**Properties of measurable sets**

- $E \in S^*$  if and only if For every  $Y \subseteq X$ , with  $\mu^*(Y) < +\infty$ ,  
$$\mu^*(Y) \geq \mu^*(Y \cap E) + \mu^*(Y \cap E^c).$$
- $\mathcal{A} \subseteq S^*$ , i.e., every element of  $\mathcal{A}$  is measurable.
- A set  $E$  is measurable iff  $E^c$  is measurable, i.e.,  
$$E \in S^* \text{ iff } E^c \in S^*.$$

 © Inder K. Rana of Bombay ... 1998

So, we are going to now understand the properties of this class  $S^*$ ; what are the properties of this collection of measurable sets? So, the first observation is that every set in the given algebra is measurable; that means, if  $A$  belongs to the algebra  $\mathcal{A}$ ; then this condition is always going to be true; so let us verify that.

(Refer Slide Time: 00:46)

So, let us show that if a belongs to the algebra then A is measurable and that is for every Y is sub set of X with mu star of Y finite; we should have mu star of Y is bigger than or equal to mu star of Y intersection A; the set is A. So, Y intersection A; plus mu star of Y intersection A compliment.

So, this is what we have to show, so let us look at the proof of this. Now, we are going to use the fact that mu star of Y is finite and mu star of Y finite means that it is a infimum of some quantities. So, that crucial definition what is definition of infimum; we are going to use. So, let epsilon greater than 0 be fixed; then by definition of infimum; there exists a covering. So, there exist sets A i belonging to A with the fact that the set Y is covered by union of A i's; i equal to 1 to infinity.

And mu star of Y which is infimum plus a small number does not remain the infimum. So, it is bigger than or equal to mu of A i; i equal to 1 to infinity. So, here we are using the fact that mu star of Y is infimum and that is a finite quantity. Now, A i's are in the algebra; A is in the algebra. So, I can write this as this is equal to sigma i equal to 1 to infinity; mu of; union of A i's intersection A; the set is A; 1 to infinity union of the sets; union i equal to 1 to infinity; A i intersection a compliment.

So, what I am saying is; not the union this is wrong. So, let me just simply write it as; so, let us observe what we are saying; we are saying because of this each set A i.

(Refer Slide Time: 03:45)

Handwritten notes on a whiteboard:

$$\Rightarrow \mu(A_i) = \mu(A_i \cap A) + \mu(A_i \cap A^c)$$

$$\sum_{i=1}^{\infty} \mu(A_i) = \sum_{i=1}^{\infty} \mu(A_i \cap A) + \sum_{i=1}^{\infty} \mu(A_i \cap A^c) \rightarrow$$

Next

$$A \cap Y \subseteq \bigcup_{i=1}^{\infty} (A_i \cap A)$$

$$A^c \cap Y \subseteq \bigcup_{i=1}^{\infty} (A_i \cap A^c)$$

$$\Rightarrow \mu^*(A \cap Y) \leq \sum_{i=1}^{\infty} \mu(A_i \cap A) \rightarrow$$

$$\mu^*(A^c \cap Y) \leq \sum_{i=1}^{\infty} \mu(A_i \cap A^c) \rightarrow$$

So, let us note  $A_i$ ; I can write as  $A_i$  intersection  $A$ ; union  $A_i$  intersection  $A$  compliment. And these are two disjoint sets and  $\mu$  is a measure; all the  $A_i$ 's,  $A$  everything is in the algebra. So, using the fact that  $\mu$  is a measure; I can write it as. So, implies that  $\mu$  of  $A_i$  is equal to  $\mu$  of  $A_i$  intersection  $A$ ; plus  $\mu$  of  $A_i$  intersection  $A$  compliment.

So, now  $\mu$  of  $A_i$  intersection  $A$  compliment so; that means, summation  $\mu$  of  $A_i$ ;  $i$  equal to 1 to infinity is equal to summation  $i$  equal to 1 to infinity,  $\mu$  of  $A_i$  intersection  $A$  plus summation  $i$  equal to 1 to infinity;  $\mu$  of  $A_i$  intersection  $A$  compliment. And now let us note that the set  $A$  intersection;  $Y$  is covered by union of  $A_i$  intersection  $A$ ;  $i$  equal to 1 to infinity.

Because  $Y$  is covered by union of  $A_i$ 's; so,  $A$  intersection  $Y$  is covered by this and  $A$  compliment intersection  $Y$  is covered by union of  $i$  equal to 1 to infinity;  $A_i$  intersection  $A$  compliment. And these are sets in the algebra because  $A$  belongs to the algebra that is a crucial thing. So, this will imply that  $\mu^*$  of  $A$  intersection  $Y$  is less than or equal to summation of  $\mu$   $A_i$  intersection;  $A$  compliment  $i$  equal to 1 to infinity and  $\mu^*$  of the second one gives me,  $A$  compliment intersection  $Y$  is also a sub is less than or equal to using this summation  $i$  equal to 1 to infinity;  $\mu$  of  $A_i$  intersection  $A$  compliment.

So, look at this equation, look at this equation, look at this equation, so  $\mu^*$  or summation  $\mu^*$  of  $A_i$ 's is bigger than this sum and that sum is bigger than or equal to

$\mu^*$  of  $A$  intersection  $Y$ ; and this sum is bigger than or equal to  $\mu^*$  of  $A$  intersection  $Y$ ;  $Y \cap A^c$  intersection  $Y$ .

And we had  $\mu^*$  of  $Y$  plus epsilon was bigger than this summation. So, that summation; so, putting this three equations together; so, if we call that earlier equation as 1, call this equation as 2, call this equation as 3 and call this equation as 4.

(Refer Slide Time: 06:53)

$$\begin{aligned} \mu^*(Y) + \epsilon &\geq \sum_{i=1}^{\infty} \mu^*(A_i) \\ &\geq \sum_{i=1}^{\infty} \mu^*(A_i \cap A) + \sum_{i=1}^{\infty} \mu^*(A_i \cap A^c) \\ &\geq \mu^*(Y \cap A) + \mu^*(Y \cap A^c) \end{aligned}$$

$\epsilon$  is arbitrary. Let  $\epsilon \rightarrow 0$

$$\Rightarrow \mu^*(Y) \geq \mu^*(Y \cap A) + \mu^*(Y \cap A^c)$$

$\Rightarrow A \in \mathcal{S}^*$   
 $\mathcal{A} \subseteq \mathcal{S}^*$

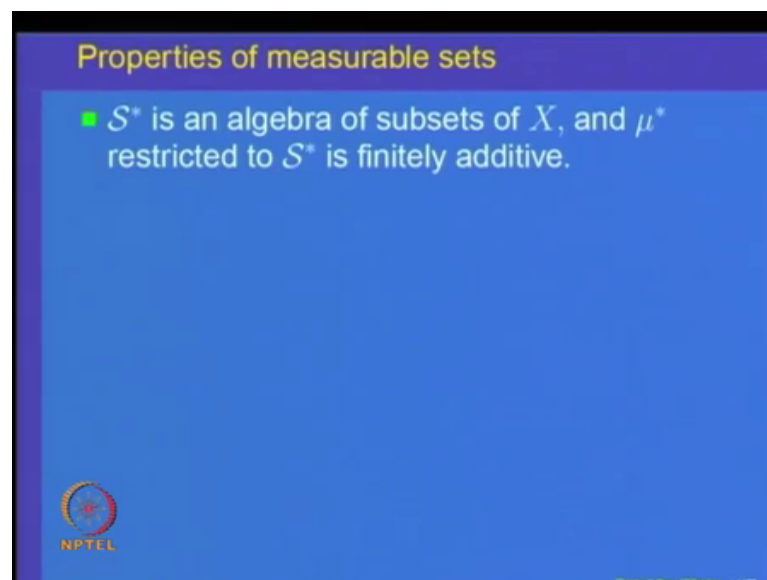

Then putting all this four equations together; what we have is the following that  $\mu^*$  of  $Y$  plus epsilon; which was bigger than or equal to summation  $\mu^*$  of  $A_i$ ;  $i$  equal to 1 to infinity, that is equal to actually summation of  $\mu^*$  of  $A_i$  intersection;  $A_i$  equal to 1 to infinity, plus 1 to infinity  $\mu^*$  of  $A_i$  intersection;  $A_i$  complement and that is bigger than or equal to  $\mu^*$  of  $Y$  intersection  $A$ ; plus  $\mu^*$  of  $Y$  intersection  $A$  complement.

And now epsilon is arbitrary; so let epsilon go to 0. So, this inequality will be still maintained will imply that;  $\mu^*$  of  $Y$  is bigger than or equal to  $\mu^*$  of  $Y$  intersection  $A$ ; plus  $\mu^*$  of  $Y$  intersection  $A$  complement and that will imply that  $A$  belongs to  $\mathcal{S}^*$  that is  $A$ ; is a measurable set. So, hence we have proved that the algebra  $\mathcal{A}$  is included in the collection  $\mathcal{S}^*$ ; that is what we wanted to prove. So, this is the proof of the fact that the algebra  $\mathcal{A}$  is contained in  $\mathcal{S}^*$ ; every element of  $\mathcal{A}$  is measurable.

The next property that the class of measurable sets is closed under complementation namely; if  $E$  is measurable then  $E$  complement is may also measurable, that is obvious because in this criteria if you want to check if  $E$  is measurable; then this is what we required. And to check  $E$  compliment is measurable the same thing is required because this will become  $E$  compliment and  $E$  compliment of compliment is  $E$ . So, it is the same criteria; same equation to be verified.

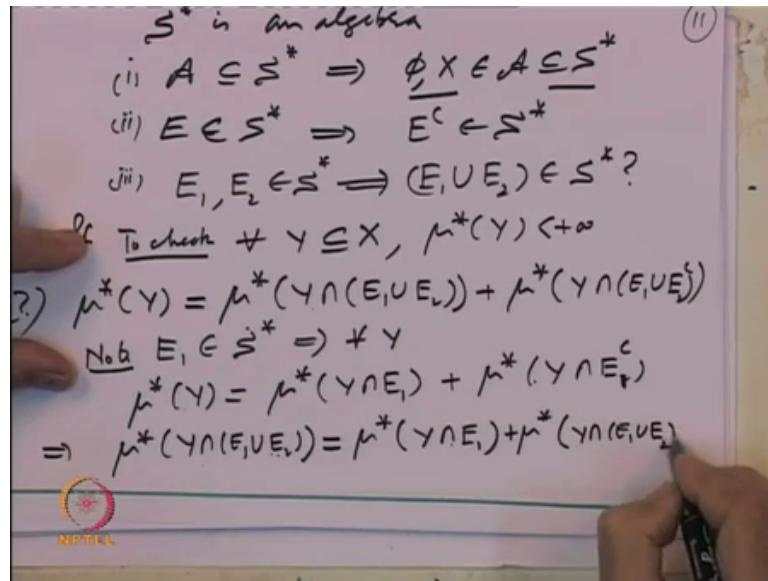

So; obviously, because the definition has inbuilt  $E$  and  $E$  compliment symmetric with respect to  $E$  and  $E$  compliment; that says the set  $E$  is a set is measurable if and only if its compliment is measurable. Or the collection  $S$  star of measurable sets is closed under compliments.

(Refer Slide Time: 09:21)

Next, we want to check the property. So, the collection of all measurable sets  $S^*$ ; it includes the class of all sub sets in the original algebra  $A$  and we want to check now that it is an algebra of sub sets of  $X$ ; that means, and  $\mu^*$  restricted to  $S^*$  is finitely additive. So, two things we want to check; one  $S^*$  is an algebra and  $\mu^*$  restricted to  $S^*$  is finitely additive. So, let us see what we have to check for this.

(Refer Slide Time: 09:57)

So, first of all we want to check that  $S^*$  is an algebra. We have already shown  $A$  is inside  $S^*$ , so that implies implying the empty set and the whole space that belong to  $A$  and hence  $A$  is in  $S^*$ . So, empty set and the whole space belong to it; we just now observed that  $E$  belonging to  $S^*$ ; implies  $E$  complement belongs to  $S^*$ . So, if  $E$  is measurable;  $E$  complement is measurable that also we have checked.

So, let us check the third property namely; if  $E_1$  and  $E_2$  belong to  $S^*$ , we want to check this implies  $E_1 \cup E_2$ ; also belongs to  $S^*$ . That means union of measurable sets is again measurable, so this is what we want to check. So, let us look at a proof of this to; so, to check that  $E_1, E_2$  is measurable; we have to check for every  $Y$  contained in  $X$   $\mu^*$  of  $Y$  finite.

We have to check that  $\mu^*$  of  $Y$  can be written as  $\mu^*$  of  $Y$  intersection; the set that is  $E_1 \cup E_2$ ; plus  $\mu^*$  of  $Y$  intersection  $E_1 \cup E_2$  complement. So, this is the property that we have to check. So, what we will do is we will compute each one of the term and show it is equal to  $\mu^*$  of  $Y$ . So, for that we start; so, note  $E_1$  is measurable so, that implies that  $\mu^*$  of  $Y$ ; we can write as  $\mu^*$  implies, for every  $Y$ ;  $\mu^*$  of  $Y$  is  $\mu^*$  of  $Y$  intersection  $E_1$  plus;  $\mu^*$  of  $Y$  intersection  $E_2$ .

And now this is important that this happens for every  $Y$ . So, I can change  $Y$  according to my requirements. So, what I want to do is; I will change this  $Y$  to  $Y$  intersection  $E_1$ ; see I want to compute  $Y$  intersection  $E_1 \cup E_2$ . So, let us change it this  $Y$  to that. So,

be? That is going to be  $\mu^*$  of  $Y \cap E_2^c$  by using our popular Demorgan's laws for set theory; this is  $E_1^c \cap E_2^c$ . So, I want to compute  $\mu^*$  of  $E_1^c \cap E_2^c$ . How can we compute that?

Recall saying that  $E_1$  was measurable we had that. So, if I replace  $Y$  by  $Y \cap E_2^c$ , then I will get the required set here. So, use this equation; so, since  $E_1$  is measurable we have  $\mu^*$  of  $Y$ . So, we will just keep it here to follow. So,  $\mu^*$  of  $Y \cap E_2^c$  I want; instead of this we want  $Y \cap E_2^c$ . So, let us look at  $Y \cap E_2^c$  is equal to  $\mu^*$  of  $Y \cap E_2^c$ ;  $E_1 \cap E_2^c$  plus  $\mu^*$  of what will be this set  $Y \cap E_2^c \cap E_1^c$ ; so, that is what we will have.

So, this is what I wanted; now let us observe in this equation; all the numbers are real numbers. Because of the assumption that  $\mu^*$  of  $Y$  is finite; so this is a sub set. So, this is finite, this is finite, this is finite all are finite numbers. So, I can interchange them; I can take one term on the other side if required, so let us do that.

So, from here we compute; so, implies  $\mu^*$  of  $Y \cap E_1^c$ ;  $E_1^c \cap E_2^c$ . This set is equal to  $\mu^*$  of  $Y \cap E_2^c$  minus; take it on the other side it is  $\mu^*$  of  $Y \cap E_1 \cap E_2^c$ . So, we have gotten the required quantities; so, we wanted  $\mu^*$  of; we wanted what is  $\mu^*$  of  $Y \cap E_1 \cup E_2$ . So, that is lying here and we wanted that is lying here the second term.

So, let us add these two terms. So, add call it as this equation as 1, call this equation as 2; add 1 and 2 and that will give you; that  $\mu^*$  of  $Y \cap E_1 \cup E_2$  plus  $\mu^*$  of  $Y \cap E_1^c \cap E_2^c$ . So, this is equal to; there we have got  $\mu^*$  of  $Y \cap E_1$  plus  $\mu^*$  of  $Y \cap E_2$  intersection  $E_1^c$  plus  $\mu^*$  of  $Y \cap E_2^c$ ; minus  $\mu^*$  of  $Y \cap E_1 \cap E_2^c$ .

So, this is what we have gotten and we want to check that this should come out to be equal to  $\mu^*$  of  $Y$ . Now, let us again try to use; so, this is  $\mu^*$  of intersection  $E_2^c$  here and that is  $E_1 \cap E_2^c$ . Now, let us observe till now we have not use anywhere the fact that  $E_2$  is measurable. So, let us try to use that fact that  $E_2$  is also measurable and so, that we can simplify this quantity.

(Refer Slide Time: 19:46)

$$\begin{aligned} \Rightarrow \mu^*(Y) &= \mu^*(Y \cap E_2) + \mu^*(Y \cap E_2^c) \\ \Rightarrow \mu^*(Y \cap E_1) &= \mu^*(Y \cap E_1 \cap E_2) + \mu^*(Y \cap E_1 \cap E_2^c) \\ -\mu^*(Y \cap E_1 \cap E_2^c) &= -\mu^*(Y \cap E_1) + \mu^*(Y \cap E_1 \cap E_2) \\ \} &= \mu^*(Y \cap E_1) + \mu^*(Y \cap E_1 \cap E_2) - \mu^*(Y \cap E_1) \\ &= \mu^*(Y \cap E_1 \cap E_2) + \mu^*(Y \cap E_1 \cap E_2^c) \\ &= \mu^*(Y \cap E_1) \end{aligned}$$

So, now observe  $E_2$  measurable implies the following fact; we want to simplify this. So, let us look at what is going to be  $E_2$ ;  $Y \cap E_2$  and  $Y \cap E_2^c$  complement. So, let us try to  $E_2$  measurable means so, for every  $Y$ ; we have got  $\mu^*$  of  $Y$  is equal to  $\mu^*$  of  $Y \cap E_2$  plus  $\mu^*$  of  $Y \cap E_2^c$  complement.

Because, as a measurability; now I want to use this to compute one of the terms here. So, let us replace  $Y$  by  $Y \cap E_2$ . So, that implies I can replace this by  $\mu^*$  of  $Y \cap E_2$  will be equal to; that will not give us anything. Let us replace this by  $Y \cap E_1$ , so implies  $\mu^*$  of  $Y \cap E_1$  is equal to  $\mu^*$  of  $Y \cap E_1 \cap E_2$  plus  $\mu^*$  of  $Y \cap E_1 \cap E_2^c$  complement.

So, what is  $\mu^*$  of  $Y \cap E_1 \cap E_2^c$  that term is here. So, that we want with negative sign; so, if I take it on the other side so; that means, minus  $\mu^*$  of  $Y \cap E_1 \cap E_2^c$  is equal to; I bring it on the other side. So, that is minus  $\mu^*$  of  $Y \cap E_1 \cap E_2^c$  plus  $\mu^*$  of this term which is  $Y \cap E_1 \cap E_2$ . And now this; so, this is what we have reached here.

So, this is the value that I was looking for; so, let us put in this value. So, this required quantity; I will just take it here is equal to, so this required quantity is equal to  $\mu^*$  of

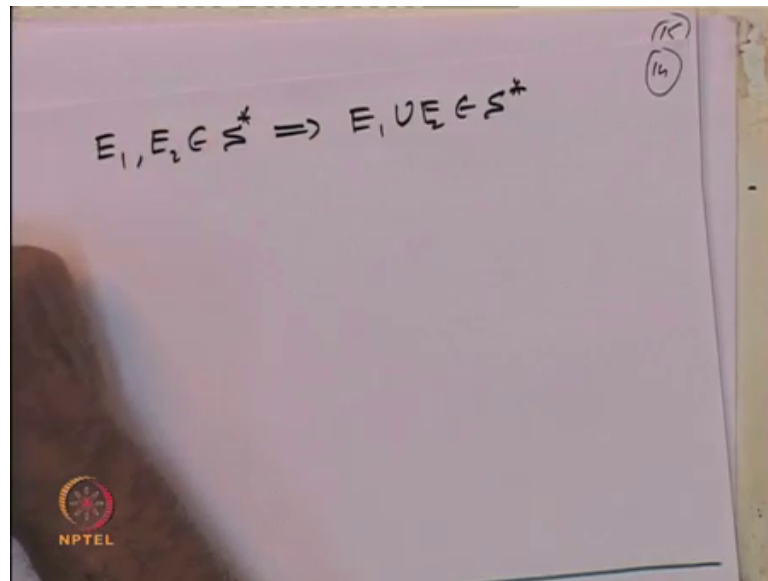

Y and here is minus  $\mu^*$  of Y; so, those two terms will cancel out. So, let me just write that is  $\mu^*$  of Y intersection E 1 plus  $\mu^*$  of Y intersection E 2; intersection E 1 compliment; that we already had.

So, plus  $\mu^*$  of Y intersection E 2 compliment and minus; so, that is equal to minus  $\mu^*$  of; from here Y intersection E plus  $\mu^*$  of Y intersection E 1; intersection E 2 and now this two terms cancel out. So, what we are left with is; so, this is equal to  $\mu^*$  of Y intersection E 2; intersection E 1 compliment. And Y intersection E 2 intersection E 1, so look at these two terms. So, these two terms this Y intersection E 2; intersection E 1 compliment plus Y  $\mu^*$  of Y intersection E 1 and E 2; so; that means so these two terms are nothing, but  $\mu^*$  of Y intersection E 2.

So, and one term is here; so, this is  $\mu^*$  of Y intersection E 2 plus what I am saying is this plus this term is nothing, but  $\mu^*$  of Y. So, this is compliment  $\mu^*$  of Y intersection E 2; is that clear? This term as it is; now look at that fact that E 1 is measurable. So,  $\mu^*$  of Y intersection E 2 is  $\mu^*$  of Y intersection E 2; intersection E 1 compliment, plus  $\mu^*$  of Y intersection E 1 intersection E 2.

And now once again using the fact that E 2 is measurable that is equal to  $\mu^*$  of Y. So, we have proved the required condition that  $\mu^*$  of Y is equal to  $\mu^*$  of Y. So, we have proved that this is  $\mu^*$  of Y is equal to  $\mu^*$  of Y intersection E 1 union E 2 plus  $\mu^*$  of Y intersection E 1 compliment; intersection E 2 compliment. So; that means, we have proved the fact that S is an algebra of sub sets of the set X.

(Refer Slide Time: 24:49)

$$E_1, E_2 \in \mathcal{S}^* \Rightarrow E_1 \cup E_2 \in \mathcal{S}^*$$

So, what we have shown is  $E_1, E_2$  belonging to  $\mathcal{S}^*$ ; imply  $E_1 \cup E_2$  also belong to  $\mathcal{S}^*$ . Here, let me just comment that this proof looks a bit technical, but it is not so difficult. Even measurable gives you one condition; that  $\mu^*$  of  $Y$  is equal to something,  $E_2$  measurable gives you  $\mu^*$  of  $Y$  is equal to something. Now, this sets  $Y$  are arbitrary and given  $E_1$  and  $E_2$  are measurable means  $\mu^*$  of  $Y$  is equal to  $\mu^*$  of  $Y \cap E_1$  plus  $\mu^*$  of  $Y \cap E_2$ ;  $E_1$  compliment.

So, you can change this  $Y$  to  $Y \cap E_1 \cap E_2$  and so on. So, write down the equations which are given; write down the equation, the equality that we proved and just manipulate this is only a simple algebra which is required. So, today what we have done is; we have looked at; we have defined the concept of what is called a measurable set for a outer measure  $\mu^*$ . And we have shown that the original elements of the algebra are already measurable sets and the class of all measurable sets form an algebra. So, we will continue the analysis of this class  $\mathcal{S}^*$  in our next lecture.

Thank you.
