Lecture - 14
Examples of basis and standard basis of a vector space

Hello viewers. Welcome back to the course on Matrix Computation and its application. So, in the previous lecture, we have discussed about the basis and the dimension of a vector space and in this lecture, we will continue with that one. So, let us start with this. So, this is lecture number 14.

(Refer Slide Time: 00:52)

$S = \{v_1, v_2, \dots, v_n\}$ $[S] = V$, then any subset of V can't have more than n number of L.I. vectors.

Corollary: If V has a basis of n -elements, then every set of p -vectors with $p > n$ is L.D.

Corollary: If V has a basis of n -elements, then every other basis of V also has n -elements.

Proof: Let's take $B_1 = \{v_1, v_2, \dots, v_n\}$ and $B_2 = \{w_1, w_2, \dots, w_m\}$ are the two bases of vector space V i.e. $[B_1] = V$ & $[B_2] = V$.

(i) Since $[B_1] = V$ and $B_2 = \{w_1, w_2, \dots, w_m\}$ is L.I.
 Then use previous theorem $\Rightarrow m \leq n$

(ii) Similarly $[B_2] = V$ $B_1 = \{v_1, v_2, \dots, v_n\}$ is L.I.
 $\Rightarrow n \leq m$

from (i) & (ii) $\Rightarrow \boxed{m = n}$.

Now; so, in the previous one, we have discussed that if I have a set S which contains n number of elements and that S spans the whole vector space V . Then then any subset of V can, then any subset of V cannot have more than n number of n ; more n numbers of linearly independent vectors. So, that we have seen.

Now, there is a corollary. So, in this corollary; it says that if V has a basis; if the V has a basis of n -elements, then every set of P -vectors with P greater than n is linearly dependent. So, that we already we also seen using the one example, because the V has a basis which contains

n-elements; it means, that V is n -dimensional and then every set of P -vectors with P greater than n is L-D. So, that we have already seen also.

Now, after this one we can have some another corollary. If the vector space V has a basis of n -elements, then every other basis of V also has n -elements; it means, if one basis has n -elements then, if I choose any other basis that also contain n -element.

So, the proof is. So, let us take basis B_1 . Suppose, that contains v_1, v_2 up to v_n . And I take B_1 and B_2 that contains w_1, w_2 up to w_m . So, let take B_1 and B_2 are the two bases of vector space v ; that is, B_1 spans V and B_2 also spans v .

Now, we have to show that n is equal to m . Now, since B_1 spans v and B_2 is w_1, w_2 up to w_m is L-I then, using previous theorem. We have that m will be less than equal to n , in the previous theorem we have discussed. So, this is the 1st one, 2nd one. Similarly, B_2 spans v , because it is a basis. So, if it is basis definitely span.

And B_1 that is containing v_1, v_2 up to v_n elements is L-I. So, it spans V and this set is L-I which implies that V which implies that n definitely will be less than m . So, from these two condition. So, from 1 and 2 we get m is equal to n . So, if I choose any two basis then, they will contain that the set will contain the same number of elements in that basis. So, this is the proof we have done now.

Standard basis:- $V_n(\mathbb{R})$ vector space

$$V_n = \{(x_1, x_2, \dots, x_n) \mid x_i \in \mathbb{R}\}$$

Standard basis

$$e_1 = (1, 0, \dots, 0) \in V_n$$

$$e_2 = (0, 1, \dots, 0)$$

$$\vdots$$

$$e_n = (0, 0, \dots, 1) \in V_n$$

Now, we can check

(i) $\{e_1, e_2, \dots, e_n\}$ is L.I. $\left[\begin{matrix} 1 & 0 & \dots & 0 \\ 0 & 1 & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & 1 \end{matrix} \right] \rightarrow$ identity matrix

\Rightarrow

(ii) $\{e_1, e_2, \dots, e_n\}$ spans V_n .

Let us take a vector $(x_1, x_2, \dots, x_n) \in V_n$

$$(x_1, x_2, \dots, x_n) = x_1(1, 0, \dots, 0) + x_2(0, 1, \dots, 0) + x_3(0, 0, 1, \dots) + \dots + x_n(0, 0, \dots, 1)$$

$$= x_1 e_1 + x_2 e_2 + \dots + x_n e_n$$

$\Rightarrow \{e_1, e_2, \dots, e_n\}$ is a basis of V_n . \rightarrow using

So, after this one we can discuss about the standard basis. So, standard basis we can discuss like we have a V_n ; V_n is a vector space and V_n contains all the elements like this $1 \times 2 \times 1 \times 2$ up to x_n such that each x_i belongs to real line.

So, this is vector space over the real line that we already know this one. Now, and in this case, we can define the standard basis. The first basis I can define as e_1 that is I can write 1 here and 0 0 0, another I can define the vector 0 1 0 0 so on and in the last I can define e_n that contain 0 0 0 1. So, this all belongs to V_n .

Now, how they are the standard basis. Now, we can check the set $e_1 e_2$ up to e_n . So, this is the set is L-I. So, why it is L-I? Because the corresponding matrix will get 0 1 0 0 0 up to 1. So, you will get only unit matrix or identity matrix. So, we call it and this is always invertible. So, in this case this matrix identity matrix, so which implies that the set of vectors are linearly independent. So, the 1st claim is over. The 2nd one is that the set e_1, e_2 up to e_n spans V_n .

So, that is very easily we can show that let we take a vector say $x_1 \times 2$ up to x_n belongs to V_n . So, this case I can write $x_1 \times 2$ to x_n ; this can be written very easily like $x_1, 1 \ 0 \ 0$ plus; $x_2, 0 \ 1 \ 0$ up to 0; $x_3, 0 \ 0 \ 1$ and $x_n \ 0 \ 0$ up to. And I maybe, I can write $x_1 e_1$ plus $x_2 e_2$ up to $x_n e_n$.

e_n . So, this vector can be written like this one and this is unique. So, we can write this uniquely.

So, from here, I can say that it is linearly independent and it spans V_n . So, from here I can say that the set $\{e_1, e_2, \dots, e_n\}$ is a basis of V and we call it standard basis, because it contains only one non-zero element and all other elements 0. So, that we can always use if somebody ask about some basis of any vector space, then we can the simplest basis we can have with the standard basis.

(Refer Slide Time: 12:01)

$P_n(x)$ $x \in I$ $P_n(x)$ = set of all polynomial with degree $\leq n$. $x \in I$
Standard basis
 $P(x) = a_0 + a_1x + a_2x^2 + \dots + a_nx^n$ → Contains $(n+1)$ no. of coefficients
 $a_0 + a_1x + \dots + a_nx^n = a_0 + a_1(x) + a_2(x^2) + a_3(x^3) + \dots + a_n(x^n)$
 $\Rightarrow B = \{1, x, x^2, \dots, x^n\} \in P_n(x)$
↓ → standard basis for the vector space $P_n(x)$.
(n+1) elements
 $\Rightarrow P_n(x)$ is a $(n+1)$ dimensional vector space.
 # Finite-dimensional vector spaces → whose basis contains finite no. of elements.
Infinite-dim vector spaces → whose basis contains infinite no. of elements.
 for example $C[-\infty, \infty]$, $C[a, b]$

Now. So, after discussing this one, what about the vector space $P_n(x)$ where x belongs to some interval I . So, we know that $P_n(x)$ is set of all polynomials with degree less than equal to n and x is coming from the interval.

So, we know that it is a vector space. So, in this vector space, the standard basis. Now, if I take the element any element from here. So, let me choose, let me write a 0 plus a 1 x plus a 2 x square up to a $n \times n$. So, this is the polynomial I have from here. So, that it is I call it $P_n(x)$. So, in this $P_n(x)$ you know that it contains $n + 1$ number of co-efficient.

So, this I can write as $a_0 + a_1x + a_2x^2 + \dots + a_nx^n$. So, this I can write as a_0 plus a_1x plus a_2x^2 plus a_3x^3 plus a_nx^n . So, from here, you

can say that if I choose any vector from here, then I just take a set containing the element $1 \times x^2 \times x^3 \times \dots \times x^n$.

So, this is a set I call it maybe, I call it B . So, this is the set that belongs to $P_n(x)$, because 1 also belongs to $P_n(x)$ and x is also belongs to $P_n(x)$. And if I take any element from this $P_n(x)$, it can be written as a linear combination of these vectors and this is the simplest one.

So, from here, I can say that this is the standard basis for the vector space $P_n(x)$ and from here. And this vector contains $n + 1$ number of elements. So, from here, I can say that $P_n(x)$ is a $n + 1$ dimensional space. So, it is $n + 1$ dimensional vector space.

Now, from here, we can define now, from I can define the terminology finite dimensional spaces; finite dimensional vector spaces where. So, these are the those whose basis contains finite number of elements like we have seen V_n point $P_n(x)$ like this one.

And another is infinite dimensional, where basis contains infinite number of elements. For example, if I take the vector space of all the continuous function defined from minus infinity to infinity or I take the space C^1 defined from a to b . So, set of all the continuously differentiable function whose derivative is also differentiable or whose derivative is also continuous and defined from a to b .

So, this is $C^1(a, b)$, this is C^1 minus infinity to infinity. So, all these functions make the vector space and this is infinity dimension, because they cannot be represented by finite number of elements from that set. So, these are called the infinity dimensional spaces.

(Refer Slide Time: 18:48)

Thm In a n -dimensional vector space V , any set of n L.I vectors is a basis.

$\Rightarrow V_n \rightarrow n$ -dimensional. $S = \{v_1, v_2, \dots, v_n\}$ is L.I $\Rightarrow S$ is a basis of V_n

Thm In a vector space V , let $B = \{v_1, v_2, \dots, v_n\}$ spans V . Then the following two conditions are equivalent:

(i) $\{v_1, v_2, \dots, v_n\}$ is L.I ✓
(ii) if $v \in V$, then the expression $v = a_1 v_1 + a_2 v_2 + \dots + a_n v_n$ is unique.
 (a_1, a_2, \dots, a_n) is unique

Ex $S = \{x-1, x^2-x-1, x^2-x+1\}$ $V = P_2$
Check S is a basis?

Sol (i) we need to check S is L.I
 $a(x-1) + b(x^2-x-1) + c(x^2-x+1) = 0$ \rightarrow see polynomial
for all $x \in I$
 \Rightarrow Coeff should be same for LHS and RHS polynomial
 \rightarrow

8

Now, from here there is a one more result that in a n -dimensional vector space V , any set of n linearly independent vectors; linearly independent vectors is a basis, because if it is n -dimensional vector space, then you take any set which contains n linearly independent vectors and that vector, that set will be a basis for that vector space V . So, this is we can see very easily; it means that which implies that suppose, I take n elements n set. So, this is n -dimensional.

So, if I take a set as which contains n number of elements v_1, v_2 to v_n and this set is linearly independent, then I can say that S is a basis of V_n . So, if it is linearly independent, then it will definitely it will span the whole vector space V_n . So, that is why we call it that it is also a basis of this one.

So, once they are linear independent that is enough that this spans the whole V_n , because it is a n dimensional space. So, this is just the application of the previous theorems based on this vector spaces the dimension and the basis. So, it is understood we have also given lot of example based on this one.

Now, after this one, one more terminology we want to use is that theorem that in a vector space V . Let I take a basis B spans V then the. So, I just write a set B which spans V . I do not

know what is whether it is a basis or not. Then, the following two conditions are equivalent. The 1st one is the set v_1, v_2, \dots, v_n is linearly independent.

So, it spans V that is ok. Then, I can say that v_1, v_2, \dots, v_n is L-I or I can say that if I take any element v from V then, the expression v is equal to $\alpha_1 v_1 + \alpha_2 v_2 + \dots + \alpha_n v_n$ is unique; it means, that if I write this expression then this $\alpha_1, \alpha_2, \dots, \alpha_n$ all are unique. Only one representation is there that we can write V as a linear combination of v_1, v_2, \dots, v_n .

So, this is unique or maybe, I can say that $\alpha_1, \alpha_2, \dots, \alpha_n$ are unique. So, either it is L-I or it is unique both things are same. If it is L-I, then it is unique and if it is unique, then definitely it is L-I. So, just it can be seen very clearly, because it spans this one. So, if it is span, then any element from V can be written a linear combination of this one.

And if this is linearly independent also, then we have seen that the corresponding matrix we have seen that this is non-singular and we can have the unique solution.

So, in that case the representation will be unique and if the representation is unique, then this linearly independent. So, we can just understand from this one and it is up to the viewers to understand and to do the proof for this one. It is very simple. Now, after this one, let us do few examples based on this. So, let us write some question.

Suppose, I said that I have a set S . So, this is example let I take the set S which contains $x - 1$ and $x^2 + x - 1$ and suppose, my vector space V is P_2 ok. So, I want to check S is a basis or not. So, this one we have to check.

And now, I am taking the V as P_2 . So, P_2 means set of all the polynomials of degree less than equal to 2. So, this one I want to check. Now, 1st we need to check S is linearly independent.

So, for this one, what I am going to do is. I will take $a(x - 1) + b(x^2 + x - 1) = 0$; 0 means 0 polynomial, but here we. So, ok let us solve this one. Now, this is true for all x belongs to the interval. This expression is true for all x belongs to the interval.

Otherwise, if you put like this one, then maybe you can find the roots, but the condition here is that this is true for all x belongs to a .

So, if it is true for all x ; implies that the coefficient should be same for left-hand side and right-hand side polynomial. So, from here which implies that now, I can choose the terms corresponding to x square. So, it is b plus c .

(Refer Slide Time: 28:30)

Some facts:

(1) In a vector space V , if v is a linear combination of $v_1, v_2, v_3, \dots, v_n$ i.e.

$$\alpha_1 v_1 + \alpha_2 v_2 + \alpha_3 v_3 + \dots + \alpha_n v_n = v \text{ or } v \in [v_1, v_2, v_3, \dots, v_n], \text{ then } \{v, v_1, v_2, v_3, \dots, v_n\}$$

is LD.

9

(Refer Slide Time: 28:32)

Some facts:

(1) If a set is L I, then any subset of it is also L I. and

(2) If a set is LD, then any superset of it is also LD.

10

(Refer Slide Time: 28:34)

$$(b+c)x^2 + (a+b-c)x + (-a-b+c) = 0$$

$$\Rightarrow \begin{cases} b+c=0 \\ a+b-c=0 \\ -a-b+c=0 \end{cases} \Rightarrow a+b-c=0$$

$$\Rightarrow \begin{cases} b+c=0 \\ a+b-c=0 \\ a+b-c=0 \end{cases} \Rightarrow \begin{bmatrix} 0 & 1 & 1 \\ 1 & 1 & -1 \\ 1 & 1 & -1 \end{bmatrix} \begin{bmatrix} a \\ b \\ c \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

$AX=0$ and $\text{rank}(A) \leq 2$
 $\Rightarrow A$ is singular
 \Rightarrow the set S is L.D
 $\Rightarrow S$ is not a basis for \mathbb{R}^3 \square

11

Now, from here I can write $b + c x^2$; that is, I can find then with respect to x I can write $a + b - c x$ plus the constant term. So, I can write here, $-a - b + c$ equal to 0. So, this one I can write. From here, I can write $b + c$ is equal to 0, then $a + b - c$ equal to 0 and from here I can have $-a - b + c$ equal to 0.

Now, from here, this one I can write expression as $a + b - c$ equal to 0 and that is already there. It means this system is, because corresponding to x is $a + b - c$ and this is $-a - b + c$ and this is both are same. So, it means I have a system verification that is $b + c$ equal to 0, $a + b - c$ equal to 0 and $a + b - c$ equal to 0.

So, this one equation is a redundant equation. So, from here, I can say that this is the matrix with rank 2, because if I write the matrix correspond matrix. So, it is $\begin{bmatrix} 1 & 0 & 1 \\ 1 & 1 & -1 \\ 1 & 1 & -1 \end{bmatrix}$ $a \ b \ c$ equal to $0 \ 0 \ 0$ and from here you can check that this matrix cannot be.

So, $AX = 0$ and a rank of A in this case is always less than equal to 2 it cannot be 3. Because just I can reduce this last row as a 0 here, no problem and from here, I can say that A is singular and which implies that the set S is linearly dependent.

So, if it is a linearly dependent then, from here, I can say that the set S is not a basis for P_2 , because if it is not a L-I, then from here, we can say that this set is not going to be the basis for this one, because for the basis, it should be linearly independent and should span this one.

So, first condition is not satisfied from here only we can conclude that this S is not the basis for the set of polynomial of degree less than equal to 2 ok. So, from here. So, I think we can stop here. So, today we have discussed about the meaning of finite dimensional spaces and infinite dimensional spaces and discuss few examples. So, in the next lecture, we will continue with this one. So, thanks for watching.

Thanks very much.
