**Lecture – 26 A**  
**Computation of Product Measure – II**

In the previous lecture we had started looking at how to compute product measure of a set in the product sigma algebra. We had shown part of theorem and we will continue looking at the proof of that theorem in this lecture. So, let us just recall what we have been doing.

So, we were looking at computing the product measure, so we will continue that study today.

(Refer Slide Time: 00:45)

**Product of measures-recall**

For  $E \subseteq X \times Y$ ,  $x \in X$  and  $y \in Y$ , we defined the sections

$$E_x := \{y \in Y \mid (x, y) \in E\}$$

and

$$E^y := \{x \in X \mid (x, y) \in E\}.$$

■ (i) For  $E \in \mathcal{A} \otimes \mathcal{B}$ , and for every  $x \in X, y \in Y$

$$E_x \in \mathcal{B} \text{ and } E^y \in \mathcal{A}.$$

 NPTEL

So, let us just recall the settings we have a sub set  $E$  contained in the product set  $Z$  cross  $Y$ , and for any element  $x$  in  $X$  and  $y$  in  $Y$ . We defined what is called the  $x$  section  $E_x$  and  $E_y$  in the previous lectures. And then we claimed that for every set  $E$  in the product sigma algebra set sections  $E_x$  is a element of the sigma algebra  $\mathcal{B}$ , and the section at  $y$  is an element in the sigma algebra  $\mathcal{A}$ . So, this we had proved. So, I am just recalling them.

(Refer Slide Time: 01:26)

Product of measures-recall

- (ii) The functions  
 $x \mapsto \nu(E_x)$   
and  
 $y \mapsto \mu(E^y)$   
are measurable functions on  $X$  and  $Y$ ,  
respectively,
- (iii) and

$$\int_X \nu(E_x) d\mu(x) = (\mu \times \nu)(E) = \int_Y \mu(E^y) d\nu(y)$$

And then we proved that the functions  $x$  going to  $\nu$  measure of  $E_x$  is a subset of  $B$ , and  $\nu$  is measure define there. So, we can compute what is a  $\nu$  of  $E_x$ , and the claim is that the function for every  $x$  the image being  $\nu$  of  $E_x$  this is a function defined on  $x$  and the claim it is a measurable. And similarly function  $y$  going to the measure of the  $y$  section is a measurable function on the set  $y$  with respect to the sigma algebra  $B$ .

So, this 2 we have proved and we wanted to prove finally, the third one that if we integrate these functions with respect to  $\mu$ , and with respect to  $\nu$  these are non negative measurable functions and we can integrate them. So, the claim is that the integral  $\nu E_x d\mu x$  is same as the product measure  $\mu$  cross  $\nu$  of  $E$  and it is same as the integral of the  $y$  section with respect to  $y$ . So, this is the step we were trying to proved in the previous lecture.

So, to prove this what we said let us look at the class of those sub sets  $E$  in the product sigma algebra for which this is true.

(Refer Slide Time: 02:51)

**Product of measures-recall**

- Let  $\mathcal{P} := \{E \in \mathcal{A} \otimes \mathcal{B} \mid \text{(ii) and (iii) hold}\}$ .

To show that  $\mathcal{P} = \mathcal{A} \otimes \mathcal{B}$ :

Step 1:  
 $\mathcal{P}$  includes  $\mathcal{R} = \{A \times B \mid A \in \mathcal{A}, B \in \mathcal{B}\}$  and  
 $\mathcal{P}$  closed under finite disjoint unions.  
implying  $\mathcal{F}_*(\mathcal{R}) \subseteq \mathcal{P}$ ,  $\mathcal{F}(\mathcal{R})$  is the algebra  
generated by  $\mathcal{R}$ .

(Refer Slide Time: 02:59)

**Product of measures-recall**

- (ii) The functions  
 $x \mapsto \nu(E_x)$   
and  
 $y \mapsto \mu(E^y)$   
are measurable functions on  $X$  and  $Y$ ,  
respectively,  
(iii) and

$$\int_X \nu(E_x) d\mu(x) = (\mu \times \nu)(E) = \int_Y \mu(E^y) d\nu(y)$$

So, we constructed the class  $\mathcal{P}$  all those subsets in the product sigma algebra such that the previous 2 claims namely this a claim 2, and claim 3 both hold namely  $x$  going to  $\nu(E_x)$  and  $y$  going to  $\mu(E^y)$  are measurable functions.

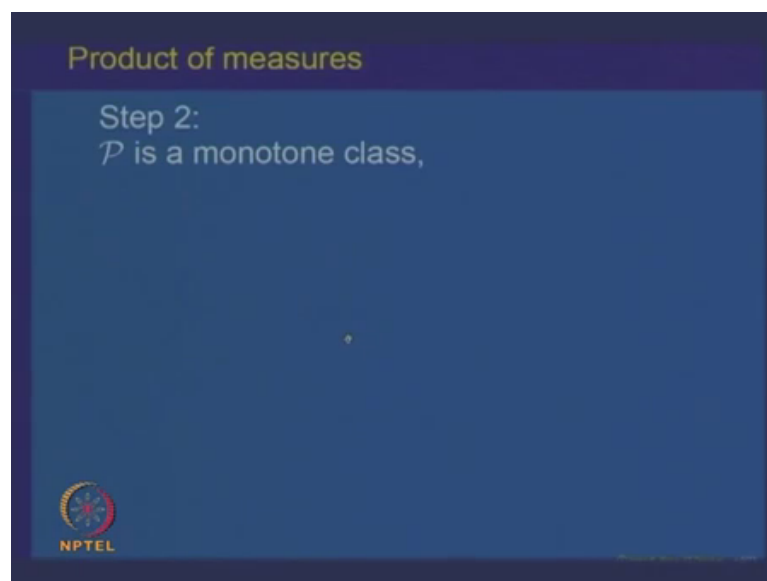

So,  $\mathcal{P}$  is the family of all subsets  $A$  cross  $B$  such that the property 2 and 3 hold. So, what just recall what are the properties 2 and 3? Property 2 is that  $x$  going to  $\nu(E_x)$  and  $y$  going to  $\mu(E^y)$  these are non negative measurable functions. And the property 3 says

that the integrals of  $\nu \chi_E$  with respect to  $\mu$  is same as the integral of  $\mu \chi_E$  with respect to  $\nu$ , and both are equal to product measure of  $E$ .

So, the both these properties holds for a set  $E$ , then that set is in the collection  $\mathcal{P}$ . So, our aim is to prove that  $\mathcal{P}$  is equal to the product sigma algebra  $\mathcal{A} \times \mathcal{B}$ . Already observed in the previous lecture to show this the first step is to prove that this class  $\mathcal{P}$  includes the rectangles so that is one. So, that we had proved and also we had proved that this class  $\mathcal{P}$  is closed under finite disjoint unions. So, once this class is  $\mathcal{P}$  is closed under finite disjoint unions and includes the rectangles rectangles form a semi algebra. So, the algebra generated by it looks like the class of sets which are finite disjoint union of rectangles.

And  $\mathcal{P}$  being closed under such operations will get that as a consequence of this that the algebra  $\mathcal{F} \times \mathcal{R}$  generated by this rectangles is also inside  $\mathcal{P}$ . So, as a consequence of step one we get the algebra generated by the rectangles in inside the class  $\mathcal{P}$ .

(Refer Slide Time: 04:50)

So, the second step we wanted to prove that this class  $\mathcal{P}$  is a monotone class. And the reason for that to prove that is a monotone class is a following this class  $\mathcal{P}$  it is directly it is difficult to show that it is a sigma algebra. Because if you could show directly that  $\mathcal{P}$  is a sigma algebra it includes algebra generated by rectangles. So, then it will include the sigma algebra generated by it that directly root is not possible.

So, we follow the monotone class result namely if we are able to show that  $\mathcal{P}$  is a monotone class and  $\mathcal{F} \times \mathcal{R}$  being inside it the monotone class generated by  $\mathcal{F} \times \mathcal{R}$  will be inside  $\mathcal{P}$ . And  $\mathcal{F} \times \mathcal{R}$  being algebra the monotone class generated by an algebra is same as the sigma algebra generated by that class. So, we will get that the sigma algebra generated by rectangles will be inside  $\mathcal{P}$ , and that is precisely what we want to show and that is  $\mathcal{A} \times \mathcal{B}$  because the sigma algebra generated by rectangles is the product sigma algebra  $\mathcal{A} \times \mathcal{B}$ .

So, to complete that proof we have to only show that the class  $\mathcal{P}$  is a monotone class. So, let us start proving that  $\mathcal{P}$  is a monotone class.

(Refer Slide Time: 06:04)

$$\mathcal{P} = \left\{ E \in \mathcal{A} \otimes \mathcal{B} \mid \begin{array}{l} x \mapsto \nu(E_x) \\ y \mapsto \mu(E_y) \end{array} \right\}^{\text{mbk}}$$
 and 
$$\int_X \nu(E_x) d\mu(x) = \int_Y \mu(E_y) d\nu(y) = (\mu \times \nu)(E)$$

(1) Let  $E_n \in \mathcal{P}, n \geq 1, E_n \uparrow$ . To show  $E = \bigcup_{n=1}^{\infty} E_n \in \mathcal{P}$ ?

$x \mapsto \nu(E_x)$  is  $\mathcal{A}$ -mbk fr.?

$E_n \in \mathcal{P} \Rightarrow x \mapsto \nu(E_{n,x})$  is mbk + n.

So,  $\mathcal{P}$  is the class of all the those subsets  $E$  belonging to the product sigma algebra  $\mathcal{A} \times \mathcal{B}$ , such that if we look at the set  $x$  going to take the  $E$  take it section  $x$  that is subset of the set  $y$  in the sigma algebra  $\mathcal{B}$ . So, nu of that make sense. So, we get this function. So, this is measurable and the function  $y$  going to  $\mu$  of  $E_y$  that is  $E$  is measurable.

So, both this functions are measurable. And the property that if you integrate nu of  $E_x$  with respect to  $\mu$ . So, we are integrating over  $x$ , this is same as the integral over  $y$  of the second function  $\mu$  of  $E_y$  with respect to  $d\nu E_y$ . And both of them are equal to the product sigma algebra  $\mu \times \nu$  of  $E$ . So, this the collection of all those sets  $E$  in the product sigma algebra this holds, and we want to show that  $\mathcal{P}$  is a monotone class.

So, let us look at the first property. So, let  $E_n$  belong to  $\mathcal{P}$   $E_n \in \mathcal{B}$  collection of sets in the class  $\mathcal{P}$  such that  $E_n$  is increasing. So, to show that the set  $E$  which is equal to union of  $E_n$ 's also belongs to  $\mathcal{P}$ . So, this is what we have to the first to show that  $\mathcal{P}$  is monotone class, we have to show it is closed under increasing unions and decreasing inter sections. So, that is the 2 properties we have to check.

The let us check a sequence  $E_n \in \mathcal{P}$  which is increasing a let us  $E$  is the union of this  $E_n$ 's. So, the claim is that  $E$  belongs to  $\mathcal{P}$ . So, what we have to do? We have to look at the corresponding, so what is the first property we have to check. So, to check that  $E$  belongs., we have to look at nu of  $E_x$ . So, the first thing we have to show is that this is measurable is a measurable function ok.

So, to do that let us observe in the following. So, this is what we have to show. Now  $E_n$  each  $E_n$  belongs to  $\mathcal{P}$ . So, implies that  $x$  going to nu of  $E_n$  it section at  $x$  is measurable for every  $n$ . So, this is what is given to us. And we want to come to nu of  $E$ .

(Refer Slide Time: 08:58)

$E_n \uparrow E, (E_n)_x \uparrow E_x \text{ in } \mathcal{B}$   
 $\Rightarrow \int (E_n)_x d\mu(x) \rightarrow \int E_x d\mu(x) \text{ --- } (\otimes)$   
 $\Rightarrow x \mapsto \int E_x d\mu(x) \text{ is mkt.}$   
Next  
 $\int E_x d\mu(x) = (\mu \times \nu)(E)?$   
 $(\otimes)$  and monotone convergence thm  
 $\Rightarrow \int E_x d\mu(x) = \lim_{n \rightarrow \infty} \int (E_n)_x d\mu(x)$

But for that So, let us observe that as  $E_n$  is increasing to  $E$  the sections  $E_n x$  is a increasing sequence of sets increasing to  $E$  of  $x$ . So, this is the sequence of sets in the sigma algebra  $\mathcal{B}$ .

So, that we have already seen that if  $a$  is a subset of  $B$  then the section of  $a$  is the subset of section of  $B$ . So, that will prove that is a  $E$  is the sections are increasing and the

increase to the union. So, union of the sections. So, union of  $E_n$  at  $x$  this is same as union of each  $E_n$  and hence this is increasing to  $x$ .

So, this is a simple observation using the properties of the sections. So,  $E_n(x)$  is increasing and now you recall that  $\nu$  being a measure if a sequence of sets increasing to another set. So, that implies that  $\nu$  of  $E_n \times X$  the sections that will increase that will converged to  $\nu$  of  $E \times X$ . So, that proves that  $\nu$  of  $E_n \times X$  increases now each one of them is a measurable function. So,  $\nu$  of  $E \times X$  is a limit of measurable functions.

So, that implies that  $x$  going to  $\nu$  of  $E \times X$  is measurable. So, basically what we have saying is the because the  $\nu$  of  $E \times X$ . So, the function  $x$  going to  $\nu$  of  $E \times X$  is a limit of the functions  $\nu$  of  $E_n \times X$ . And that comes from the fact that because  $E_n$  is increasing to  $E$ . So, the sections  $E_n \times X$  increase to the section  $E \times X$  and; that means, in the sigma algebra  $B$  and  $\nu$  being a measure  $\nu$  of  $E_n \times X$  converged to  $\nu$  of  $E \times X$ .

And each one of them being measurable because  $I$  it is in the collection  $P$ . So, each is a measurable function. So, limit of measurable function is measurable. So, that proves one part that  $x$  going to  $\nu$  of  $E \times X$  is measurable. So, next what we have to check is a following we have to check that  $\int \nu$  of  $E \times X$   $d\mu \times \nu$  over  $X$  is equal to  $\nu$  cross  $\nu$  of  $E$ .

So, this is what we want to check. So now, once again let us go back to the earlier fact that we saw that  $\nu$  of  $E_n \times X$  the sections these measurable functions. These are actually non negative measurable functions and their converging to the function  $\nu$  of  $E \times X$ . And that is a increasing sequence of measurable functions. So, this is  $\nu$  of  $E_n \times X$  is a increasing sequence of non negative measurable functions converging to a measurable function  $\nu$  of  $E \times X$ .

So, we can apply our monotone convergence theorem. So, that says so by, once again this property star and monotone convergence theorem, theorem apply, and apply and they give us as a consequence that  $\int \nu$  of  $E \times X$   $d\mu \times \nu$  over  $X$  because  $\nu$  of  $E \times X$  is a limit of increasing sequence of non negative measurable functions. So,  $\int \nu$  of  $E \times X$  must be equal to limit  $n$  going to infinity of the integrals of the corresponding sequence of non negative measurable functions and they are  $\nu$  of  $E_n \times X$   $d\mu \times \nu$ .

So, this is an application of the monotone convergence theorem. Let us observe that  $E_n$  belongs to the class  $\mathcal{P}$ . So, property 2 of that says that if I integrate  $\nu$  of  $E_n$  sections with respect to  $\mu$ .

(Refer Slide Time: 13:10)

$$= \lim_{n \rightarrow \infty} \int (\mu \times \nu)(E_n)$$

$$\int_X \nu(E_n) d\mu = (\mu \times \nu)(E_n)$$

$\Rightarrow E \in \mathcal{D}$

Next  $E_n \in \mathcal{D}, n \geq 1, E_n \downarrow E, \text{ i.e. } E = \bigcap_{n=1}^{\infty} E_n.$

Claim  $E \in \mathcal{D}?$

This integral is equal to the product measure  $\mu$  cross  $\nu$  of  $E_n$ . So, that is because  $E_n$  belongs to the class  $\mathcal{P}$ . So, by the third property of the collection of sets in  $\mathcal{P}$ ; that means,  $\nu$  of  $\mu$  cross  $\nu$  of the product measure of  $E_n$  is an integral of the sections with respect to  $x$ . So, we can say that this integral is equal to the limit  $n$  going to infinity of  $\mu$  cross  $\nu$  of  $E_n$ .

So, once that is true we want to look at this limit once again let us observe that  $E_n$  is an increasing sequence of sets in the sigma algebra  $\mathcal{A}$  cross  $\mathcal{B}$ , and  $\mu$  cross  $\nu$  is a measure. So, once again using the property of measure that if a sequence of sets is increasing then the measure of the limit of the sequence is equal to the measure of the limit. So, that is equal to  $\mu$  cross  $\nu$  of  $E$ .

So, once again we have used the set that  $E_n$  is increasing to  $E$  and  $\mu$  cross  $\nu$  is a measure, so this limit must be equal to  $\mu$  cross  $\nu$  of  $E$ . What we get is that this limit is equal to this. So that means, we get that  $\mu$  of integral over  $x$  of  $\nu$  of  $E$   $\times$   $d\mu$   $\times$  is equal to  $\mu$  cross  $\nu$  of  $E$ . So, we have proved that if  $E_n$  is increasing to  $E$ . So, this implies that  $E$  belongs to the class  $\mathcal{P}$ . Because we showed that if  $E_n$  is increasing to  $E$  then both the properties hold for this ok.

Now we want to do this a similar thing for decreasing. So, next let us consider  $E_n$  belonging to  $P$  and bigger than or equal to 1 and  $E_n$ 's decrease to  $E$ . That is  $E$  is equal to intersection  $E_n$ 's  $n$  equal to 1 to infinity. So, claim we want to claim that  $E$  belongs to  $P$ . So, this is what we want to check. So, we can try to copy the proof for the increasing case. So, let us back to the proof of the increasing case and let us see can be carry over the proof by sayings similarly. So now, we have got  $E_n$ 's decreasing. So, because  $E_n$ 's belong so what we said first thing was that because  $E_n$ 's belong to  $P$ . So, this is a measurable function.
