Applications of Stieltjes Transform, Generalized Stieltjes Transform Part - 02

Example 1) The example says find the solution find the solution of the integral find the solution of the integral equation given by:

$$\lambda \int_0^{\infty} \frac{f(t)dt}{t+x} = f(x) \quad \dots(1)$$

So, the solution consists of two cases. We see that if lambda assumes a particular value then we can right away solve using the definition of Stieltjes transform, but if not then we have to process the solution a bit further. So, let me just divide it into two cases.

Case 1).

$$\lambda \neq \frac{1}{\pi}$$

So, I am going to show that,

$$f(t) = At^{-\alpha} + Bt^{\alpha-1}$$

where α is the root of $\sin \alpha \pi = \lambda \pi$

Consider,

$$f = t^{-\alpha} \rightarrow (a)$$

Now Substitute equation (a) in equation (1),

$$\lambda \int_0^{\infty} \frac{t^{-\alpha} dt}{t+x} = \lambda \int_0^{\infty} \frac{t^{p-1} dt}{t+x}$$

where $p = 1 - \alpha$

$$= \lambda \pi x^{p-1} \operatorname{cosec}(\pi p)$$

$$= x^{-\alpha} \left(\frac{\lambda \pi}{\sin \pi \alpha} \right)$$

Now we see that if I choose my α such that I have,

$$\left(\frac{\lambda \pi}{\sin \pi \alpha} \right) = 1$$

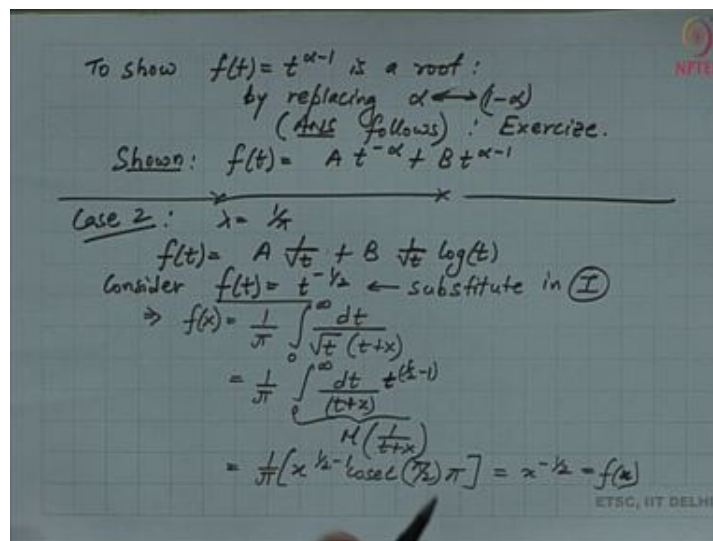

$$= x^{-\alpha} = f(x)$$

$f = t^{-\alpha}$: is the root of (1)

So, what I want to highlight is to show that if to show that the other function given by $t^{\alpha-1}$ is a root I have the following I have that. I can easily show that this function is also the root by replacing my α by $1 - \alpha$ in the previous expression of my steps. So, when I do that I can so, the answer will follow right away. So, I leave this as an exercise to the students to see that, if I replace my α by $1 - \alpha$ then I also get that $f(t)$ given by this $t^{\alpha-1}$ is another root.

So, that completes the first case. So, I have shown that :

$$f(t) = At^{-\alpha} + Bt^{\alpha-1}$$

So, moving on let us look at another case, Case 2).

$$\lambda = \frac{1}{\pi}$$

$$f(t) = A \frac{1}{\sqrt{t}} + B \frac{1}{\sqrt{t}} \log(t)$$

Consider, $f(t) = t^{-1/2}$

Substitute in Equation(1),

$$\begin{aligned} f(x) &= \frac{1}{\pi} \int_0^\infty \frac{dt}{\sqrt{t}(t+x)} \\ &= \frac{1}{\pi} \int_0^\infty \frac{dt}{(t+x)} t^{(\frac{1}{2}-1)} \\ &= \frac{1}{\pi} \left[x^{\frac{1}{2}-1} - \operatorname{cosec}\left(\frac{\pi}{2}\right)\pi \right] \\ &= x^{-1/2} = f(x) \end{aligned}$$

Let $f(t) = \frac{1}{\sqrt{t}} \log(t)$ in (I):

$$\begin{aligned} f(x) &= \frac{1}{\pi} \int_0^\infty \frac{\log(t)}{\sqrt{t}(t+x)} dt \\ &= \frac{1}{\pi} \int_0^\infty \frac{u e^u du}{e^{u/2}(x+e^u)} \quad \begin{cases} u = \log(t) \\ du = \frac{1}{t} dt \\ t du = dt \\ e^u du = dt \end{cases} \\ &= \frac{1}{\pi} \int_0^\infty \frac{u e^{u/2} du}{x+e^u} \end{aligned}$$

① Replace $x \leftrightarrow e^x$

② Multiply both sides by $e^{x/2}$: $\Rightarrow e^{x/2} f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \frac{u e^{\frac{x+u}{2}} du}{(e^x + e^u)}$

Choose $t = x - u$

$$\begin{aligned} &= \frac{1}{2\pi} \int_{-\infty}^{\infty} u \operatorname{sech}\left(\frac{x-u}{2}\right) du \\ &= \frac{1}{2\pi} \int_{-\infty}^{\infty} (x-t) \operatorname{sech}\left(\frac{t}{2}\right) dt \end{aligned}$$

Let $f(t) = \frac{1}{\sqrt{t}} \log(t)$... in (1)

$$\begin{aligned} f(x) &= \frac{1}{\pi} \int_0^\infty \frac{\log(t)}{\sqrt{t}(t+x)} dt \\ &= \frac{1}{\pi} \int_0^\infty \frac{u e^u du}{e^{u/2}(x+e^u)} \\ &= \frac{1}{\pi} \int_0^\infty \frac{u e^{\frac{u}{2}} du}{x+e^u} \end{aligned}$$

Where,

$$\begin{aligned} u &= \log(t) \\ du &= \frac{1}{t} dt \\ t du &= dt \\ e^u du &= dt \end{aligned}$$

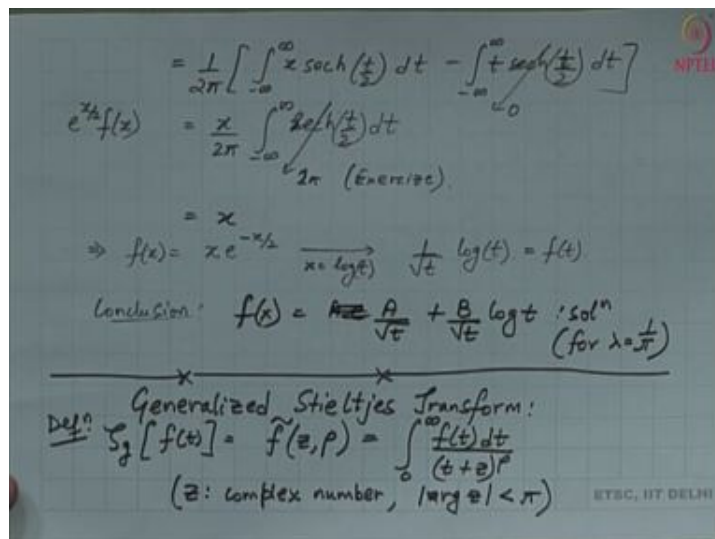

So, these are the steps I will follow. So, first is I am replacing in this expression given here I am replacing x by e^x , and I am also multiplying both sides by $e^{\frac{x}{2}}$.

$$e^{x/2} f(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \frac{ue^{\frac{x+u}{2}} du}{(e^x + e^u)}$$

$$= \frac{1}{2\pi} \int_{-\infty}^{\infty} u \operatorname{sech} \left(\frac{x-u}{2} \right) du$$

choose $t = x - u$,

$$= \frac{1}{2\pi} \int_{-\infty}^{\infty} (x-t) \operatorname{sech} \left(\frac{t}{2} \right) dt$$

$$= \frac{1}{2\pi} \left[\int_{-\infty}^{\infty} x \operatorname{sech} \left(\frac{t}{2} \right) dt - \int_{-\infty}^{\infty} t \operatorname{sech} \left(\frac{t}{2} \right) dt \right]$$

$$e^{x/2} f(x) = \frac{x}{2\pi} \int_{-\infty}^{\infty} \operatorname{sech} \left(\frac{t}{2} \right) dt$$

$$= x$$

$$f(x) = x e^{-x/2} \rightarrow \frac{1}{\sqrt{t}} \log(t) = f(t)$$

$$\text{Conclusion, } f(x) = \frac{A}{\sqrt{t}} + \frac{B}{\sqrt{t}} \log t$$

So, so far I have already discussed Hilbert transform and then the specific case of Hilbert transform and now I am going to generalize my results for Stieltjes transform and look at the generalized transform ok. So, let me just define the generalized Stieltjes transform it is defined as,

Definition:

$$\mathcal{S}_g[f(t)] = \tilde{f}(z, \rho) = \int_0^\infty \frac{f(t)dt}{(t+z)^\rho}$$

in this definition I have assumed that z is a complex number I have assumed that z is a complex number and such that my argument of this number is less than π . So, I need all the principle values of the well I need to make sure that the function is well defined that is hence this particular limitation. So, let us look at some examples.
