**Lecture No. – 08  
Primary Decomposition  
(Contd)**

Alright, so now in this lecture after discussion with the associated prime support etcetera, now we will come to what is called primary decomposition. This is a generalization of a prime decomposition that we will see it once we have defined it what it is precisely, so let us first define it what it is, definition, so always let  $A$  be a Noetherian ring, and  $V$   $A$ -module, and  $U$  sub-module of  $V$ , alright.

Now finite family, finite family  $Q_i, i \in I$  is a finite index set of sub-modules of  $V$  which are primary sub-modules in  $V$ , that means the homothesis are either injective or nilpotent and there this  $Q_i$  will be primary corresponding to some prime ideal,  
(Refer Slide Time: 02:35)

## Primary Decomposition

(1)

Def Let  $A$  be a noetherian ring and  $V$   $A$ -module,  $U \subseteq V$  submodule. A finite family  $Q_i, i \in I$  of submodules of  $V$  which are primary submodules in  $V$

so finite family of sub-modules is called, such that the given sub-module  $U$  is intersection of this  $Q_i$ 's, this is called, also this equality so this is called a primary decomposition of  $U$  in  $V$ .

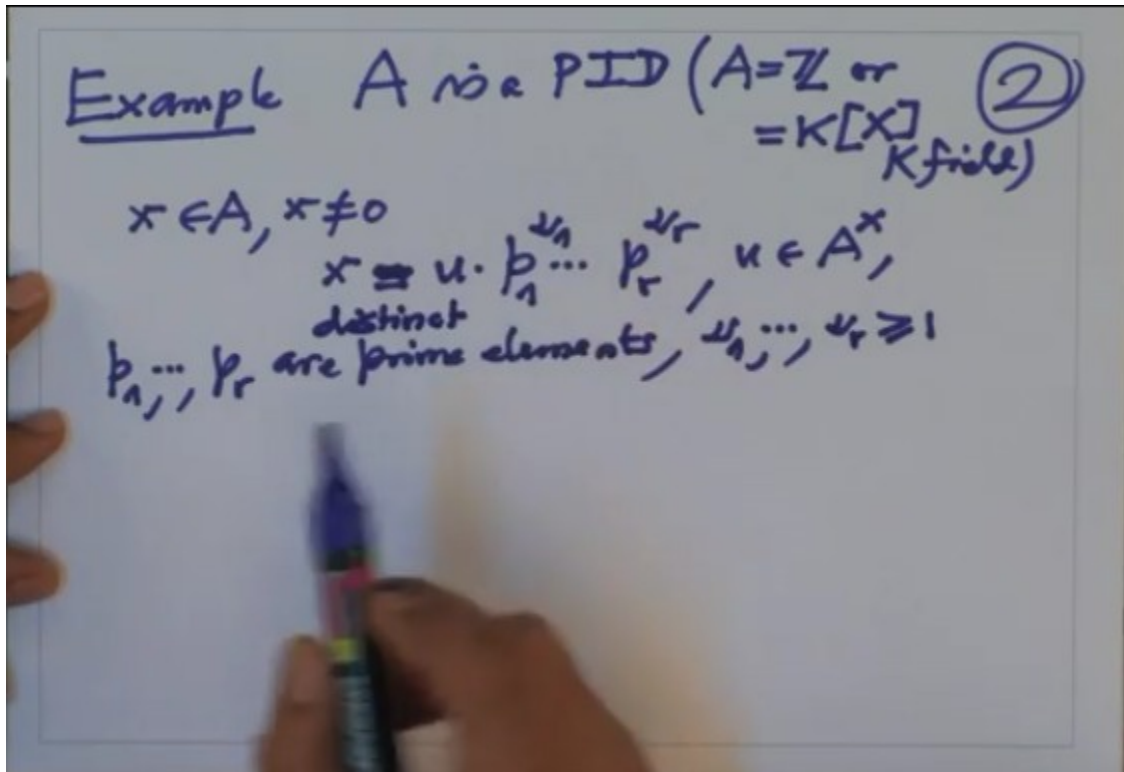

So now there are several questions will come up namely whether does it exists,  
(Refer Slide Time: 03:31)

## Primary Decomposition

①

Def Let  $A$  be a noetherian ring and  $V$   $A$ -module,  $U \subseteq V$  submodule. A finite family  $Q_i, i \in I$  of submodules of  $V$  which are primary submodules in  $V$  is called such that  $U = \bigcap_{i \in I} Q_i$ . This is called a primary decomposition of  $U$  in  $V$ .

is it unique and so on. So but before that as I said I just want to say that this is a generalization of the prime decomposition, so look at this example, example so suppose  $A$  is a PID, for example you can take either  $A$  equal to ring of integers or polynomial ring in one variable over a field  $K$ , then we know that if I take any nonzero element  $x \in A$ ,  $x$  nonzero, then we know that this  $x$  has a prime decomposition that means  $x$  is a unique, product of some unique times some  $p_1^{v_1} \dots p_r^{v_r}$  where  $U$  is a unit in the ring, and this  $p_1$  to  $p_r$  are prime elements, that means they generate, each one of them generate it's a prime ideal and this  $v_1$  to  $v_r$  are the multiplicities that is bigger equal to 1 and they are distinct prime ideals, because equal ones we have collected together, so such a thing is called a prime decomposition of a nonzero element in a PID, we know that in such,  
(Refer Slide Time: 05:07)

because PID's are UFD so every nonzero element has a factorization like that.

Now when I translate this in terms of the ideals that means ideal generated by  $x$  that is this is, this will go away because ideal generated that is  $A$  so this is  $(Ap_1)^{v_1} \cap \dots \cap (Ap_r)^{v_r}$ , this becomes intersection because a product and intersection is same then the ideals are co-maximal but because they are distinct primes, these ideals are co-maximal  $AP_i$  and  $AP_j$  for distinct  $i$  and  $j$ , this is the whole ring  $A$  for  $i \neq j$ , therefore this equality holds, and moreover because they are prime elements, this  $AP_i$ 's are prime ideals, not only their prime ideals they are actually the maximal ideals because they are nonzero prime ideals in a PID, nonzero prime ideal in a PID maximal therefore this, therefore they are maximal ideals, therefore their powers, therefore  $AP_i^{v_i}$  this are  $AP_i$  primary ideals, therefore what this equality is nothing but it's a primary decomposition of the ideal  $Ax$ ,  
 (Refer Slide Time: 06:43)

Example  $A$  is a PID ( $A = \mathbb{Z}$  or  $K[x]$  where  $K$  is a field) (2)

$x \in A, x \neq 0$   
 $x = u \cdot p_1^{\nu_1} \cdots p_r^{\nu_r}, u \in A^\times$   
 $p_1, \dots, p_r$  are distinct prime elements,  $\nu_1, \dots, \nu_r \geq 1$   
 $Ax = \bigcap_{i=1}^r (Ap_i)^{\nu_i}$   
 $(Ap_i + Ap_j = A, i \neq j) \iff Ap_i \in \text{Spec } A \cap \text{Spm } A$   
 $(Ap_i)^{\nu_i}$  are  $(Ap_i)$ -primary

so this equality is a primary decomposition of the ideal generated by  $x$  in the module  $A$ , so that is the reason why it is called, (Refer Slide Time: 06:58)

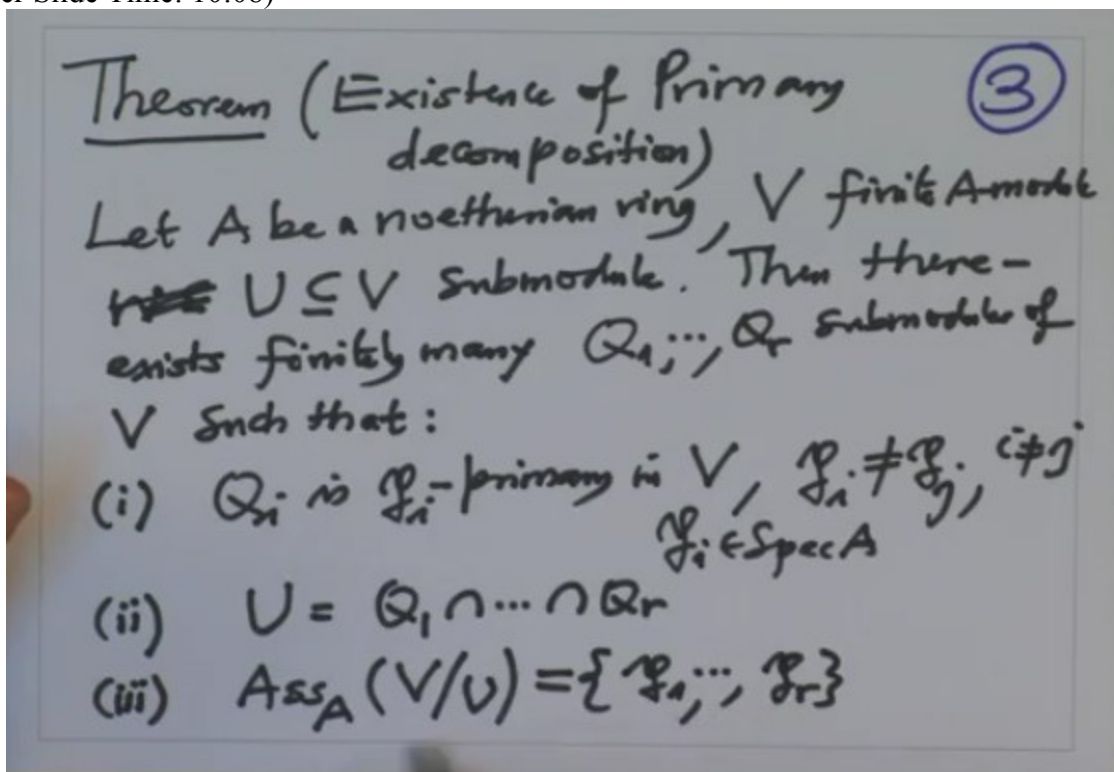

Example  $A$  is a PID ( $A = \mathbb{Z}$  or  $K[x]$  where  $K$  is a field) (2)

$x \in A, x \neq 0$   
 $x = u \cdot p_1^{\nu_1} \cdots p_r^{\nu_r}, u \in A^\times$   
 $p_1, \dots, p_r$  are distinct prime elements,  $\nu_1, \dots, \nu_r \geq 1$   
 $Ax = \bigcap_{i=1}^r (Ap_i)^{\nu_i}$   
 $(Ap_i + Ap_j = A, i \neq j) \iff Ap_i \in \text{Spec } A \cap \text{Spm } A$   
 $(Ap_i)^{\nu_i}$  are  $(Ap_i)$ -primary  
 $\rightarrow$  is a primary decomp.  $Ax$  in  $A$

therefore it is generalization of the prime decomposition. So in a ring, ring may not be UFD but whether the question is whether in general rings ideals in the ring have primary decomposition, and the answer is yes your ring is Noetherian, alright.

Now we prove the existence so that is the theorem, this theorem which is called existence of primary decomposition, and for the proof of this we will use the earlier construction of the associated primes and so on, so let  $A$  be Noetherian,  $A$  be Noetherian ring and  $V$  finite  $A$ -module and  $W$  sub-module or  $U$ ,  $U$  is a sub-module,  $U$  is a sub-module of  $V$ . Then there exists finitely many sub-modules  $Q_1$  to  $Q_r$  sub-modules of  $V$  such that the following holds, such that one  $Q_i$ 's is  $P_i$  prime ideal in  $V$ , and this  $P_i$ 's are different,  $P_i$  not equal to  $P_j$  for  $i \neq j$ , they are prime ideals so  $P_i$ 's are prime ideals in the ring  $A$ , okay, that is one.

Second,  $U$  is intersection of  $Q_1$  to  $Q_r$ , and third the associated primes of  $\frac{V}{U}$  is precisely this set  $P_1$  to  $P_r$ , so if you want to find associated primes you will find the primary decomposition and  
(Refer Slide Time: 10:08)

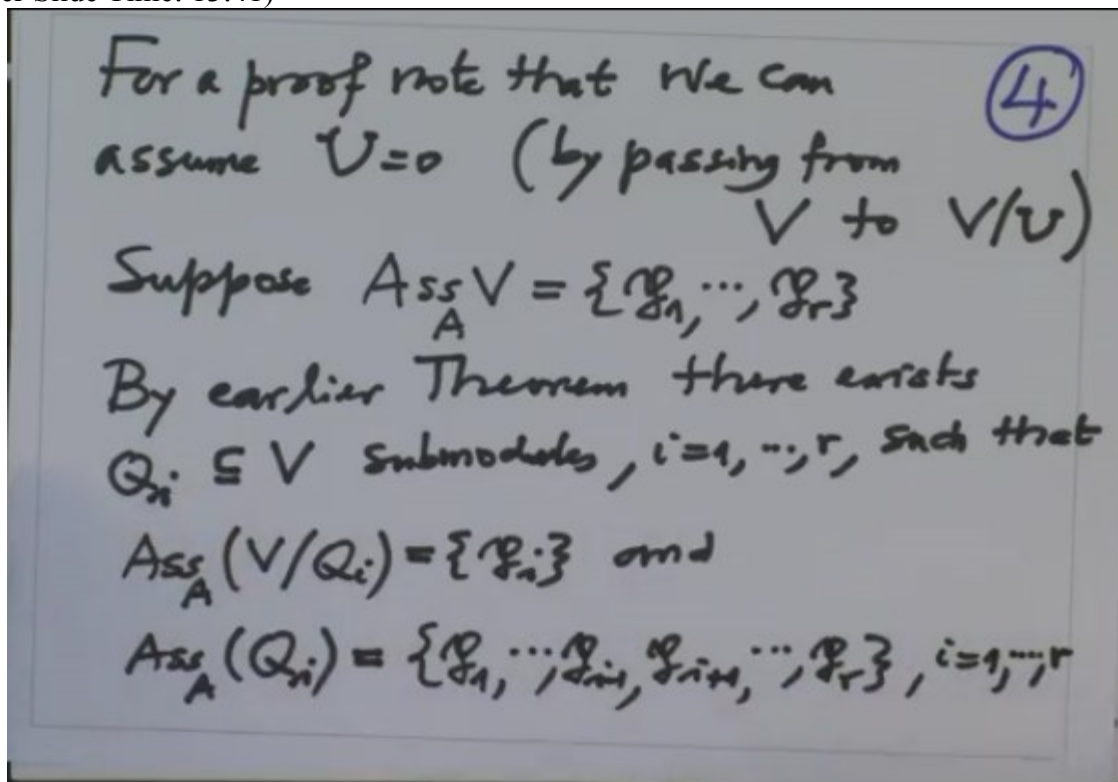

look at their corresponding prime ideals and those will be the associated prime ideals, so this is the theorem we are going to prove, so there will be several steps but all are easy, so for a proof, for a proof note that we can assume  $U$  is 0, this is by passing from  $V$  to the residue class module  $\frac{V}{U}$ , then you can assume  $U$  is 0.

Then when you go mod that then the primary decomposition will be  $\frac{Q_i}{U}$ , alright, then okay, so we can assume  $U$  is 0, now suppose we want to construct this  $Q_i$  right, so suppose now the third condition is associated primes of  $U$  are precisely  $P_1$  to  $P_r$  that means so therefore suppose we know already associated primes of  $V$  these are finitely many prime ideals, so let us say that  $P_1$  to  $P_r$  and then we want to construct  $Q_i$ 's, so that  $Q_i$ 's are  $P_i$  primary and they are different and  $U$  equal to the intersection of  $Q_1$  etcetera  $Q_r$  that is what we want to prove, because we already 3, alright.

Now suppose this then by the earlier theorem I can construct, so by earlier theorem which says that given any subset we can find, given any subset of the associated prime we can find sub-module whose associated primes are precisely the given set, so by earlier theorem there exists for each  $i$ ,  $Q_i$ , sub-module, this is for each  $i = 1$  to  $r$  such that the associated primes of, associated primes of  $\frac{V}{Q_i}$  is precisely the singleton  $P_i$  and associated primes of  $Q_i$  this will be removing  $P_i$ , so this is  $P_1$  to  $P_{i-1}$  and then  $P_{i+1}$ ,  $P_r$ , this is for  $i = 1$  to  $r$ , there exists such a sub-module because that is what we have proved in the earlier theorem that such a sub-module exists.

(Refer Slide Time: 13:41)

Now first note that we have checked that once the associated primes of this is singleton then we have checked that such a module, such a sub-module has to be  $P_i$  primary, so note that then, note that  $Q_i$  is  $P_i$  primary in  $V$ . And now put  $U = Q_1 \cap \dots \cap Q_r$ , and what would we like

to prove? Now we want to prove this  $U$  has to be 0 that is what we want to prove, alright, so to prove  $U$  is 0 this is what we want to prove, alright.

So this is equivalent to proving if I want to prove some sub-module is 0. I want to prove that the associated primes of this  $U$  is empty, is empty set there is no associated prime that's what we are noted when we define associated primes, so we want to show this, okay, alright.

But in any case we know associated primes of  $U$ , this is contained in associated primes of  $Q_i$ , because this is a sub-module of each one of them so this is sub-module, this is associated primes is a subset here, and this  $Q_i$  is a sub module of  $V$  therefore this is a subset of associated prime ideals of  $V$  and this is true for every  $i$ ,  $i$  from 1 to  $r$ .

So if this has some element, so therefore I know there and these we know it is  $P_1$  to  $P_r$ , so therefore if at all this contains, we want to prove it is empty set, if at all it contains some element it must be one of the  $P_i$ , so note that if  $P_i$  belong to associated prime ideals of  $A$  in  $U$ , then  $P_i$  will also belong here, then  $P_i$  will also belong to associated prime ideals of  $Q_i$ , but I know I have chosen  $Q_i$  so that the associated prime ideals of  $Q_i$ , but I know I have chosen  $Q_i$  so that the associated prime ideals of  $Q_i$  are precisely omitting  $P_i$ 's, so this is we know we have chosen  $Q_i$  so that this is  $P_1$  to  $P_{i-1}$ , and then  $P_{i+1}$  to  $P_r$ , so therefore  $P_i$  definitely doesn't belong here, so this is a contradiction, so this means so this proves that associated primes of  $U$  should be empty set and that is equivalent to saying  $U$  is 0 and once  $U$  is 0 we have done, we have proved everything,  
(Refer Slide Time: 17:40)

Then note that  $Q_i$  is  $\mathfrak{P}_i$ -primary (5)  
in  $V$ . Put  $U = Q_1 \cap \dots \cap Q_r$ .

To prove  $U=0 \iff \text{Ass}_A U = \emptyset$

$\text{Ass}_A U \subseteq \text{Ass}_A Q_i \subseteq \text{Ass}_A V, i=1, \dots, r.$

$\text{Ass}_A V = \{\mathfrak{P}_1, \dots, \mathfrak{P}_r\}$

If  $\mathfrak{P}_i \in \text{Ass}_A U$ , then  $\mathfrak{P}_i \in \text{Ass}_A Q_i = \{\mathfrak{P}_1, \dots, \mathfrak{P}_i, \dots, \mathfrak{P}_r\}$   
a contradiction. This proves that

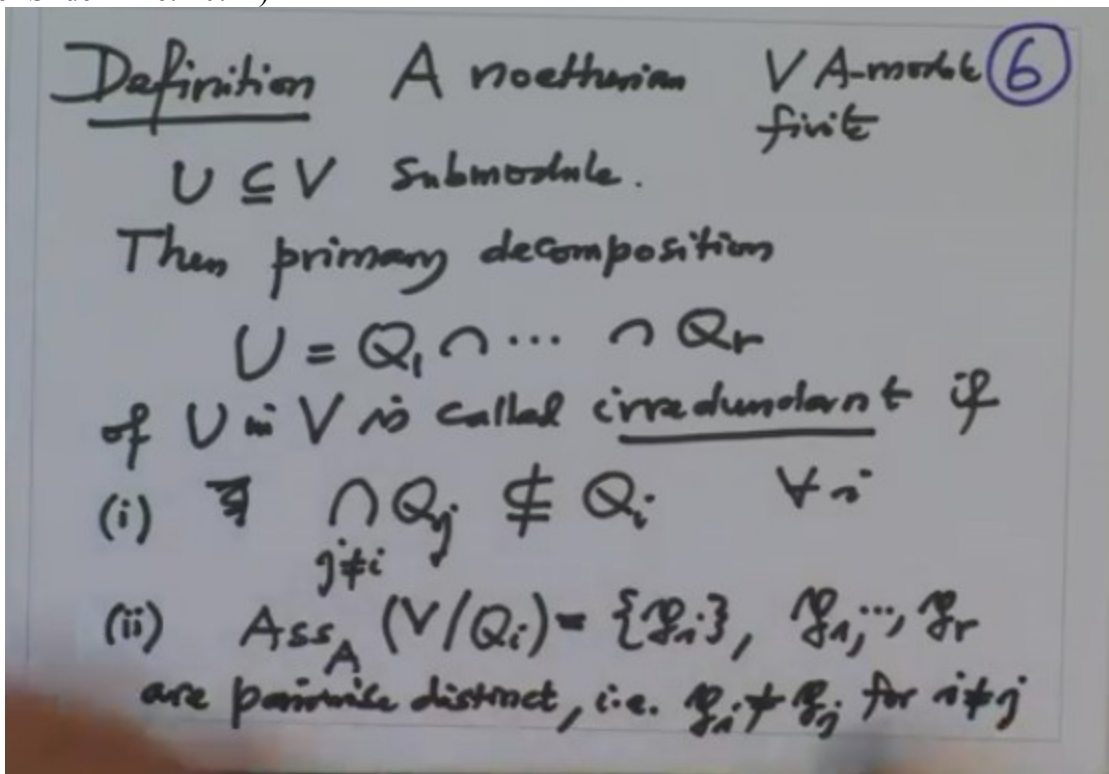

$\text{Ass}_A U = \emptyset \iff U=0$

so that proves existence, alright, so these two like distance.

Now the next job is to find the uniqueness, alright. So now we are precisely defining what does one mean by the uniqueness, so let us define, so this is a definition so this will tell more precisely what does one should mean by uniqueness of the decomposition, so again A Noetherian ring, remember that our assumption is V is finite module, so V A-module finite and U is a sub-module of V, sub-module and we are talking about primary decomposition of U in V, and its uniqueness, so the primary decomposition  $U = Q_1 \cap \dots \cap Q_r$  of U in V is called irredundant, irredundant if all necessary that means what, so if the two conditions one there is, there exist so intersection of  $Q_i, Q_j, j \neq i$  this is not contained in  $Q_i$  for every i, for every I this thing happens, that means this  $Q_i$  is really necessary in this intersection.

And second condition the associated primes of  $\frac{V}{Q_i}$  this is singleton  $P_i$ , and this  $P_i$  to  $P_r$  are pair wise distinct, that means so that is  $P_i \neq P_j$  for  $i \neq j$ , then we only say that it is irredundant, that means all the P's are different (Refer Slide Time: 20:41)

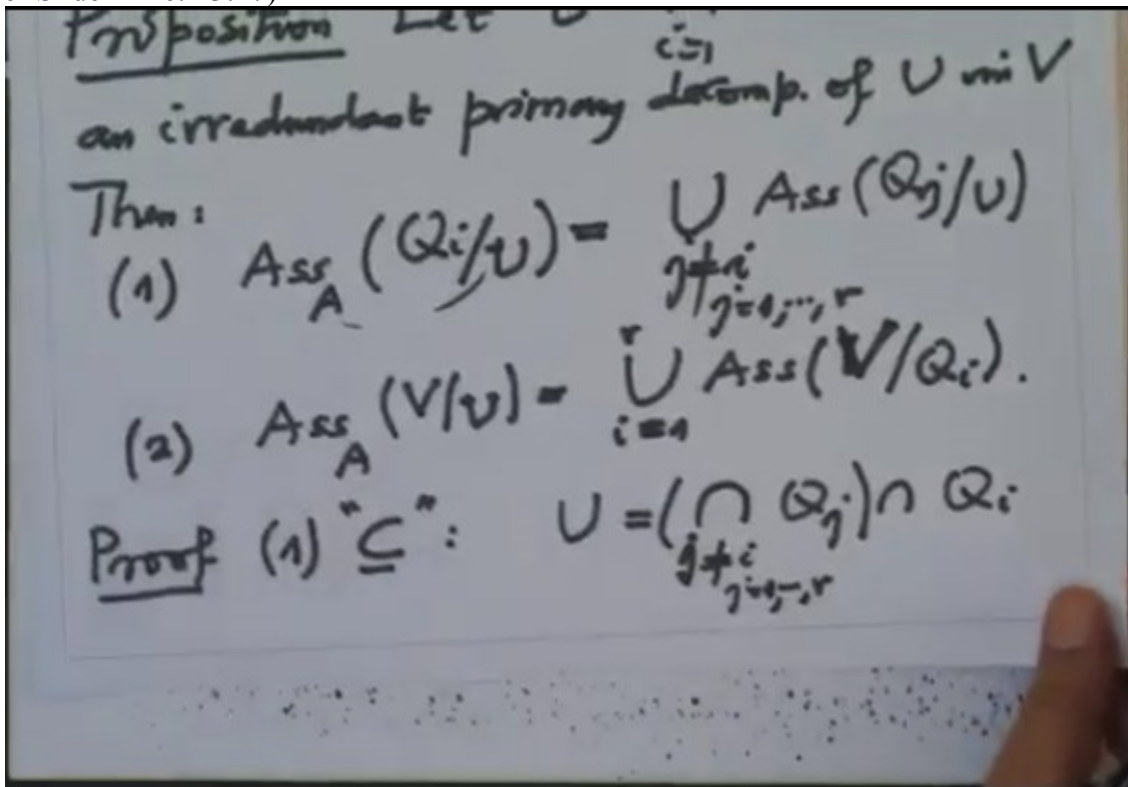

and all the capital Q's they are needed to in the intersection.

Now let us prove a proposition, so proposition, so let  $U = \bigcap Q_i$ , i is from 1 to r be an irredundant primary decomposition of U in V, V is a finite module over Noetherian ring, and this is a primary decomposition, then one the associated prime ideals of  $\frac{Q_i}{U}$ , this is the union of the associated prime ideals of  $Q_j \text{ mod } U$ , where j is running not equal to i, and j is from 1 to r,

alright then B, 2, the associated prime ideals of  $\frac{V}{U}$  is precisely the union of associated prime ideals of  $\frac{V}{Q_i}$ , if it is irredundant then this must be, this two equalities, so proof so each are equality, so one I would like to prove one inclusion at a time and then the other inclusion another time, okay, so I'm proving one and that two this inclusion, this inclusion in prime, that means every element of this should be an element in this union that is what I want to prove.

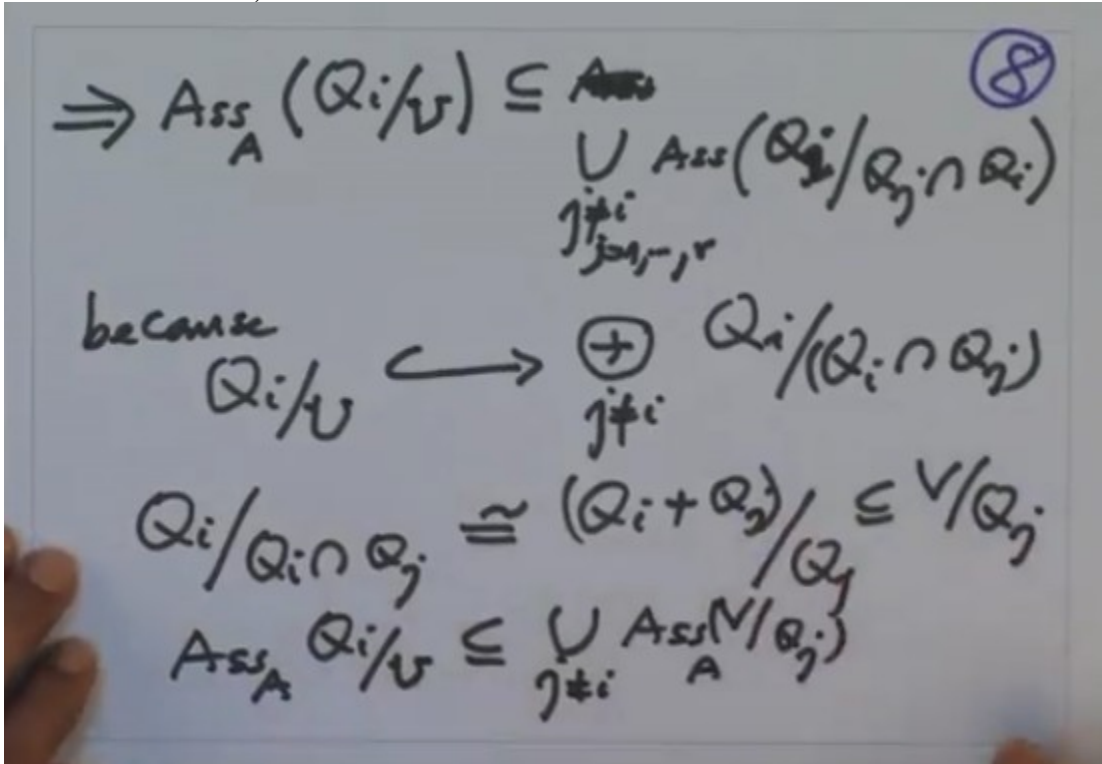

So alright, so let us take the given U is, U take intersection over j,  $j \neq i$  and then  $Q_j$ , and then intersection with  $Q_i$ , so I have separated of the time, because I want to prove that if somebody an element here, then it is here, so this j is from 1 to r, so this I just rearranged it, (Refer Slide Time: 23:47)

so because of this what do I know? This U is equal to the intersection of this two sub-modules therefore if I want to look at the associated primes, so therefore associated primes of  $\frac{Q_i}{U}$  this is contained in associated primes of, I have to take union, union over  $j \neq i$  j is from 1 to r, associated prime ideals of  $\frac{Q_j}{Q_j \cap Q_i}$ , since because this inclusion follows because I have the inclusion map from  $\frac{Q_i}{U}$  to the direct sum  $\frac{Q_i}{Q_i \cap Q_j}$ , and this is running over  $j \neq i$ , and here also this should be the i.

So this is clearly an inclusion because if somebody goes to 0 here, that's in the intersection of each one of them therefore it is, so that is easy to see, therefore if I look at  $Q_i$ , this one

$\frac{Q_i}{Q_i \cap Q_j}$ , this is isomorphic to  $\frac{Q_i + Q_j}{Q_j}$  which is a sub of  $\frac{V}{Q_j}$  therefore this one is clear,  
 therefore associated prime ideals of  $\frac{Q_i}{U}$ , this is contained in the union, union  $j \neq i$   
 associated prime ideals of  $\frac{P}{Q_j}$ , so that proves one inclusion,  
 (Refer Slide Time: 26:20)

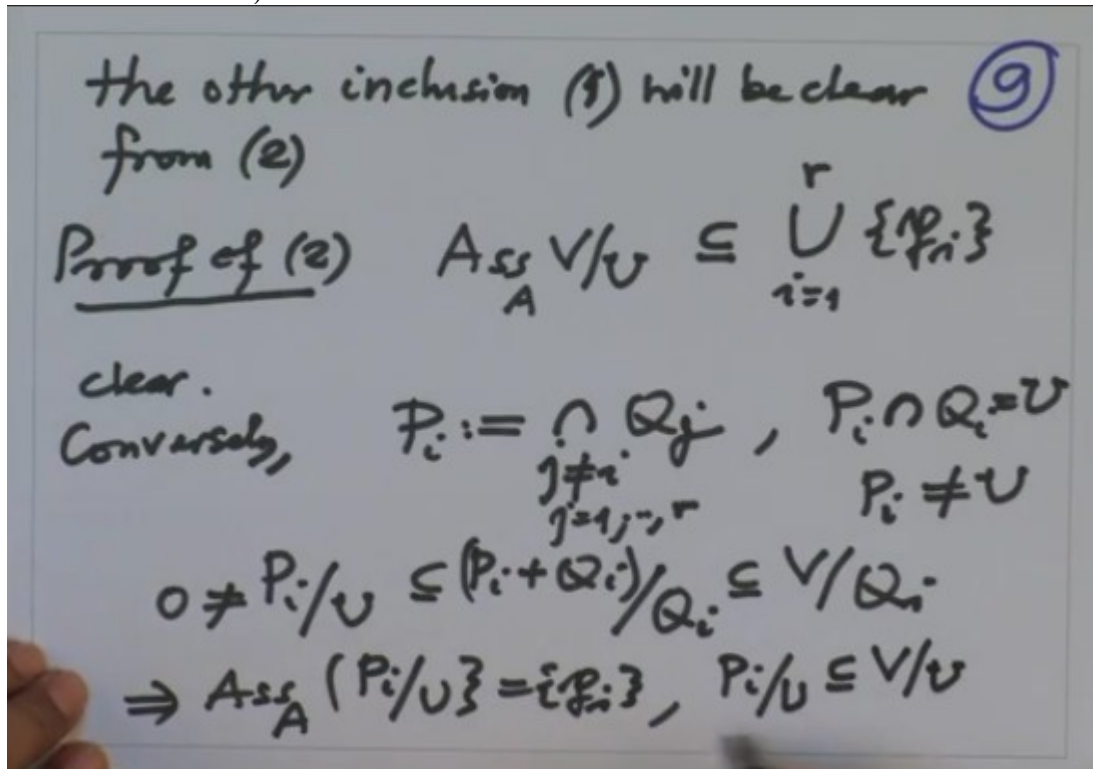

and the other inclusion is will be clear by 2, so I just want to prove 2, so the other inclusion in one will be clear from 2, so proof of 2, alright, proof of 2, alright.

So what is that we want to prove? We want to prove that the associated prime ideals of  $\frac{V}{U}$  is contained in the union, so look at the associated prime ideals of  $\frac{V}{U}$ , we want to prove that this is contained in union, union is from  $i = 1$  to  $r$  and associated prime ideals of  $\frac{V}{Q}$  as singletons, they are singletons  $P_i$ 's because  $Q_i$ 's are  $P_i$  primary, so this on the other side so this is clearly contained there, now other inclusion, so this is clear, this is clear, on the other conversely if you put  $P_i = \text{intersection } Q_i$ , now this is running over  $Q_j$ ,  $j$  is running,  $j \neq i$   $j$  is from 1 to  $r$ , then  $P_i \cap Q_i$  is given  $U$ , and  $P_i \neq U$  because it was irredundant primary decomposition and again therefore  $P_i/U$  this is nonzero, and this is contained in  $\frac{P_i + Q_i}{Q_i}$  which is contained in  $\frac{V}{Q_i}$ , and therefore we get associated prime ideals of  $\frac{P_i}{U}$  is singleton  $P_i$ ,

and because  $\frac{P_i}{U}$  is contained in  $\frac{V}{U}$  therefore all this  $P_i$ 's,  $P_i$ 's belong to the associated prime ideals of  $\frac{V}{U}$ ,

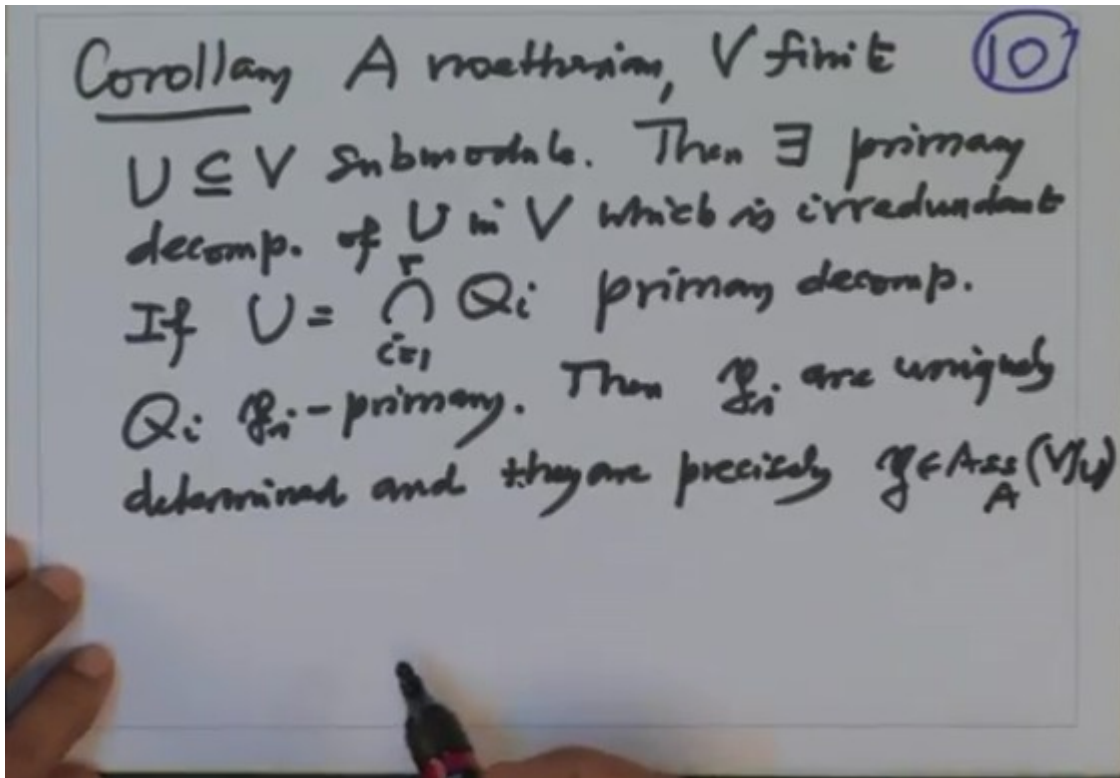

(Refer Slide Time: 29:19)

so we have proved that equality here, so that proves equality here and that proves the proposition and therefore we prove that irredundant primary decomposition exist, and we will still reduce one corollary from this, that means write that corollary because corollary, so A Noetherian ring, A Noetherian, we finite A module and U is a sub module, then there exists a primary decomposition of U in V, which is irredundant.

So in fact what do we do is, so if U is intersection  $Q_i$  this is a primary decomposition, primary decomposition,  $Q_i$  is  $P_i$  primary, then  $P_i$ 's are uniquely determined, and they are, they belong to, and they are precisely elements P in the associated prime ideals of  $\frac{V}{U}$ ,

(Refer Slide Time: 31:44)

so that proves the irredundant primary decomposition of a sub-module exists in a finite module and maybe in the next time I'll deduce the uniqueness, what no one mean by the uniqueness of the primary components, so we will do that in the next time. Thank you very much.
