again b_i 's are in the algebra, but this is a disjoint union. How did we do that let us just recall we defined b_1 to be equal to a_1 and in general b_n to be equal to A_n minus union A_i i equal to 1 to $n-1$ and so on. So, that is how we are defined those sets b_i and note at every stage b_i is a A_i in algebra. So, b_1 in the algebra similarly b_n is A_n which is in the algebra finite union A_i 1 to $n-1$ that is in the algebra and the difference of the 2 sets in the algebra is in again algebra. So, each b_n is a element of the algebra these are disjoint and they are union because union of b_n up to b_n the same as union up to a_1 to A_n and that is true for every n . So, this is equal to true. So, once that is done.

So, using these 2 things now let us write that μ of a is a subset of this. So, this is μ of the union A_i i equal to 1 to infinity will be equal to summation μ of b_i i equal to 1 to infinity. Because this union A_i is same as union b_i 's, and union of b_i 's this is a disjoint union. So, by countably additive property μ of the union is equal to this sum right. And now note b_i is this each b_n is a subset of a_n . So, this is less than or equal to by finite additive property monotone property this is less than μ of A_n A_i i equal to 1 to n . So, what we have shown is that μ . So, what we have shown is the following namely that μ .

(Refer Slide Time: 06:22)

The whiteboard shows the following steps for the proof:

$$\mu\left(\bigcup_{i=1}^{\infty} A_i\right) \leq \sum_{i=1}^{\infty} \mu(A_i)$$

$$A \subseteq \bigcup_{i=1}^{\infty} A_i$$

$$\Rightarrow A = \bigcup_{i=1}^{\infty} (A \cap A_i)$$

$$\Rightarrow \mu(A) = \mu\left(\bigcup_{i=1}^{\infty} (A \cap A_i)\right)$$

$$\leq \mu\left(\bigcup_{i=1}^{\infty} A_i\right)$$

$$\leq \sum_{i=1}^{\infty} \mu(A_i)$$

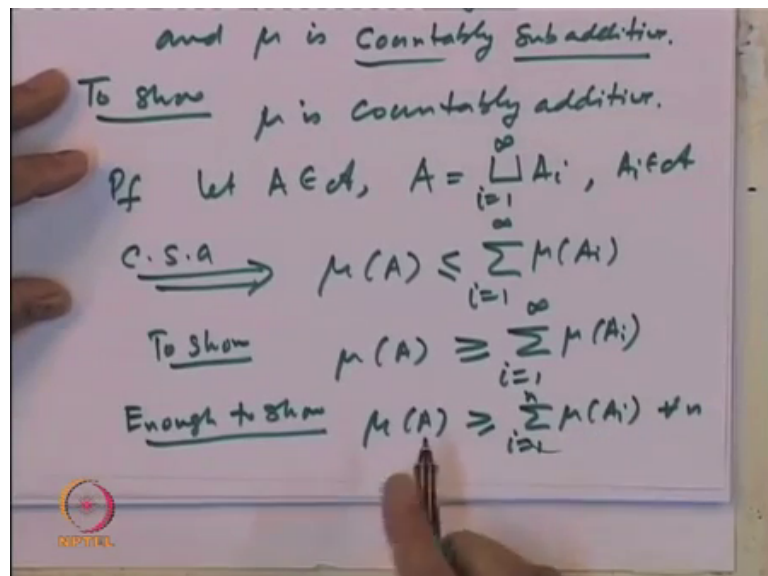

A hand is visible at the bottom right holding a pen, and a small logo is in the bottom left corner of the whiteboard.

Of union A_i i equal to 1 to infinity is less than or equal to sigma i equal to 1 to infinity μ of A_i right. And now we just want to conclude that in fact, μ of A is less than or equal to this quantity.

So, now let us observe A is a subset of union A_i . So, this implies I can write A is equal to union of A intersection A_i , i equal to 1 to infinity. Right I can just intersect and then this is an equality so; that means, μ of A is equal to μ of union i equal to 1 to infinity A intersection A_i and this is less than or equal to because this is this union is a subset of the union. So, this is less than μ of union i equal to 1 to infinity of A_i s because each one is a subset of this. So, this union is subset of this, and now from here this is less than or equal to μ of summation i equal to 1 to infinity of μ of A_i . So, we have shown that whenever A is an element in the algebra is a subset of union of A_i s i equal to 1 to infinity then μ of A is less than or equal to summation μ of A_i s.

So, that proves that μ is countably sub additive. So, we have shown if μ is countably additive then this implies μ is finitely additive and also μ is countably sub additive. So, that completes one part of the proof, let us prove the other way round implication namely. So, we want to show. So, assume.

(Refer Slide Time: 08:34).

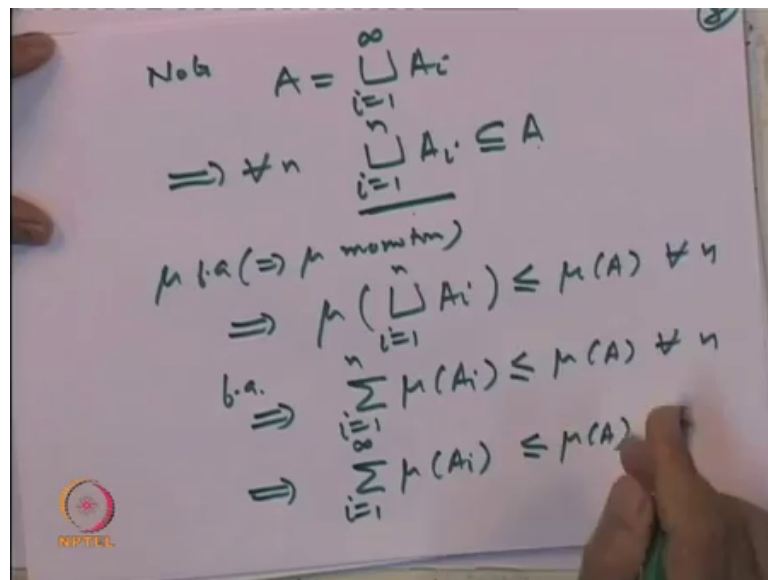

μ is finitely additive and μ is countably sub additive. To show μ is countably additive. So, let us chose the proof. So, how to prove countable additivity what is show

let a belong to algebra and a be equal to disjoint union a_i i equal to 1 to infinity a_i belonging to algebra. And we have to show μ of a is summation μ of a_i s.

Now, by countable additive countable sub additive property which is given to us this implies countable sub additive implies that μ of a is at least less than or equal to $\sum_{i=1}^{\infty} \mu$ of A_i s. So, countable sub additivity implies this fact there is less than or less equal to this. So, we have to prove only the other way. So, to show that μ of a is also greater than or equal to $\sum_{i=1}^{\infty} \mu$ of A_i right. So, this is what we have to show and note. So, here is a small observation to show this enough to show it is enough to show that μ of a is bigger than or equal to $\sum_{i=1}^n \mu$ of A_i for every n . So, if you can show for every n μ of a is bigger than or equal to this, then it also will be true for i equal to 1 to infinity because this is nothing, but limit of this partial sums.

So, this is enough to show. So, we have to only show that μ of a is bigger than or equal to $\sum_{i=1}^n \mu$ of a_i i equal to 1 to n and to show that let us observe. So, note.

(Refer Slide Time: 11:06)

That a equal to union a_i , i equal to 1 to infinity implies for every n the union A_i , i equal to 1 to n is a subset of a for every n right and we are in algebra. So, this set is in the algebra this is in the algebra μ finitely additive implies μ monotone. And hence implies that μ of the union A_i i equal to 1 to n will be less than or equal to μ of a for every n , but again by finite additivity this is nothing, but $\sum_{i=1}^n \mu$ of A_i

is less than or equal to μ of a for every n and this is happening for every n . So, this implies we can let n go to infinity.

So, n equal to 1 to infinity μ of A_i is less than or equal to μ of a . So, that proves the other around inequality also of the required thing. So, this proves this. So, that proves that μ is countably additive. So, what we have proved is the following namely. So, we have given a characterization.

(Refer Slide Time: 12:34)

Set functions on algebras

- (ii) If μ is finitely additive, then μ is also monotone.
- (iii) Let $\mu(\emptyset) = 0$. Then μ is countably additive iff μ is both finitely additive and countably sub additive.

■ Another characterization of countable additivity of set functions defined on algebras is given in the next theorem.

 NPTEL

© 2008 NPTEL. All rights reserved.

Of countable additive property of set functions which are finitely additive. So, if μ of empty set is equal to 0 then μ is countably additive if and only if. So, note here if and only if we have proved both ways. So, if and only if μ is both finitely additive and countably sub additive. So, this is a characterizations of countably additiveness additiveness of set functions, but of course, the domain of the set function should be an algebra that is important. So, this is a very useful criterion for accountable additivity.

We will prove another characterization of countable additivity of set functions in terms of a limits increasing and decreasing limits. So, that is given in the we will state next theorem, but again that theorem is again about set functions defined on algebras. So, the theorem says the following.

(Refer Slide Time: 13:42)

Set functions on algebras

- Let \mathcal{A} be an algebra of subsets of a set X and let $\mu : \mathcal{A} \rightarrow [0, \infty]$ be finitely additive and $\mu(\emptyset) = 0$. Then μ is countably additive if and only if the following hold: For any $A \in \mathcal{A}$,

$$\mu(A) = \lim_{n \rightarrow \infty} \mu(A_n),$$

whenever $A_n \in \mathcal{A}$ are such that $A_n \subseteq A_{n+1} \forall n$ and $A = \bigcup_{n=1}^{\infty} A_n$.

 NPTEL

© 2009 by Prof. J. J. Oxtoby. All rights reserved.

Let \mathcal{A} be an algebra of subsets of a set X and μ be finitely additive and with the property of course, μ of empty set is equal to 0. Then we want to prove that μ is countably additive if and only if once again it is a characterization if and only if the following property holds and the property says for any element A in the algebra \mathcal{A} we should have $\mu(A) = \lim_{n \rightarrow \infty} \mu(A_n)$, what are A_n whenever A_n is a sequence of sets in the algebra which is increasing. So, A_n is a subset of A_{n+1} for every n the sequence A_n should be increasing and A should be the union of all A_n ; that means, A_n are increasing sequence of sets in the algebra and A is the union of all these sets A_n .

So, this is a characterization of countable additiveness of the set function μ provided, one can prove the following. For any set A and for any sequence A_n of sets in the algebra which is increasing and A is the union we should have $\mu(A) = \lim_{n \rightarrow \infty} \mu(A_n)$. So, let us prove this property once again. So, to prove this what we have to show.

(Refer Slide Time: 15:15)

First let us prove. So, let μ be countably additive. So, let μ be countably additive. To show we have to show the following let take a set A belonging to the algebra take a sequence a_n belonging to the algebra such that A_n is sub set of A_{n+1} and a is equal to union of a_n we should show that μ of a is equal to limit n going to infinity μ of a_n . So, that is what is to be shown. So, let us now let us observe a is union of a_n , and we are given something about countable additivity. So, the obvious thing is try to write this union has a countable disjoint union.

So, we do that. So, proof let b_n we defined as A_n minus union a_i , i equal to 1 to $n-1$ for every n bigger than or equal to 1. Then as as observed earlier each b_n belongs to the algebra b_n are disjoint and a which is union of a_n is also equal to union of b_n of course, this is disjoint. So, let me write that equal to this. So, implies by countable additive property μ of a is equal to μ of this union b_n , and that is equal to by countable additive property that is summation n equal to 1 to infinity μ of b_n . So, that is by countable additive property and now, but we do not want b_n we want something in terms of a_n .

(Refer Slide Time: 17:45)

The image shows a whiteboard with handwritten mathematical equations. The equations are as follows:

$$\begin{aligned} &= \sum_{n=1}^{\infty} \mu(B_n) \\ &= \lim_{k \rightarrow \infty} \sum_{n=1}^k \mu(B_n) \\ &= \lim_{k \rightarrow \infty} \left(\mu \left(\bigcup_{n=1}^k B_n \right) \right) \\ &= \lim_{k \rightarrow \infty} \left(\mu \left(\bigcup_{n=1}^k A_n \right) \right) \\ &= \lim_{k \rightarrow \infty} \left(\mu(A_k) \right) \end{aligned}$$

A hand is visible on the right side of the whiteboard, holding a green marker. In the bottom left corner, there is a small logo for NPTEL. In the top right corner, the number '10' is written inside a circle.

So, here is an observation this summation I can write as limit k going to infinity of the partial sums. So, n equal to 1 to k of $\mu(B_n)$, but B_n s are disjoint. So, this is same as limit k going to infinity of μ of union B_n n equal to 1 to k because B_n s are disjoint by finite additive property this must be true and we are one. So, note once again because μ is given to be countable additive and hence it is finite additive and by finite additive property this is true. And this is and now the observation is that the union of B_n s n equal to 1 to k is same as the union of A_n s.

So, this is same as k going to infinity μ of union A_n n equal to 1 to k , but note we are not use anywhere the fact that A_n s are increasing. So, in since A_n s are increasing what is this union this union is precisely μ of the largest set that is A_k . So, that is μ of A_k . So, what we are shown is that μ of A is limit of μ of A_k is going to infinity, whenever A_n is a sequence which is increasing whenever A_n s is increasing and A is equal to union. So, we have proved one way countable additivity implies the required property let us look at the converse. So, conversely.

(Refer Slide Time: 19:40)

Set functions on algebras

- Let \mathcal{A} be an algebra of subsets of a set X and let $\mu : \mathcal{A} \rightarrow [0, \infty]$ be finitely additive and $\mu(\emptyset) = 0$. Then μ is countably additive if and only if the following hold: For any $A \in \mathcal{A}$,

$$\mu(A) = \lim_{n \rightarrow \infty} \mu(A_n),$$

whenever $A_n \in \mathcal{A}$ are such that $A_n \subseteq A_{n+1} \forall n$ and $A = \bigcup_{n=1}^{\infty} A_n$.

So, let us assume μ has.

(Refer Slide Time: 19:43)

$\Leftarrow \mu$ has the given property

To show μ is c.a., i.e.

$$A = \bigsqcup_{n=1}^{\infty} A_n, \quad A, A_n \in \mathcal{A}.$$

$$= \bigcup_{k=1}^{\infty} \left(\bigsqcup_{n=1}^k A_n \right)$$

Given hypothesis \Rightarrow

$$\begin{aligned} \mu(A) &= \lim_{k \rightarrow \infty} \mu(B_k) \\ &= \lim_{k \rightarrow \infty} \mu\left(\bigsqcup_{n=1}^k A_n\right) \\ &= \lim_{k \rightarrow \infty} \left(\sum_{n=1}^k \mu(A_n) \right) \\ &= \sum_{n=1}^{\infty} \mu(A_n). \end{aligned}$$

The given property and what is the given property.

Given property says whenever a set A is written as union of A_n where A_n are increasing then μ of A is equal to μ of the union. So, we want to prove to show. So, to show μ is countably additive that is let us take a set A which is disjoint union of sets A_n n equal to 1 to infinity where A and all A_n are in the algebra right. We have to show that μ of A is

equal to summation μ of a_n s, but this I can write it as union over k one to infinity $\bigcup_{n=1}^k a_n$.

So, take instead of taking n equal to 1 to infinity take union of sets a_1, a_2, \dots, a_k and then take the union over k both will be same right, but the advantage of this way is now if you call this as b_k then b_k is a set in the algebra, because it is a finite union of sets in the algebra b_k is increasing because we are taking union of more and more sets and there union is equal to a . So, by the given property. So, by the given hypothesis μ of a is equal to limit k going to infinity μ of b_k .

And now let us go back to represent b_k as in terms of a s. So, that is limit k going to infinity μ of $\bigcup_{n=1}^k a_n$. And now we use the fact that μ is finitely additive. So, this is limit k going to infinity summation $n=1$ to k of μ of a_n s and which is same as sigma one to infinity of μ of a_n s. So, that says whenever a is a disjoint union of countable disjoint union of sets in the algebra μ of a is μ of sigma μ of a_n s and that is countable additive property of the set function. So, we have proved theorem completely namely if \mathcal{a} is an algebra of subsets of a set x and μ is finitely additive with that property then μ is countably additive if and only if μ has the property that μ of a is the limit of μ of a_n s whenever A_n is increasing and A_n is equal to union of a sets.

So, this is characterizing countable additivity in terms of limits of increasing sequence of sets and this property one says that μ is continuous from below at the point a . So, countable additivity for finitely additive set functions is same as saying they are continuous from below at the point a from below because a is union of these sets. So, from below there is a corresponding result for sequences which are decreasing. So, let us state that result and prove it also.

(Refer Slide Time: 23:34)

Set functions on algebras

- Let \mathcal{A} be an algebra of subsets of a set X and let $\mu : \mathcal{A} \rightarrow [0, \infty]$ be finitely additive such that $\mu(\emptyset) = 0$ and $\mu(X) < \infty$. Then μ is countably additive if and only if the following hold: For any $A \in \mathcal{A}$,

$$\mu(A) = \lim_{n \rightarrow \infty} \mu(A_n),$$

whenever $A_n \in \mathcal{A}$, $n \geq 1$ is such that $A_{n+1} \subseteq A_n \forall n$ and $A = \bigcap_{n=1}^{\infty} A_n$.

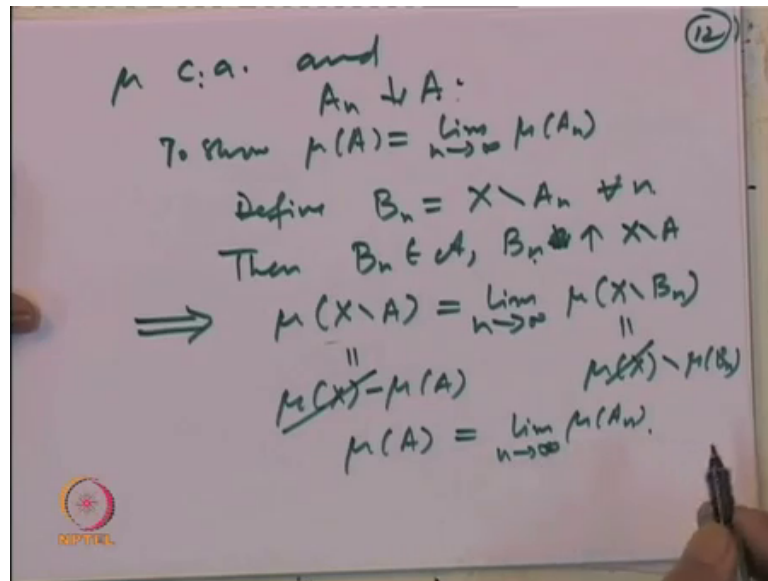

© Center for Research and Education, 1999

that if \mathcal{A} is an algebra of subsets of a set X and μ is finitely additive. So, that conditions are same as it, plus we want additional condition that μ of the whole space is finite. So, this is a additional condition put to prove to state the result namely μ of the whole space is finite. So, it says μ is countably additive if and only if the following holds namely for any set A in \mathcal{A} whenever μ of A is equal to limit n going to infinity μ of A_n and whenever A_n s are decreasing.

So, A_{n+1} is subset of A_n and A is the intersection we says. So, countable additivity is equal to saying for every set A in the algebra if A is intersection of a decreasing sequence of sets A_n s then μ of A must be equal to limit of A_n s and the proof of this uses the earlier theorem. So, let us assume μ is countably additive and A_n s decrease to A .

(Refer Slide Time: 24:45)

All in the algebra \mathcal{a} , to show we want to show that μ of A is equal to μ of A_n s to show μ of A is limit n going to infinity μ of A_n . Now we know something about increasing sequences. So, from decreasing we want to manufacture an increasing sequence and that is done via complements. So, define B_n to be equal to X minus A_n for every n then B_n each B_n belongs to the algebra \mathcal{a} B_n is decreasing because A_n s are B_n s are sorry increasing as A_n s are decreasing and where do they decrease. So, they B_n s increase to X minus A because A_n s are decreasing to A .

So, by the earlier theorem we have. So, countable additivity implies whenever a sequence is increasing μ of X minus A must be equal to limit n going to infinity μ of X minus B_n , but now we use the fact that μ of X is finite. So, this is same as μ of X minus μ of A and this thing is equal to μ of X minus μ of B_n . And this is possible only because we have the fact that μ of the whole space is finite. So, everything is a finite quantity and we have already shown μ of the difference is equal to difference of μ 's provided the things are finite. So, this is equal to limit of this. So, now, X cancels negative sign. So, limit. So, μ of A is equal to limit μ of A_n s n going to infinity. So, this is countable additivity implies this the other way round property. So, let us assume this as the property that whenever A_n s increase.

(Refer Slide Time: 27:06)

μ has a given prop. (13)
 To show μ is c.a.
 $A = \bigsqcup_{i=1}^{\infty} A_i = \bigcup_{n=1}^{\infty} \left(\bigcup_{i=1}^n A_i \right)$
 $X \setminus A = \bigcap_{i=1}^{\infty} \left(X \setminus \bigcup_{i=1}^i A_i \right)$
 $= \bigcap_{i=1}^{\infty} (B_n)$
 $\mu(X \setminus A) = \lim_{n \rightarrow \infty} \mu(B_n)$
 $\mu(X) - \mu(A) = \mu(X) - \lim_{n \rightarrow \infty} \sum_{i=1}^n \mu(A_i)$
 $= \sum_{i=1}^{\infty} \mu(A_i)$

So, μ has required a given property to show μ is countably additive. So, let us take a set A equal to a disjoint union A_i 's. Then this is what is X minus A that is intersection of X minus A_i for i equal to 1 to infinity. So, let us write this as union of B_n for n equal to 1 to infinity. B_n is X minus union of A_i for i equal to 1 to n . So, these are the sets. So, then it is X minus union of A_i for i equal to 1 to n . So, that is equal to intersection B_n for n equal to 1 to infinity. So, these are the sets. So, then it is X minus union of A_i for i equal to 1 to n . So, that is equal to intersection B_n for n equal to 1 to infinity. So, let us call this has a set B_n . So, let us call this has B_n right. So, now, note B_n 's are decreasing and they are in the algebra because the A_n 's are union n this will be increasing. So, this will be decreasing. So, μ of X minus A by the given hypothesis is limit n going to infinity μ of B_n 's. And what is μ of B_n μ of B_n is X minus this.

So, that is equal to μ of X minus. So, limit n going to infinity μ of the union that is this disjoint. So, summation i equal to 1 to n μ of A_i 's and this thing is equal to μ of X minus μ of A because everything is finite. So, this cancels with this. So, μ of A is limit of this, which is equal to summation one to infinity μ of A_i 's. So, that proves countable additivity. So, we have proved that when μ is countably μ is countably additive if and only if for a decreasing sequence of sets A_n equal to this intersection μ of A is the limit under the condition μ of X is finite. So, this is important this condition cannot be removed that is the. Next so, this kind of thing is called continuity from above and here is a remark that the condition μ of X is finite is necessary in the second part and cannot be removed. So, that we will request you to construct an example you can construct a

very easily an example on the real line with length function has the set function. And here is an exercise for you to do that is finitely such that μ of is finite. So, last part we said An decreasing to a that you can actually reduce a bit says whenever a n s are decreasing to empty set that is also equivalent to saying that μ is countable additive. So, these 2 parts we will like you to explore and understand and answer this questions. So, thank you let us stop to it.

Thanks.
