Lecture – 11 A
Measurable Sets

Welcome to lecture 11 on measure and integration, in the previous lecture we had defined what is called a outer measurable sub set and we had started looking at the properties of the outer measurable sets. We will continue that study of properties of the outer measurable sets today and if time permits in the end we will specialize the case when this space is the real line. So, let us recall what we have been doing. So, properties of measurable sets we were looking at.

(Refer Slide Time: 00:52)

Measurable sets

- A set $E \subseteq X$ is said to be μ^* -measurable if for every $Y \subseteq X$,
$$\mu^*(Y) = \mu^*(Y \cap E) + \mu^*(Y \cap E^c).$$
- Denote by S^* the class of all μ^* -measurable subsets of X .
- $E \in S^*$ if and only if For every $Y \subseteq X$, with $\mu^*(Y) < +\infty$,
$$\mu^*(Y) \geq \mu^*(Y \cap E) + \mu^*(Y \cap E^c).$$

 NPTEL

Let us just recall what is outer measurable set, A sub set E of X was set to be outer measurable or mu star measurable, if mu star of any set Y is written as can be written as mu star of Y intersection E plus mu star of Y intersection E compliment. So, this condition must be satisfied for every sub set Y of X and then we said let us denote by S star the class of all mu star measurable sets and we gave A equivalent way of verifying when A set is outer measurable. So, the condition is that A set E is measurable if and only if for every sub set Y in X with mu star of Y finite, we have the condition that mu star of Y is bigger than or equal to mu star of Y intersection E, plus mu star of Y intersection E

compliment. So, instead of just saying that for every sub set Y this equality must be true we have to only verify for those sub sets Y of X for which mu star of Y is finite and instead of equality we have to verify only bigger than or equal to one way in equality because the other way around is always true for mu star being countably sub additive.

(Refer Slide Time: 02:18)

Properties of measurable sets

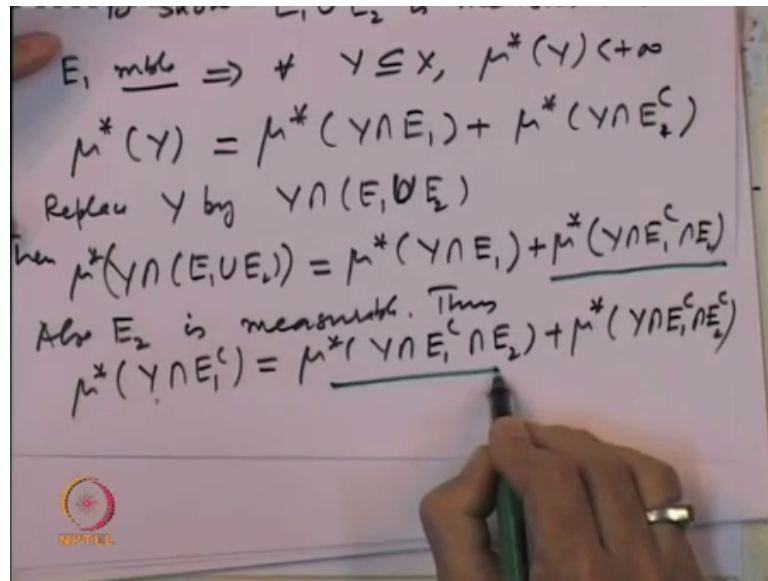

- If $A_n \in \mathcal{S}^*$, $n = 1, 2, \dots$, are pairwise disjoint, then $\bigcup_{n=1}^{\infty} A_n \in \mathcal{S}^*$ and

$$\mu^*\left(\bigcup_{n=1}^{\infty} A_n\right) = \sum_{n=1}^{\infty} \mu^*(A_n).$$

NPTEL

So, this condition we will use whenever we required and so means the first observation that we proved last time was that A is the given algebra on which the measure is defined. So, the first claim we proved that every element in the algebra is also a measurable set. So, A is sub set of S star, the second property that we were looking at was that if S star is, that S star is an algebra of sub sets of X and mu star restricted to S star is finitely additive, we had already observed that a set E is measurable if and only if its compliment is measurable. So, S star A is closed under compliments only we have to verify that it is closed under unions and that proof we are working out in the last time and we are d1 it, let us just revise it again because we are going to nu need those inequalities.

(Refer Slide Time: 03:20)

So, let us take let E_1 and E_2 be measurable sets to show that $E_1 \cup E_2$ is measurable. So, E_1 measurable implies that for every sub set Y contained in X and let us also have the expressional condition less than finite, we know that μ^* of Y is equal to μ^* of $Y \cap E_1$ plus μ^* of $Y \cap E_2^c$ sorry E_1 compliment, this is true for every sub set Y with that property let us replace Y by $Y \cap (E_1 \cup E_2)$.

So, replace this y so then we get so then what do we have? We have μ^* of $Y \cap (E_1 \cup E_2)$ is equal to. So, Y is replaced by $Y \cap (E_1 \cup E_2)$, but E_1 is a sub set of it. So, the first term is just μ^* of $Y \cap E_1$ plus the second term becomes μ^* of $(E_1 \cup E_2) \cap E_1^c$, the first term will give me only empty set, union $Y \cap E_2 \cap E_1^c$. So, $E_1^c \cap E_2$ so that is what we get by using the fact that E_1 is measurable also E_2 is measurable.

So, thus for every set Y a corresponding equation holds for E_2^c , but will replace Y by $Y \cap E_1^c$. So, so μ^* of $Y \cap E_1^c$ is equal to μ^* of $Y \cap E_1^c \cap E_2$ plus μ^* of $Y \cap E_1^c \cap E_2^c$. So, using the fact that E_2 is measurable we have written μ^* of $Y \cap E_1^c$ as the set intersection E_2 the set intersection E_2^c compliment now. So, in this 2 equations look at this set this term $Y \cap E_1^c$

complement intersection E_2 that is also sitting here. So, will compute the value of this and put it that equation. So, let us do that so from this second equation we put the value there so we have got so from this 2 equations.

(Refer Slide Time: 06:30)

Thus

$$\mu^*(Y \cap (E_1 \cup E_2)) = \mu^*(Y \cap E_1) + \mu^*(Y \cap E_1^c \cap E_2) - \mu^*(Y \cap E_1^c \cap E_2^c)$$

$$\Rightarrow \mu^*(Y \cap (E_1 \cup E_2)) + \mu^*(Y \cap E_1^c \cap E_2^c) = \mu^*(Y \cap E_1) + \mu^*(Y \cap E_1^c)$$

$$= \mu^*(Y)$$

$\Rightarrow E_1 \cup E_2$ is measurable.

$\nexists E_1, E_2$ are disjoint $E_1 \cap E_2 = \emptyset \Rightarrow E_2 \subseteq E_1^c$

So, thus μ^* of Y intersection E_1 union E_2 that is the left hand side of this equation, that is left hand side of this equation. So, that is equal to the first term. So, that is μ^* of Y intersection E_1 Plus Y intersection E_1 complement intersection E_2 is equal to μ^* of Y intersection E_1 minus that thing.

So, μ^* of Y intersection E_1 complement minus μ^* of Y intersection E_1 complement intersection E_2 complement and now I should note down note here that we have taken 1 term on the on the other side. So, this is possible because all the sets involved have finite outer measure so this is the equation of real numbers. So, we can take one term on the other side and so on in general that will not be possible if Y , one of the terms is equal to plus infinity. So, the condition that μ^* of Y is finite is being used here.

So, we get using the fact that E_1 and E_2 are measurable we get this equation. So, from here let us take this negative term on the other side. So, implies μ^* of Y intersection E_1 union E_2 plus μ^* of Y intersection E_1 complement intersection E_2 complement, is equal to μ^* of this term Y intersection E_1 and the second term plus μ^* of Y intersection E_1 complement and now using the fact that E_1 is measurable this is same as

μ^* of Y . So, we have shown that for every sub set Y with μ^* of Y finite its measure μ^* of Y can be written as μ^* of E_1 , Y intersection E_1 union E_2 plus μ^* of Y intersection E_1 compliment, intersection E_2 compliment, but note this set is nothing, but E_1 union E_2 compliment. So, this implies that E_1 union E_2 is measurable.

So that says E_1 union E_2 is measurable and now for the special case so if E_1, E_2 are disjoint; that means, E_1 intersection E_2 is empty set that is same also implies that E_1 is contained in E_2 compliment or E_2 is contained in E_1 compliment, either 1 is true so note this is true. So, in that case let us go back and look at the first equation that we had, we had because E_1 and E_2 are measurable. So, we had this condition right. So, in this equation this is true for every Y .

So, let us replace this Y by E_1 union E_2 they will give us the measure μ^* of E_1 union E_2 . So, in this we are going to replace Y by E_1 union E_2 . So, let us just put that equation here and look at what we are doing. So, in this equation we are putting Y equal to so in this star.

(Refer Slide Time: 10:22)

The image shows a whiteboard with handwritten mathematical text. At the top right, there is a circled number '4'. Below it, the text reads: 'In ② put $Y = E_1 \cup E_2$ ($E_2 \subseteq E_1^c$)' with a circled '3' to the right. The next line is the equation:
$$\mu^*(E_1 \cup E_2) = \mu^*(E_1) + \mu^*(E_2)$$
 Below the equation, it says 'Thus μ^* is finitely additive'. In the bottom left corner, there is a small logo for NPTEL.

So, in star put Y equal to E_1 union E_2 keep in mind they are disjoint. So, the left hand side will be μ^* of E_1 union E_2 equal to right hand side the first term is μ^* of E_1 plus in the second term because E_1, E_2 are disjoint E_2 is a sub set of E_1 compliment. So, this implies E_2 is a sub set of E_1 compliment so; that means, this is nothing, but plus μ^* of E_2 , μ^* of E_2 . So, when E_1 and E_2 are disjoint μ^* of E_1 union E_2 is μ^*

star of E1 plus mu star of E2. So, that is; that means, though thus mu star is finitely additive. So, we have proved that whenever our so we have proved this property namely S star is an algebra of sub sets of X and mu star restricted to S star is finitely additive.

Next step is to go a bit further and we want to prove that whenever we got a sequence of sets in S star which are pair wise disjoint then their union is also in S star and mu star of the union is equal to summation of mu stars of An; that means, we are going to show that S star is close under pair wise disjoint union of sets, even countably infinite and mu star is countably additive. So, let us prove this property so let us take.

(Refer Slide Time: 12:27)

$$A_n \in \mathcal{S}^*, n=1,2,\dots$$

$$\text{pairwise disjoint, } A_n \cap A_m = \emptyset \text{ for } n \neq m.$$

$$A_1 \in \mathcal{S}^*, \forall Y \subseteq X$$

$$\Rightarrow \mu^*(Y) = \mu^*(Y \cap A_1) + \mu^*(Y \cap A_1^c)$$

$$= \mu^*(Y \cap A_1) + \mu^*(Y \cap A_1^c \cap A_2)$$

$$+ \mu^*(Y \cap A_1^c \cap A_2^c)$$

$$= \mu^*(Y \cap A_1) + \mu^*(Y \cap A_2) + \mu^*(Y \cap A_1^c \cap A_2^c)$$

$$\dots$$

$$= \sum_{i=1}^n \mu^*(Y \cap A_i) + \mu^*(Y \cap A_1^c \cap \dots \cap A_n^c)$$

So, An belong to S star n equal to 1 2 and so on, pair wise disjoint that is An intersection Am is empty for n not equal to m right. So, we start A1 belonging to S star, A1 measurable implies that mu star of any set Y can be for every Y contained in X, I can write this to be equal to mu star of Y intersection A1 plus mu star of Y intersection A1 compliment and now use the fact that A2 is measurable. So, leave the first term as it is, Y intersection A1 plus A2 is measurable.

So, measure of mu star of this set can be written as mu star of A1 compliment, intersection A2 plus mu star of Y intersection A1 compliment, intersection A2 compliment. So, this term mu star of Y intersection A1 compliment is written as mu star of Y intersection A1 compliment plus intersection A2 plus mu star of Y intersection A1 compliment, intersection A2 compliment. So, here we have used the fact that A2 is

measurable and now observe that A_1 and A_2 are disjoint. So, A_2 will be a sub set of A_1 complement so this set is nothing, but Y intersection A_2 . So, I get this is same as μ^* of first term A_1 the second term is μ^* of Y intersection A_2 and the third term as it is μ^* of Y intersection A_1 complement, intersection A_2 complement.

So, in the first we use A_1 is measurable in the second we use A_2 is measurable and use A_1 and A_2 are disjoint, we continue this process. If we continue this process after n steps we will have this is equal to the second step gives you μ^* of Y intersection A_1 plus μ^* of Y intersection A_2 . So, after n steps this will have μ^* of Y intersection A_i , i equal to 1 to n plus one term will be there which is μ^* of Y intersection A_1 complement intersection up to A_n complement right. So, let us write this last term in terms of union.

(Refer Slide Time: 15:29)

$$\begin{aligned} \mu^*(Y) &= \sum_{i=1}^n \mu^*(Y \cap A_i) + \mu^*(Y \cap (\bigcup_{i=1}^n A_i)^c) \quad (S) \\ &\geq \sum_{i=1}^n \mu^*(Y \cap A_i) + \mu^*(Y \cap (\bigcup_{i=1}^{\infty} A_i)^c) \\ \Rightarrow &\geq \sum_{i=1}^{\infty} \mu^*(Y \cap A_i) + \mu^*(Y \cap (\bigcup_{i=1}^{\infty} A_i)^c) \\ &\geq \mu^*(Y \cap (\bigcup_{i=1}^{\infty} A_i)) + \mu^*(Y \cap (\bigcup_{i=1}^{\infty} A_i)^c) \\ \Rightarrow &\bigcup_{i=1}^{\infty} A_i \in S^* \end{aligned}$$

So, this is equal to summation of i equal to 1 to n μ^* of Y intersection A_i plus μ^* of Y intersection union A_i , i equal to 1 to n compliments right. So, this term is represented in terms of compliments of the union. So, this is after n steps so far every n we have got μ^* of Y can be written as this and now this is true for every n . So, here I would like to write this union as 1 to infinity, if I do that I will be making this set bigger and hence the compliments will be a smaller set.

So, replacing this set so if I replace this by Y intersection union i equal to 1 to infinity of A_i complement this set is bigger than this, is smaller than this set. So, μ^* of this will

be bigger than μ^* of this. So, if I write μ^* of this. So, this term is bigger than this term. So, this will be bigger than or equal to summation i equal to 1 to n this term as it is $Y \cap A_i$ plus this. So, what we had done in the second term where it has union 1 to n , I have taken union 1 to infinity and because of compliments this term will be smaller. So, instead of equality I have got the inequality and this happens for every n .

So, I can let n go to infinity so this will be bigger than or equal to summation i equal to 1 to infinity μ^* of $Y \cap A_i$ plus μ^* of $Y \cap (\cup_{i=1}^{\infty} A_i)^c$ and now μ^* is countably sub additive. So, this term the first term is bigger than or equal to μ^* of $Y \cap (\cup_{i=1}^{\infty} A_i)$, i equal to 1 to infinity second term as it is. So, μ^* of $Y \cap (\cup_{i=1}^{\infty} A_i)^c$.

So, using the fact that for every n , A_n is a measurable set we are able to say that μ^* of Y is bigger than or equal to μ^* of $Y \cap (\cup_{i=1}^{\infty} A_i)$ plus μ^* of $Y \cap (\cup_{i=1}^{\infty} A_i)^c$. So, that implies that $\cup_{i=1}^{\infty} A_i$ belongs to \mathcal{S}^* is a measurable set not only that we can say something more actually. So, let us in this equation so this equation star this one, let us put Y is equal to $\cup_{i=1}^{\infty} A_i$ let us put Y equal to union of A_i 's. So, what will get. So, let us do that substitution and see what do we get.

(Refer Slide Time: 18:54)

Handwritten mathematical derivation on a whiteboard:

$$\rightarrow \geq \sum_{i=1}^{\infty} \mu^*(Y \cap A_i) + \mu^*(Y \cap (\cup_{i=1}^{\infty} A_i)^c)$$

in $\textcircled{3}$ put $Y = \cup_{i=1}^{\infty} A_i$.

$$\mu^*(\cup_{i=1}^{\infty} A_i) \geq \sum_{i=1}^{\infty} \mu^*(A_i) + 0$$

Also $\mu^*(\cup_{i=1}^{\infty} A_i) \leq \sum_{i=1}^{\infty} \mu^*(A_i)$

$\Rightarrow \mu^*$ is countably additive on \mathcal{S}^* .

So, in this equation in star take Y equal to union of A_i is then left hand side is μ^* of union A_i 1 to infinity is bigger than or equal to summation i equal to 1 to infinity μ^*

of Y is unions of A is. So, this is just A_i plus this is union and this is compliment that is empty set μ^* of that is equal to 0 so that is equal to 0. So, what we get is μ^* of the union of A is is bigger than or equal to this, also by sub additivity μ^* of the union A_i 's is less than or equal to summation 1 to infinity μ^* of A_i 's.

So, should, sorry imply that μ^* is countably additive on \mathcal{S}^* , so this is very nice. So, we have got the following property that if. So, what we have done till now is we have shown that \mathcal{S}^* as a consequence of all this properties now we can say that \mathcal{S}^* the class of all measurable sets is a sigma algebra of sub sets of S , as of X and μ^* on this is countably additive.

So, we started with a measure μ on a algebra \mathcal{A} of sub sets of A set X , we defined an outer measure via this on all sub sets of sub set X then we picked up \mathcal{A} sub class namely \mathcal{S}^* of sets which are μ^* measurable and we have shown that μ^* which in general is countably sub additive is actually countably additive, on \mathcal{S}^* the sigma algebra of measurable sets its. So, it is a sigma algebra, why it is a sigma algebra? Because we have already shown it is an algebra and it is closed under countable disjoint unions. So, any collection any algebra which is close under countable disjoint unions is automatically a sigma algebra that we have shown.

(Refer Slide Time: 21:32)

Properties of measurable sets

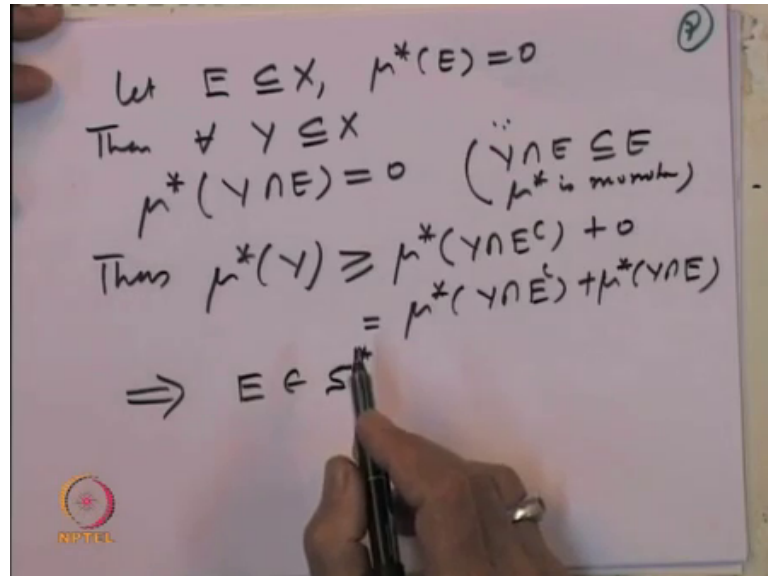

- Let $\mathcal{N} := \{E \subseteq X \mid \mu^*(E) = 0\}$.
Then $\mathcal{N} \subseteq \mathcal{S}^*$.
- Let $\mu : \mathcal{A} \rightarrow [0, \infty]$
be a measure.
If μ is σ -finite, then there exists a unique extension of μ to a measure $\bar{\mu} : \mathcal{S}(\mathcal{A}) \rightarrow [0, \infty]$.

NPTEL

So, this gives us say way of defining measures on ascending measures, let before doing that let us observe one more thing let us look at sets E in X whose outer measure is 0

these are called sets of outer null outer measure measurable sets. So, the claim is every set whose outer measure is 0 is automatically measurable. So, let us check that.

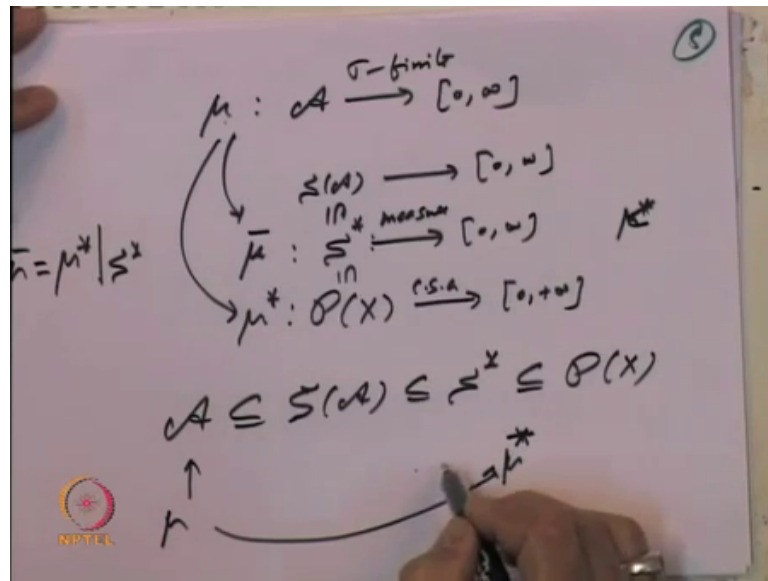

(Refer Slide Time: 22:00).

So, let E be a sub set of X and $\mu^*(E) = 0$ then for every Y contained in X $\mu^*(Y \cap E)$ is equal to 0 because $Y \cap E$ is contained in E and μ^* is monotone. So, this is 0 so thus $\mu^*(Y)$ is given in bigger than or equal to $\mu^*(Y \cap E^c)$ because again $Y \cap E^c$ is a sub set of X and I can add 0 to it. So, that is equal to $\mu^*(Y \cap E^c) + \mu^*(Y \cap E)$ and that is precisely saying that the set E is measurable.

So, that shows that the class of μ^* null sets are also measurable. So, this class is inside \mathcal{S}^* . So, let us summarize the process now what we have gotten. So, let us start with the measure μ on an algebra \mathcal{A} where μ is a measure, \mathcal{A} is an algebra of sub sets of the set X then if μ is sigma finite then there exists a unique extension of μ to the sigma algebra generated by it and how do we conclude that. So, that the conclusion for that is as follows.

(Refer Slide Time: 23:55)

So, μ is on the algebra and it is sigma finite given. So, we define from it outer measure μ^* which is defined on all sub sets of X it is countably sub additive and we picked up the class of measurable sets $\mathcal{S}(\mathcal{A})$. So, if we restrict μ to this so let us call it as $\bar{\mu}$ that is a restriction of μ to the smallest, smaller class $\mathcal{S}(\mathcal{A})$ keep in mind $\mathcal{S}(\mathcal{A})$ is right the class on measurable sets and so what is μ^* ?

μ^* , $\bar{\mu}$ so $\bar{\mu}$ is equal to μ^* restricted to $\mathcal{S}(\mathcal{A})$ then this is A measure $\bar{\mu}$ on $\mathcal{S}(\mathcal{A})$ is A sigma algebra and this is A measure and we know that this is an extension. So, from μ we come to $\bar{\mu}$ and extension of μ from the algebra to $\mathcal{S}(\mathcal{A})$ and note A is all sets in A are measurable. So, the sigma algebra is also inside here. So, A is inside $\mathcal{S}(\mathcal{A})$ of A which is inside $\mathcal{S}(\mathcal{A})$ which is inside all sub sets of X .

So, μ is defined here we get μ^* here and we restrict we get $\bar{\mu}$ and that is same as $\bar{\mu}$ on $\mathcal{S}(\mathcal{A})$. So, we get a measure $\bar{\mu}$ on $\mathcal{S}(\mathcal{A})$. So, that is same as $\bar{\mu}$ on $\mathcal{S}(\mathcal{A})$. So, what is $\bar{\mu}$? $\bar{\mu}$ is a restriction of the outer measure μ^* to the sigma algebra is related by A and that is inside the class of measurable sets. So, it is A well defined measure and because μ is sigma finite supposing there were another extension by some other method to the sigma algebra then by the uniqueness some measures on the sigma algebras we know that there is only 1 possible extension that we have already proved that, in case an extension exist if 2 measures agree on the algebra they will also agree on the sigma algebra provided their sigma finite. So, uniqueness

follows from that theorem. So, we have got that if μ is a sigma finite measure on an algebra then we can extend it to the sigma algebra generated by it so this is the extension process. So, we have to start with a measure μ on an algebra and recall we already have extended from a semi algebra to the algebra generated right.

So, essentially it says that if we have a measure on the sigma algebra of sub sets of set X and the measure μ is sigma finite then it can be uniquely extended to a sigma finite measure on the sigma algebra generated by that algebra. In fact, we have proved something more.

(Refer Slide Time: 27:20)

Properties of measurable sets

In fact, we have extended

$$\mu : \mathcal{A} \rightarrow [0, \infty]$$

to a measure on \mathcal{S}^* which includes $\mathcal{S}(\mathcal{A})$ and also \mathcal{N} , the class of all sets $E \subseteq X$ with $\mu^*(E) = 0$.

- One can show that

$$\mathcal{S}^* = \mathcal{S}(\mathcal{A}) \cup \mathcal{N}$$

$$:= \{E \cup N \mid E \in \mathcal{S}(\mathcal{A}), N \in \mathcal{N}\}.$$

 NPTEL

So, we have actually shown that not only μ which is defined on algebra extends to \mathcal{S} of \mathcal{A} , the sigma algebra generated by it actually it extends to a class \mathcal{S}^* which not only includes \mathcal{S} of \mathcal{A} it includes also the class of null sets μ^* null sets, sets of outer measure $\mu^* = 0$. So, let us denote the class of the sigma algebra generated by \mathcal{S} the sigma algebra generated by \mathcal{S} of \mathcal{A} and the null sets by a new name. So, what we are saying is we can show that this \mathcal{S}^* the class of all outer measurable sets which is a sigma algebra which includes \mathcal{S} of \mathcal{A} also if includes \mathcal{N} . So, it includes this union. So, we are writing it as, sets of the type $E \cup N$ it is not the union of these 2 classes it denotes sets of the type $E \cup N$ where E belongs to \mathcal{S} of \mathcal{A} and N is a null set. So, take sets which are in the sigma algebra generated by \mathcal{A} adjoin to it any null set μ^* null set. So, look at this new collection then one can show that \mathcal{S}^* is same as $E \cup N$.

So, it involves 2 things name one, namely this collection is a sigma algebra and this sigma algebra is same as S^* , we will not go in to the details of this they are slightly technical we will assume this.
