**Lecture - 6.4**  
**Laplace Equation**

Welcome to this lecture on weak maximum principle and its applications. The outline for today is first we introduce weak maximum principle and prove it and then we look at some consequences of weak maximum principle we will discuss weak maximum principle only for domains in  $\mathbb{R}^2$  for  $\mathbb{R}^n$  it is similar.

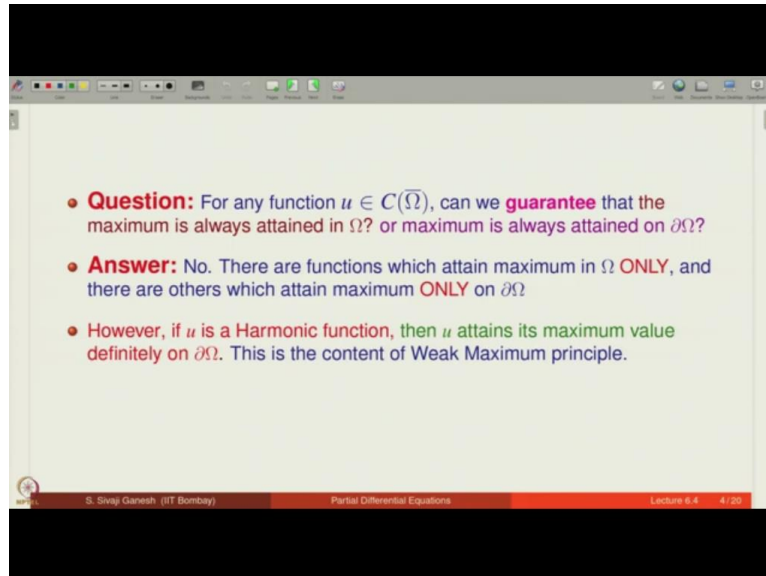

**(Refer Slide Time: 00:38)**

So, let  $\Omega$  inside  $\mathbb{R}^2$  be a bounded domain. Let  $u$  be a continuous function defined on  $\Omega$  such that  $u$  can be extended to the closure of  $\Omega$  as a continuous function. That means,  $u$  makes sense for points on the boundary of  $\Omega$  and that too in a continuous manner. So, a collection of such functions is denoted by  $C$  of  $\bar{\Omega}$  or  $\Omega$  closure when  $\Omega$  is bounded every function in  $C$  of  $\bar{\Omega}$  attains both its maximum.

And minimum values because  $\bar{\Omega}$  is a compact set continuous function and a compact set attains both minimum and maximum values, but somewhere in  $\bar{\Omega}$  the location is not known, but somewhere in  $\bar{\Omega}$  definitely both maximum and minimum values are attained.

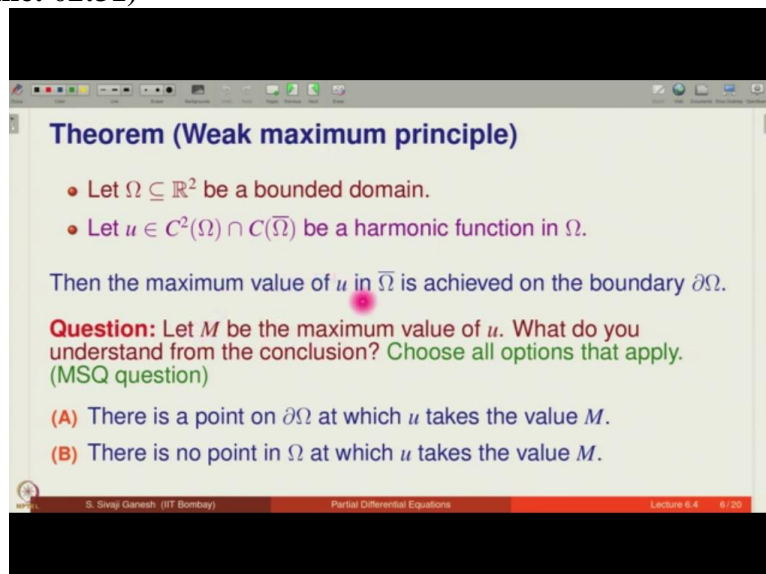

**(Refer Slide Time: 01:32)**

Now, we have a question for any function  $u$  that is for any given function  $u$  in  $C$  of  $\Omega$  bar, can we guarantee that the maximum is always attained in the domain  $\Omega$  or maximum is always attained on boundary of  $\Omega$ . So, can we answer this question for any arbitrary continuous function on  $\Omega$  closer? Answer no, we cannot say this, because there are functions which attain maximum in  $\Omega$  only and not on the boundary.

And there are others which attain maximum only on the boundary of  $\Omega$  not in  $\Omega$ . However, if  $u$  is a harmonic function that is  $u$  is a solution of Laplacian  $u = 0$  then  $u$  attains its maximum value definitely on boundary of  $\Omega$ . This is a content of weak maximum principle. So, let us describe, what is weak maximum principle?

**(Refer Slide Time: 02:31)**

Let us take it as a theorem proof is very simple, let  $\Omega$  inside  $\mathbb{R}^2$  be a bounded domain, let  $u$  be in  $C^2$  of  $\Omega$  intersection  $C$  of  $\Omega$  bar and  $u$  is a harmonic function in  $\Omega$ ,

then the maximum value of  $u$  in  $\Omega$  is achieved on the boundary  $\partial\Omega$ . We have a question here, let  $M$  be the maximum value of  $u$  on  $\partial\Omega$ . What do you understand from the conclusion of this weak maximum principle which is here?

Choose all options that apply, it is a MSQ question, which you are already very familiar with that means more than 1 answer can be correct. First option, A is there is a point on boundary of  $\Omega$  at which  $u$  takes the value  $M$ . second option, there is no point in  $\Omega$  at which  $u$  takes the value  $M$ . Definitely the conclusion is saying that maximum value of  $u$  in  $\Omega$  is achieved on the boundary that means, there is a point on the boundary at which  $u$  takes a value  $m$ .

So, A is correct, what about B? B is correct or not? B is true or false? When we write statements in English, we have to be very careful that the maximum value of  $u$  is achieved on the boundary. So, if you put extra emphasis on this word is, it is achieved on the boundary that gives an impression that it is not achieved in  $\Omega$ , whereas the statement does not say so, you are likely to tick B also, but that is not true.

There are harmonic functions, which are time maximum inside  $\Omega$  as well as on the boundary of  $\Omega$  as guaranteed by this theorem. So, you have to be very careful with the conclusions which are written in a language like this, you should not give extra emphasis on these kinds of words in the language. Be careful we have come across such statements in the first order PDEs also.

**(Refer Slide Time: 04:32)**

**Proof of Weak maximum principle**

**Step 1:**

- If a function  $u$  has a local maximum at a point  $P \in \Omega$ , then
$$\frac{\partial^2 u}{\partial x^2}(P) \leq 0, \quad \frac{\partial^2 u}{\partial y^2}(P) \leq 0.$$
- As a consequence,  $\Delta u(P) \leq 0$ .
- Thus if  $v$  is a function such that  $\Delta v > 0$  in  $\Omega$ , then the maximum value of  $v$  on  $\bar{\Omega}$  cannot be attained in  $\Omega$ .
- Hence  $v$  attains its maximum value only on the boundary  $\partial\Omega$ .
- This is the main idea in the proof of Weak maximum principle.

S. Swaj Ganesh (IIT Bombay) Partial Differential Equations Lecture 6.4 7/20

Proof of weak maximum principle step 1, if a function  $u$  has a local maximum at a point in  $\omega$ ,  $\omega$  is an open set. Then, the second order partial derivatives are always less than or equal to 0. So  $\frac{\partial^2 u}{\partial x^2}$  at the point  $P$  as well as  $\frac{\partial^2 u}{\partial y^2}$  at the point  $P$  is less than or equal to 0. Both of them are less than or equal to 0 as a consequence Laplacian  $u$  at the point  $P$  is less than or equal to 0.

Because Laplacian  $u$  after all by definition is  $u_{xx}$  at  $P$  +  $u_{yy}$  at  $P$  both of them are less than or equal to 0. Therefore, Laplacian  $u$  at  $P$  is less than or equal to 0. Thus if  $v$  is a function such that Laplacian  $v$  is positive in  $\omega$  that means, this kind of condition cannot be satisfied by  $v$  Laplacian  $v$  at  $P$  is always greater than 0. Therefore, it is never less than or equal to 0. Therefore, we can conclude that maximum value of  $v$  on  $\omega$  is never achieved in  $\omega$  it is achieved in boundary of  $\omega$ .

Because it is definitely achieved somewhere in  $\omega$  closure it is not achieved in  $\omega$  therefore, it has to attain on the boundary of  $\omega$  this is the main idea in the proof of weak maximum principle what we are given is a harmonic function. So, Laplacian  $u = 0$  therefore, this idea cannot be implemented straight away. So, we construct a  $v$  such that Laplacian  $v$  is positive and hence  $v$  has a maximum on the boundary of  $\omega$  and using that information we show that  $u$  also has maximum on the boundary of  $\omega$ .

**(Refer Slide Time: 06:15)**

**Proof of Weak maximum principle (continued)**  
**Step 2:**

- Define the function  $v_\epsilon$  by
 
$$v_\epsilon(x, y) := u(x, y) + \epsilon(x^2 + y^2).$$
- Then  $v_\epsilon \in C^2(\Omega) \cap C(\bar{\Omega})$ .  $\Delta v_\epsilon > 0$  in  $\Omega$
- Thus  $v_\epsilon$  attains its maximum only on the boundary  $\partial\Omega$ .
- Denoting
 
$$M := \max_{\partial\Omega} u, \quad L := \max_{\partial\Omega} (x^2 + y^2),$$
 we have
 
$$v_\epsilon(x, y) \leq M + \epsilon L, \quad \forall (x, y) \in \Omega.$$

So, define the function  $v = u + \epsilon(x^2 + y^2)$ . So, when  $\epsilon = 0$  you are at  $u$ . So, this is you can think these are perturbation of this function, but what kind of perturbation? I am going to consider the  $\epsilon$  positive  $x^2 + y^2$

is always greater than or equal to 0, therefore, this term is always greater than or equal to 0, in particular,  $v_\epsilon$  of  $x, y$  is always greater than or equal to  $u$  of  $x, y$ .

We will use this observation later and  $v_\epsilon$  is a  $C^2$  function in the domain  $\Omega$  because  $u$  is a  $C^2$  function. What we are adding is definitely a  $C^2$  function for the same reason  $v_\epsilon$  is also  $C^2$  of  $\bar{\Omega}$  the reason being that  $u$  is in  $C^2$  of  $\bar{\Omega}$  this function is continuous everywhere in  $\mathbb{R}^2$  in particular and  $\bar{\Omega}$ . So, Laplacian  $v_\epsilon$  is positive, because what is the Laplacian  $v_\epsilon$  is the Laplacian  $u$  plus Laplacian of this, what is the Laplacian of this? It is  $\epsilon$  times Laplacian of this.

So,  $v_\epsilon$  having this property that Laplacian  $v_\epsilon$  is positive in  $\Omega$  it attains its maximum only on the boundary of  $\Omega$  let us denote by  $M$  maximum of  $u$  on the boundary and the  $L$  to be maximum of  $x^2 + y^2$  on the boundary. So, we have  $v_\epsilon$  of  $x, y$  less than or equal to  $M + \epsilon L$  for every  $x, y$  in  $\Omega$ . Why is that? Because  $M + \epsilon L$  is precisely the maximum of  $v_\epsilon$  on maximum  $v_\epsilon$  is maximum of  $u$  plus maximum of  $\epsilon$  times maximum of  $x^2 + y^2$ .

That is the reason, because we have observed that  $v_\epsilon$  maximum is attained only on the boundary. So, therefore, the values of  $v_\epsilon$  for  $x, y$  in  $\Omega$  is always less than or equal to maximum of  $v_\epsilon$  on the boundary of  $\Omega$  which is less than or equal to  $M + \epsilon L$ .

**(Refer Slide Time: 08:35)**

**Proof of Weak maximum principle (conclusion)**

$$v_\epsilon(x, y) := u(x, y) + \epsilon(x^2 + y^2).$$

- Since  $u(x, y) \leq v_\epsilon(x, y)$  for all  $(x, y) \in \Omega$ , we have
 
$$u(x, y) \leq M + \epsilon L, \quad \forall (x, y) \in \Omega.$$
- Note that last inequality holds for every  $\epsilon > 0$ . Taking limit as  $\epsilon \rightarrow 0$ , we get
 
$$u(x, y) \leq M, \quad \forall (x, y) \in \Omega.$$
- This finishes the proof. □

S. Sivaji Ganesh (IIT Bombay) Partial Differential Equations Lecture 6.4 9/20

Since  $u(x, y)$  is less than or equal to  $v(x, y) + \epsilon$ , because this is what we are adding is nonnegative quantity. So,  $\epsilon$  is positive, therefore, we have this inequality. And  $v(x, y) + \epsilon$ , we know is less than or equal to  $M + \epsilon$ , therefore,  $u$  is less than or equal to  $M + \epsilon$  for every  $x, y$  in  $\Omega$ . Note that the last inequality holds for every  $\epsilon$  positive and decide there is no  $\epsilon$ .

So, as  $\epsilon$  goes to 0, what we get is  $u(x, y)$  is less than or equal to  $M$  and that is what we want to show. What is  $M$ ? It is the maximum of  $u$  on the boundary. So, what we have shown by this inequality is the value of  $u$  at any point in  $\Omega$  is less than or equal to the maximum value of  $u$  on the boundary. In other words, maximum is definitely achieved on the boundary that completing the proof of weak maximum principle.

**(Refer Slide Time: 09:37)**

**Corollary (Weak minimum principle)**

- Let  $\Omega \subseteq \mathbb{R}^2$  be a bounded domain.
- Let  $u \in C^2(\Omega) \cap C(\bar{\Omega})$  be a harmonic function in  $\Omega$ .

Then the minimum value of  $u$  in  $\bar{\Omega}$  is achieved on the boundary  $\partial\Omega$ .

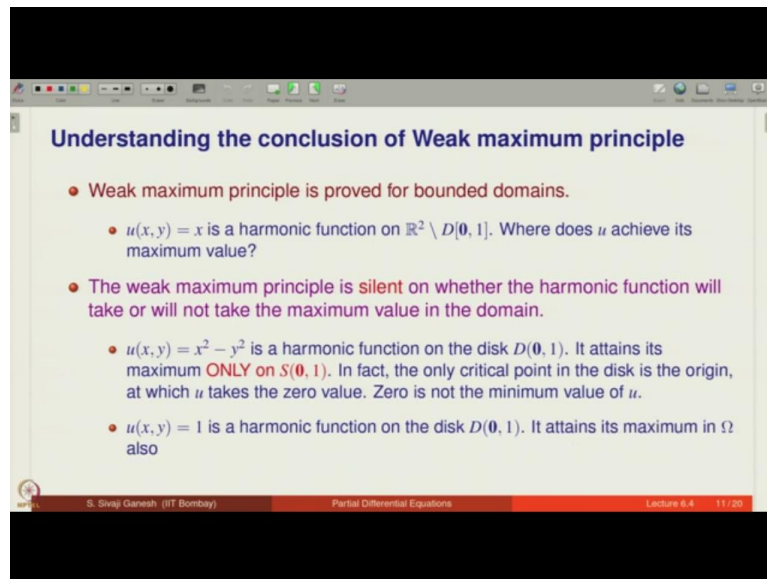

**Proof.**

- Define by  $v(x, y) = -u(x, y)$  on  $\Omega$ .
- Then  $v$  is a harmonic function.
- Apply the weak maximum principle to the harmonic function  $v$  and conclude.  $\square$

S. Shivaji Ganesh (IIT Bombay) Partial Differential Equations Lecture 6.4 10/20

A quick corollary of weak maximum principle is what is called weak minimum principle. Let  $\Omega$  be a bounded domain in  $\mathbb{R}^2$ . Let  $u$  be  $C^2$  of  $\Omega$  intersection  $C$  of  $\Omega$  bar and harmonic function, then the minimum value of  $u$  in  $\Omega$  bar is achieved on the boundary. Proof is very simple if  $u$  is a harmonic function minus  $u$  is also a harmonic function. So let us consider  $v = -u$ , then  $v$  is a harmonic function, apply the weak maximum principle to the harmonic function  $v$  and conclude. So make drawing the conclusion is left an exercise to you it is a very simple thing.

**(Refer Slide Time: 10:18)**

So let us understand the conclusion of weak maximum principle. What does it say and what it does not say. So, weak maximum principle is proved for bounded domains; that is to be remembered. Look at this function  $u$  of  $x, y = x$ . Of course, it is a harmonic function Laplacian  $u$  is 0. Throughout  $\mathbb{R}^2$ , but I am now considering this only on this domain  $\mathbb{R}^2$  from which I have removed the closed disk with center at origin and radius 1.

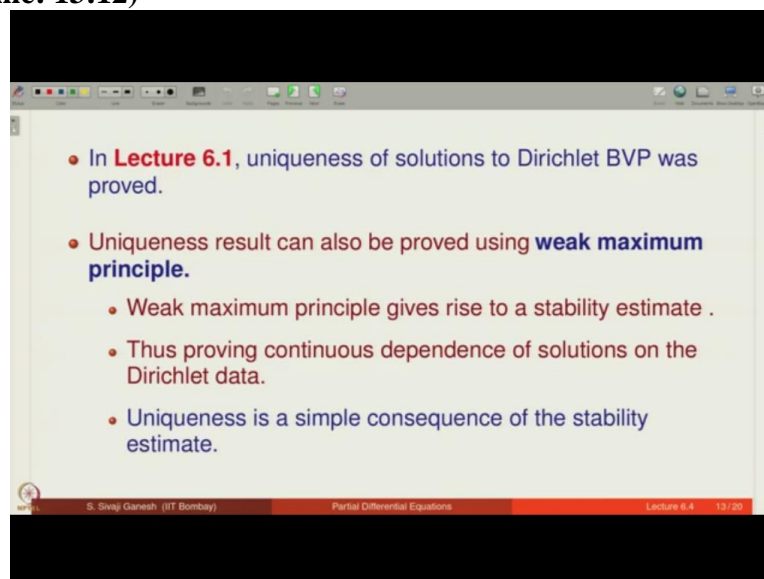

So, this is not a bounded domain, in fact, is what is called an exterior domain as we discussed earlier, where does  $u$  achieve its maximum value? Of course,  $u$  does not have a maximum at all. The weak maximum principle is silent on whether the harmonic function will take or will not take the maximum value in the domain is always saying maximum value is taken on the boundary, but never says a sentence about what happens in  $\Omega$ .

Let us look at this function  $u$  of  $x, y = x^2 - y^2$  these are harmonic function is a polynomial. So this is also called harmonic polynomial sometimes. It is harmonic function everywhere, because Laplacian,  $u$  will be  $2 - 2$  that will be 0. So Laplacian  $u$  is 0 everywhere, but I consider as  $D(0, 1)$  the disk of radius 1 with center at the origin, it attains its maximum only on the circle as  $S(0, 1)$ .

Why is that? If at all it attains maximum inside the open disk, we know that derivative of this function must be 0 gradient must be 0. What is the gradient of this function? It is  $2x, 2y$  where is it 0 at the origin. So at the origin value is actually  $u$  of  $x, y = 0$  at the origin, but 0 is not maximum. Because clearly, you can see, if you are looking at the point  $u$  of  $1, 0$ , that is actually 1 thus, 0 is not a maximum value similarly it is not a minimum value also.

So the only critical point that is where the gradient is 0, by definition in the disk is the origin at which  $u$  takes 0 value, 0 is not the minimum value of  $u$  also. So these are function where maximum minimum is not attained inside the disk, it is attained only on the boundary. On the other hand, if you look at  $u$  of  $x^2 + y^2 = 1$ , it is a harmonic function, it is a constant function. So maximum and minimum both are 1, it is assumed everywhere in the domain as well as on the boundary. Let us look at some consequences of weak maximum principle.

**(Refer Slide Time: 13:12)**

Let us look at some consequences of weak maximum principle. In lecture 6.1, uniqueness of solutions to Dirichlet boundary value problem was proved. In fact, we proved uniqueness for the Robin boundary value problem and Dirichlet boundary value problem turned out to be a special case. Uniqueness result can also be proved using weak maximum principle. In fact, weak maximum principle, because it says maximum of  $u$  is attained on the boundary.

It compares 2 quantities, maximum of  $u$  in  $\Omega$  is less than or equal to maximum of  $u$  on the boundary. Because it is in the form of inequality, we get some estimates. So weak maximum principle gives rise to a stability estimate. We are going to see that so that is proving continuous dependence of solutions on the Dirichlet boundary data. Uniqueness is a simple consequence of the stability estimate.

**(Refer Slide Time: 14:04)**

**Theorem (Stability estimate)**

- Let  $\Omega \subseteq \mathbb{R}^2$  be a bounded domain.
- For  $i = 1, 2$ , let  $u_i \in C^2(\Omega) \cap C(\bar{\Omega})$  solve the Dirichlet BVPs on  $\Omega$ :
 
$$\Delta u_i = f \text{ on } \Omega,$$

$$u_i = g_i \text{ on } \partial\Omega,$$
 where  $g_i$  is a continuous function on  $\partial\Omega$  for each  $i = 1, 2$ .

Then the following stability estimate holds:

$$\max_{\bar{\Omega}} |u_1(x, y) - u_2(x, y)| \leq \max_{\partial\Omega} |g_1(x, y) - g_2(x, y)|.$$

S. Sivaji Ganesh (IIT Bombay) Partial Differential Equations Lecture 6.4 14/20

Let us state the stability estimate let  $\Omega$  inside  $\mathbb{R}^2$  be a bounded domain and for  $i = 1$  to  $2$ , let  $u_i$  be  $C^2(\Omega) \cap C(\bar{\Omega})$  solve the Dirichlet problem with right hand side same right hand side  $f$  and  $g_i$  has the boundary data. Then the following stability estimate holds that is maximum of  $|u_1(x, y) - u_2(x, y)|$  as  $x, y$  vary in  $\bar{\Omega}$  is less than or equal to maximum over boundary of  $|g_1(x, y) - g_2(x, y)|$ . If you want this is the distance between the Dirichlet data and this is the distance between the solutions in  $\bar{\Omega}$ .

**(Refer Slide Time: 14:53)**

**Proof of Theorem**

Define  $w := u_1 - u_2$ . Then  $w$  solves the following Dirichlet problem

$$\Delta w = 0 \text{ on } \Omega,$$

$$w = g_1 - g_2 \text{ on } \partial\Omega.$$

Applying the weak maximum principle, we get

$$w(x, y) \leq \max_{\partial\Omega} (g_1 - g_2) \leq \max_{\partial\Omega} |g_1 - g_2| \quad \forall (x, y) \in \Omega.$$

On noting that  $-w$  also satisfies a BVP as above, on applying the weak maximum principle yields

$$-w(x, y) \leq \max_{\partial\Omega} (g_2 - g_1) \leq \max_{\partial\Omega} |g_1 - g_2| \quad \forall (x, y) \in \Omega.$$

Stability estimate follows from the last two inequalities.

S. Sivaji Ganesh (IIT Bombay) Partial Differential Equations Lecture 6.4 15/20

So, define  $w = u_1 - u_2$  look at what problem  $w$  solves Laplacian  $w$  is  $0$ . Because Laplacian of  $u_1$  as well as Laplacian of  $u_2$  is  $f$  and  $w = g_1 - g_2$  on boundary of  $\Omega$ . Applying the weak maximum principle, we get  $w(x, y)$  is less than or equal to maximum of the Dirichlet data the boundary data on the boundary. Because  $w$  is a harmonic function maximum is attained on the boundary.

Therefore, we have this inequality of course, this is less than or equal to maximum boundary of  $\omega$  mod  $g_1 - g_2$  because  $g_1 - g_2$  is always less than or equal to mod  $g_1 - g_2$ . On noting that minus  $w$  also satisfies a BVP as above what does minus  $w$  satisfy Laplacian minus  $w = 0$  and minus  $w = g_2 - g_1$  unbound. So, we can apply weak maximum principle for minus  $w$  and what is a boundary data for minus  $w$   $g_2 - g_1$ .

So, therefore, weak maximum principle gives this now, we know  $g_2 - g_1$  is less than or equal to mod  $g_2 - g_1$ , which is same as mod  $g_1 - g_2$ . Therefore, we have this now, what do we have  $w$  of  $x, y$  is less than or equal to a certain quantity minus  $w$  of  $x, y$  is also less than or equal to the same quantity for every  $x, y$  in  $\omega$ . If a number and a negative of that number both of them are less than or equal to the same quantity it means, the modulus of this number namely mod  $w$  of  $x, y$  is less than or equal to that number. So stability estimate follows from the last 2 inequalities.

**(Refer Slide Time: 16:35)**

**Uniqueness of solutions to Dirichlet BVP**

- Let  $\Omega \subseteq \mathbb{R}^2$  be a bounded domain
- Consider the Dirichlet problem on  $\Omega$ :
 
$$\begin{aligned} \Delta u &= f \text{ on } \Omega, \\ u &= g \text{ on } \partial\Omega, \end{aligned}$$
 where  $g$  is a continuous function on  $\partial\Omega$ .

Then the Dirichlet problem has at most one solution in the class  $C^2(\Omega) \cap C(\bar{\Omega})$ .

S. Sivaji Ganesh (IIT Bombay) Partial Differential Equations Lecture 6.4 16 / 20

Now, let us look at uniqueness of solutions to the Dirichlet bounded value problem. Let  $\omega$  be a bounded domain in  $\mathbb{R}^2$  and consider this Dirichlet problem. We want to show uniqueness how do we show that? We have to take  $u_1, u_2$  satisfying this boundary value problem, subtract look at the boundary value problem that is solved by the difference if  $u_1$  and  $u_2$  are solutions to this problem,  $u_1 - u_2$  let us call it  $w$  it satisfies Laplacian  $w = 0$  and  $w = 0$  on the boundary. So, from the stability estimate, we get the uniqueness of solutions to Dirichlet boundary value problem.

**(Refer Slide Time: 17:19)**

**Remark on Uniqueness result**

- Recall that the uniqueness result was already proved in **Lecture 6.1**.
- Recall that its proof required that  $\partial_n u$  be defined on the boundary, and thus the uniqueness result could be proved only for  $u \in C^1(\bar{\Omega})$ .
- Thanks to maximum principle, uniqueness result is valid for any harmonic function which belongs to the space  $C(\bar{\Omega})$ .

S. Sivaji Ganesh (IIT Bombay) Partial Differential Equations Lecture 6.4 17/20

Remark on uniqueness result, recall that the uniqueness result was already proved in lecture 6.1. Recall that its proof required that the normal derivative of  $u$  is defined on the boundary and thus uniqueness result could only be proved for  $u$  in  $C^1$  of  $\bar{\Omega}$ . That is  $u$  in  $C^2$  of  $\Omega$  intersection  $C^1$  of  $\bar{\Omega}$ . Thanks to maximum principle uniqueness result is valid for any harmonic function which belongs to the space  $C$  of  $\bar{\Omega}$ . In other words,  $C^2$  of  $\Omega$  intersection  $C$  of  $\bar{\Omega}$ . Here I am mentioning only the smoothness what is required on the boundary in the domain of course,  $u$  is in  $C^2$  of  $\Omega$ .

**(Refer Slide Time: 18:08)**

**Uniqueness result does NOT hold on Unbounded domains**

Consider the Dirichlet BVP posed on the upper half plane:

$$\Delta u(x, y) = 0 \text{ for } x \in \mathbb{R}, 0 < y < \infty,$$

$$u(x, 0) = 0 \text{ for all } x \in \mathbb{R}.$$

The BVP has at least two solutions.

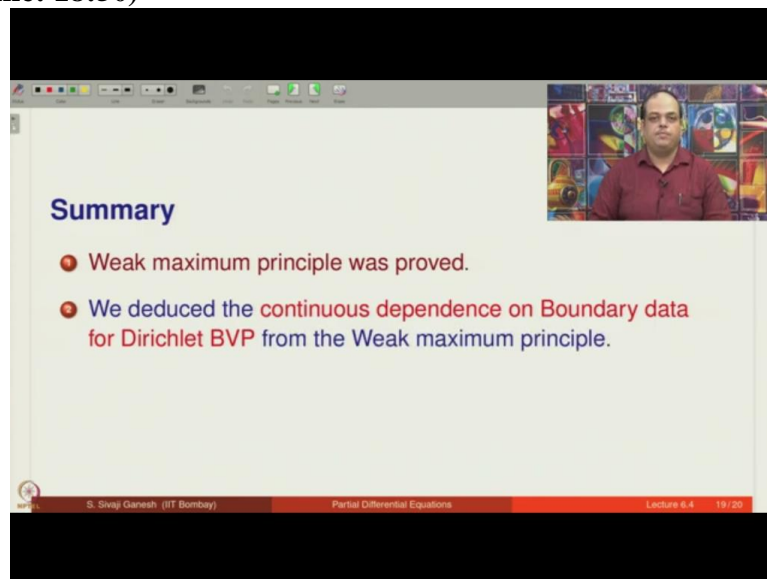

$$u_1(x, y) = xy, \quad u_2(x, y) = 0.$$

S. Sivaji Ganesh (IIT Bombay) Partial Differential Equations Lecture 6.4 18/20

And uniqueness result does not hold on unbounded domains. Consider the Dirichlet boundary value problem posed on the upper half plane Laplacian  $u$  is 0. And  $u$  is 0 for all  $x$  in  $\mathbb{R}$  so upper half plane boundary is the  $x$  axis. So, this BVP has at least 2 solutions  $u_1$  of  $x y = x y$ ,  $x y$  Laplacian will be 0. And when I put  $y = 0$ , this is 0 so it is a solution to this boundary

value problem. Of course, 0 is also a solution so we do not have uniqueness for Dirichlet boundary value problem on unbounded domains in general.

**(Refer Slide Time: 18:50)**

The image shows a video lecture window. The main content is a slide titled "Summary" with two bullet points:

- 1 Weak maximum principle was proved.
- 2 We deduced the continuous dependence on Boundary data for Dirichlet BVP from the Weak maximum principle.

The slide footer contains the text: S. Shivaj Ganesh (IIT Bombay) Partial Differential Equations Lecture 6.4 19 / 20. A small video inset in the top right corner shows the lecturer, a man in a maroon shirt, against a colorful background.

Summary weak maximum principle was proved we deduced continuous dependence on boundary data for Dirichlet boundary value problem from the weak maximum principle. Thank you.
