**Properties of Nonnegative Simple Measurable Functions**

(Refer Slide Time: 00:17)

The slide is titled "Properties" and contains the following text:

- For every  $E \in \mathcal{S}$  we have  $\chi_E f \in \mathbb{L}^+$ . If
$$\nu(E) := \int \chi_E f d\mu, E \in \mathcal{S},$$
then  $\nu$  is a measure on  $\mathcal{S}$  and  $\nu(E) = 0$  whenever  $\mu(E) = 0$ .
- The integral  $\int \chi_E f d\mu$  is also denoted by
$$\int_E f d\mu$$
 and is called the **integral of  $f$  over  $E$** .

The slide also features the NPTEL logo in the bottom left corner and a small copyright notice in the bottom right corner.

Next we prove an important property, and an extension of the earlier version for non negative simple functions; namely for every a measurable set  $E$ . If you look at the function, the indicator function of  $E$  times  $f$ , then that is also a nonnegative measurable function, and if its integral is denoted as  $\nu$  of  $e$ . So,  $\nu$  of  $E$  is the integral  $\chi_E f d\mu$ , where  $E$  belongs to  $\mathcal{S}$ , then this is a measure, this  $\nu$  is a measure on the sigma algebra  $\mathcal{S}$ , and has the property that  $\nu$  of a set  $E$  is 0, whenever  $\mu$  of the set  $E$  is equal to 0.

So, let us prove this property also, and this property again we are going to use the fact that the integral of a nonnegative simple measurable of a measurable function is given by, as a limit of the integrals of a increasing sequence of nonnegative simple measurable functions.

(Refer Slide Time: 01:21)

$$f \in L^+ \Rightarrow \exists s_n \in L^+_0$$
$$s_n \uparrow f \text{ and } \int f d\mu = \lim_{n \rightarrow \infty} \int s_n d\mu$$
$$\text{Now } E \in \mathcal{S}, \underbrace{\chi_E s_n} \uparrow \underbrace{\chi_E f}$$
$$\Rightarrow \chi_E f \in L^+ \text{ and } \int \chi_E f d\mu = \lim_{n \rightarrow \infty} \int \chi_E s_n d\mu$$

claim  $\nu(E) = \int_E f d\mu.$   
 $\nu$  is a measure.

So,  $f$  belonging to  $L^+$  implies, we have a sequence  $s_n$  belonging to  $L^+_0$ ; such that  $s_n$  increases to  $f$ , and  $\int f d\mu$  is written as  $\lim_{n \rightarrow \infty} \int s_n d\mu$ . So, that is by the fact that  $f$  belongs to  $L^+$ , and integral of  $f$  is defined as limit of integral  $s_n d\mu$  for any sequences  $n$  which increases to  $f$ .

Now, for  $E$  a set in the sigma algebra  $\mathcal{S}$ , because  $s_n$  is increasing to  $f$ . So, clearly indicator function of  $E$  times  $s_n$  will increase to indicator function of  $E$  times  $f$ , and observe we have done it earlier also, that this is a nonnegative simple measurable function, it is increasing to this function. So, that implies that indicator function of  $E$  times  $f$ . So, this implies that the indicator function of  $E$  times  $f$  is a nonnegative measurable function, and because we have got this sequence increasing to this nonnegative measurable function. So, integral of the indicator function of  $E$  times  $f d\mu$  is nothing, but  $\lim_{n \rightarrow \infty} \int \chi_E s_n d\mu$ . So, that is, this is how the integral is defined. And now we want to claim that if you call this number  $\nu$  of  $E$  as  $\int_E f d\mu$ , then  $\nu$  is a, the claim is  $\nu$  is a measure.

(Refer Slide Time: 03:31)

$$\begin{aligned}
 \text{Then } v(E) &= \sum_{i=1}^{\infty} v(E_i) ? \\
 v(E) &:= \int \chi_E f d\mu \\
 &= \lim_{n \rightarrow \infty} \left( \int \chi_E s_n d\mu \right) \\
 &= \lim_{n \rightarrow \infty} \left( \int \sum_{i=1}^{\infty} \chi_{E_i} s_n d\mu \right) \\
 &= \sum_{i=1}^{\infty} \left( \lim_{n \rightarrow \infty} \int \chi_{E_i} s_n d\mu \right)
 \end{aligned}$$

So, to prove this let us. So, what we have to prove is the following. So, to prove this is what you have to show that, if a set  $E$  is a countable disjoint union of sets  $E_i$   $E_i$ 's in the sigma algebra  $S$ , then we want to show that  $\nu$  of  $E$  is equal to  $\sum_{i=1}^{\infty} \nu$  of  $E_i$   $i$  equal to 1 to infinity. So, this is what we have to show. So, let us start looking at  $\nu$  of  $E$  by definition  $\nu$  of  $E$ . Just now we saw that  $\nu$  of  $E$  is nothing, but integral of the indicator function of  $E$  times  $f$   $d\mu$  right. So, integral of  $E$   $f$   $d\mu$  is nothing, but limit of integral indicator function of  $E$   $s_n$   $d\mu$ , by the fact that  $s_n$  is increasing to  $f$ . So, just now observed that.

So, this can be written as limit  $n$  going to infinity of integral indicator function of  $E$   $s_n$   $d\mu$ . So, is just from the fact that  $s_n$  is increasing to  $f$ . So, indicator function of  $E$  times  $s_n$  will increase to indicate the function  $E$  times  $f$ . hence integral of indicator function of  $E$  times  $f$  is nothing, but the limit of the integrals of the indicator function  $E$   $s_n$   $d\mu$ , and now this  $E$  is a disjoint union of sets  $E_i$ . So, that implies. So, let us write this limit  $n$  going to infinity of. So, this  $i$  can write as summation  $\chi_{E_i}$  of  $s_n$   $d\mu$   $i$  equal to 1 to infinity. So, here we are using the fact that  $E$  is a disjoint union of sets  $E_i$  and for a nonnegative measurable function  $s_n$ , if you integrated over a set  $E$ , then that is a measure.

So, that is the property. So, the corresponding property for non negative simple measurable functions which we had already proved is true. So, we are using that fact to

bring it here, and now this is limit of a series  $i$  equal to 1 to infinity of. Sorry this is a integral here, integral of  $\chi_{E_i}$ . So,  $E$  is union. So, this is integral of the union. So, now, I am going to interchange this summation, and all limit and summation  $Y$  equal to 1 to infinity, and that is allowed, because all the quantity is involved are non negative.

So, this interchange is possible. So, I can write it as summation  $i$  equal to 1 to infinity, limit  $n$  going to infinity of integral  $\chi_{E_i} S_n d\mu$ . And now we simply observe that this last quantity is nothing, but summation  $i$  equal to 1 to infinity, limit  $n$  going to infinity, and the last quantity is nothing, but a  $\lim_{n \rightarrow \infty} S_n$ . So, that is that limit is nothing, but integral of  $\chi_{E_i} f d\mu$ , because  $S_n$  is increasing to  $f$ . So,  $\chi_{E_i}$  times  $S_n$  increases to  $\chi_{E_i}$  times  $f$ . So, this, this limit. So, this limit of  $n$  going to infinity integral of  $\chi_{E_i} S_n d\mu$  is nothing, but integral of  $\chi_{E_i}$  times  $f$ . So, that value you put. So, and that is nothing.

(Refer Slide Time: 07:43)

$$\begin{aligned}
 &= \sum_{i=1}^{\infty} \lim_{n \rightarrow \infty} \int \chi_{E_i} f d\mu \\
 &= \sum_{i=1}^{\infty} \nu(E_i)
 \end{aligned}$$

---

Suppose  $\mu(E) = 0$

$$\begin{aligned}
 \nu(E) &= \int \chi_E f d\mu \\
 &= \lim_{n \rightarrow \infty} \int \chi_E S_n d\mu \\
 &= 0
 \end{aligned}$$

But our definition of  $\nu$  of  $E_i$  so that proves that  $\nu$  is a measure on  $E_i$ . And once again observe that here we have used basically what we have done is. We have used the fact  $f$  is a limit of increasing sequence of nonnegative simple measurable functions.

So, integrals of nonnegative simple measurable functions that sequence gives you integral of  $f$  and then; so, go to that sequence, use the property for non negative simple measurable functions, that property is true. So, and come back, and finally, to prove that  $\nu$  of  $E$  equal to 0 implies  $\mu$  of  $E$  equal to 0. So, that is. So, suppose  $\mu$  of  $E$  equal to 0,

then what is  $\nu$  of  $E$ ; so,  $\nu$  of  $E$  which was defined as  $\int \chi_E f d\mu$  which was nothing, but  $\int \chi_E d\mu$  limit of that. So, let us write limit  $n$  going to infinity of this, but this  $\mu$  of  $E$  being 0, this. So, integral is 0. So, this is equal to 0.

So, once again for a nonnegative simple measurable function, its integral over  $E$  is 0, if  $\mu$  of  $E$  is 0. So, that property is being used once again here. So, this proves the fact that, this measure  $\nu$  of  $E$  which is constructed as  $\int \chi_E f d\mu$  is a special measure, which has the property, that it is null sets  $\nu$  of  $E$  is 0, whenever  $\mu$  of  $E$  is 0.

So, till now what we have done is. We had define the integral of a nonnegative simple measurable function as a limit of integral of a nonnegative simple measurable functions, because if  $f$  is nonnegative measurable, it is a limit of nonnegative simple measurable functions, which increase to this function  $f$ . So, integrals of those non negative simple measurable functions is defined, take their limit and define integral of  $f$  to be limit of the integrals of nonnegative simple measurable functions, and using this, we have proved that this integration is linear.

So, the next property we want to analyze is, this is this class. How does this class of non negative measurable functions and the operation of integral behave for sequences in the class helpless. So, here is the first important theorem that we are going to prove and that is ok.

(Refer Slide Time: 10:44)

Properties

- For  $f_1, f_2 \in \mathbb{L}^+$ , if  $f_1(x) = f_2(x)$  for a.e.  $x(\mu)$ , then

$$\int f_1 d\mu = \int f_2 d\mu.$$

NPTEL

Before that let us just prove just a simple observation that if  $f_1$  and  $f_2$  are non negative simple, and  $f_1$  is equal to  $f_2$  almost everywhere, then integral of  $f_1$  is equal to integral of  $f_2$ . So, that property is quite obvious.

(Refer Slide Time: 11:05)

$$\begin{aligned}
 N &= \{x \in X \mid f_1(x) \neq f_2(x)\} \\
 X &= N \cup N^c \\
 \text{Given } \int_N f_1 d\mu &= 0 \quad \mu(N) = 0 \\
 \int f_1 d\mu &= \int_N f_1 d\mu + \int_{N^c} f_1 d\mu \\
 &= 0 + \int_{N^c} f_1 d\mu \\
 &= \int_{N^c} f_2 d\mu + \int_{N^c} f_2 d\mu \\
 &= \int_{N^c} f_2 d\mu \\
 &= \int f_2 d\mu
 \end{aligned}$$

Because let us write the set  $n$  to be the set all  $X$  belonging to  $X$ , where  $f_1$  is not equal to  $f_2$  of  $X$ , then the whole space can be written as  $n$  union  $n$  complement and we are given. So, we are given  $f_1$  is equal to  $f_2$ . So,  $f_1$  of  $n$  complement, we are given  $f_1$  is equal to  $f_2$  almost everywhere.

So, where they are not equal; so, this set has got  $f_1$ . Sorry we are given that, sorry we are given that this set  $n$   $f_1$  is equal to  $f_2$  almost everywhere. So, where they are not equal, that is a set of measure 0. So,  $\mu$  of  $n$  is equal to 0. So, now, integral of  $f_1$   $d\mu$  can be written as integral over  $n$   $f_1$   $d\mu$  plus integral over  $n$  complement of  $f_1$   $d\mu$ , this is by the fact. Just now we have proved that integral over a set is a measure. So, this is integral over  $n$ , and integral over  $n$  complement that gives me integral over the whole space, and  $\mu$  of  $n$  being equal to 0. So, this is, this first term is 0 plus integral over  $n$  complement  $f_1$   $d\mu$ , but this is also same as integral over  $n$  of  $f_2$   $d\mu$ , because measure of  $n$  is 0 and on  $n$  complement  $f_1$  is equal to  $f_2$ .

So, I can write as  $n$  complement  $f_2$   $d\mu$ , and that once again is equal to integral  $f_2$   $d\mu$ . So, integral  $f_1$   $d\mu$  is equal to integral of  $f_2$   $d\mu$ . So, that essentially says that the integral of a function does not change, if its change, its values on a set of measure 0.

(Refer Slide Time: 13:04)

Monotone convergence Theorem

Let  $\{f_n\}_{n \geq 1}$  be a sequence of functions in  $\mathbb{L}^+$ , increasing to  $f(x)$ , i.e.,

$$f(x) := \lim_{n \rightarrow \infty} f_n(x), x \in X.$$

Then  $f \in \mathbb{L}^+$  and

$$\int f d\mu = \lim_{n \rightarrow \infty} \int f_n d\mu.$$

NPTEL

© Under a Name, 47 Number - p. 1313

So, let us now come back to the property that I was trying to state earlier; namely if we have a sequence  $f_n$  of nonnegative simple measurable functions, and  $f_n$ 's increased to  $f$ ; that is  $f(x) = \lim_{n \rightarrow \infty} f_n(x)$ , then the claim is  $f$  belongs to  $\mathbb{L}^+$  and  $\int f d\mu = \lim_{n \rightarrow \infty} \int f_n d\mu$ . So, this is one of the important theorems in our subject, it is called monotone convergence theorem.

Monotone, because we are looking at sequence  $f_n$  which is a increasing sequence is a sequence of functions, which is increasing. So, it is a monotonically increasing sequence, increasing sequence of a nonnegative measurable functions, increasing to a function  $f$ . We have already seen that  $f$  will be a measurable function, it is nonnegative, but the important thing is integral of  $f$ . So,  $\int f d\mu = \lim_{n \rightarrow \infty} \int f_n d\mu$ . So, that is the important property we want to prove for integral for non negative symbol, non negative measurable function.

The proof of this requires a, some construction, and we do not have time today to complete the proof. So, we will do the proof of this theorem next time. So, we stop here today, by having stated the monotone convergence theorem, and look at the proof of this in the next lecture.

Thank you.
