Matrix Computation and its applications Lecture - 22

NOTE! Suppose  $A_{m \times n}$  and  $\text{rank}(A_{m \times n}) = r$  and let  $P = \begin{pmatrix} p_1 \\ \vdots \\ p_n \end{pmatrix}$  be a non-singular matrix s.t.  $PA = U = \begin{pmatrix} C_{r \times n} \\ 0 \end{pmatrix}$ , where  $U$  is in row-echelon form, then

$R(A) = N(P)$   $N(A^T) = R(P^T)$

As we have done previous example,  $P_2 = (-2, 1, 0)$   $N(A) \Rightarrow AX=0$

$N(P_2) \Rightarrow (-2, 1, 0) \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = 0$   $A_{4 \times 5}: \mathbb{R}^5 \rightarrow \mathbb{R}^4$

$\Rightarrow -2x_1 + x_2 = 0 \quad \text{--- (1)}$   $x_3, x_4$  are free variables.

$\Rightarrow x_2 = 2x_1$

Hello viewers, welcome back to the course on Matrix Computation and its Application. So, in the previous lecture, we have discussed one example and show the dimensions of range space and null space. So, today we are going to continue with that one. So, let us do this one.

(Refer Slide Time: 00:57)

$N(A) = \{x \mid Ax = 0\}$   
 $x = \begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \end{pmatrix} = \begin{pmatrix} -2x_2 - \frac{5}{3}x_4 \\ x_2 \\ -\frac{2}{3}x_4 \\ x_4 \\ 0 \end{pmatrix} = x_2 \begin{pmatrix} -2 \\ 1 \\ 0 \\ 0 \\ 0 \end{pmatrix} + x_4 \begin{pmatrix} -5/3 \\ 0 \\ -2/3 \\ 1 \\ 0 \end{pmatrix}$

Nullity = 2      Rank(A) = 3

$N(AT) = R(B^T) = R \left( \begin{pmatrix} -2 \\ 1 \\ 0 \\ 0 \end{pmatrix} \right) = \begin{pmatrix} -2 \\ 1 \\ 0 \\ 0 \end{pmatrix} x$

$N(AT) = \begin{pmatrix} -2 \\ 1 \\ 0 \\ 0 \end{pmatrix}$       Also  $\dim(N(AT)) = 1$   
 $\dim(R(A)) = 3$

We Can Check      Rank + Nullity =  $\dim(R(AT)) + \dim N(A) = 5 = \dim$  of  $\mathbb{R}^5$   
 $\dim(R(A)) + \dim N(AT) = 3 + 1 = 4 = \dim$  of  $\mathbb{R}^4$

So, today I am going to discuss other properties of the corresponding system. So, if you remember that in the previous lecture, we have discussed one example and we showed the range of the given matrix.

(Refer Slide Time: 01:01)

Since Rank(A) = 3  $\neq$  no. of variables = 5  
 $\Rightarrow N(A) \neq \{0\}$

Also Rank(A) = 3  
 $\Rightarrow R(A), R(AT) \rightarrow \dim: 3$

$x_1 = -2x_2 - \frac{5}{3}x_4$

$R(A) = \left[ \begin{pmatrix} 1 \\ 2 \\ 3 \\ 1 \end{pmatrix}, \begin{pmatrix} 2 \\ 4 \\ 6 \\ 2 \end{pmatrix}, \begin{pmatrix} 1 \\ 2 \\ 4 \\ 1 \end{pmatrix} \right]$

$R(AT) = \text{Span by the rows of A Corresponding to non-zero rows of } U.$   
 $= \left[ (1, 2, 3, 1), (2, 4, 6, 2), (1, 2, 4, 1) \right]$

$N(A) = \{x \mid Ax = 0\} \Rightarrow \boxed{Ux = 0}$

$x_1 + 2x_2 + 3x_3 + x_4 = 0 \Rightarrow x_1 = -2x_2 - 3x_3 - x_4$   
 $2x_1 + 4x_2 + 6x_3 + 2x_4 = 0 \Rightarrow x_3 = -\frac{2}{3}x_4$   
 $2x_5 = 0 \Rightarrow \boxed{x_5 = 0}$

(Refer Slide Time: 01:07)

$$A = \begin{bmatrix} 1 & 2 & 2 & 3 & 1 \\ 2 & 4 & 4 & 6 & 2 \\ 3 & 6 & 6 & 9 & 6 \\ 1 & 2 & 4 & 5 & 3 \end{bmatrix}$$

$$A_{4 \times 5} : \mathbb{R}^5 \rightarrow \mathbb{R}^4$$

Also, we know that  $\text{rank}(A) \leq \min\{m, n\} = 4$

**Sol. Augmented matrix**  $[A|I] \Rightarrow \begin{bmatrix} 1 & 2 & 2 & 3 & 1 & 1 & 0 & 0 & 0 \\ 2 & 4 & 4 & 6 & 2 & 0 & 1 & 0 & 0 \\ 3 & 6 & 6 & 9 & 6 & 0 & 0 & 1 & 0 \\ 1 & 2 & 4 & 5 & 3 & 0 & 0 & 0 & 1 \end{bmatrix} \rightarrow U$

$$\begin{matrix} -2R_1 + R_2 \\ -3R_1 + R_3 \\ -R_1 + R_4 \end{matrix} \rightarrow \begin{bmatrix} 1 & 2 & 2 & 3 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & -2 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 3 & -3 & 0 & 1 & 0 \\ 0 & 0 & 2 & 2 & 2 & -1 & 0 & 0 & 1 \end{bmatrix} \xrightarrow{R_2 \leftrightarrow R_4} \begin{bmatrix} 1 & 2 & 2 & 3 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 2 & 2 & 2 & -1 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 3 & -3 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\text{rank}(A) = 3 < 5 \quad P = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -1 & 0 & 0 & 1 \\ -3 & 0 & 1 & 0 \\ -2 & 1 & 0 & 0 \end{bmatrix}$$

(Note: The matrix P is annotated with row operations:  $\times P_1$ ,  $\times P_2$ ,  $\times P_3$ ,  $\times P_4$ )

So, this was my matrix. And we have discussed the range space of a transpose. And then we have also shown that the P matrix the non non-singular matrix P. So, the row corresponding to the 0 rows in the echelon form, and then using this one we have showed this relation that range space of  $P_2^T$  is equal to the null space of  $A^T$ . So, the same thing we are going to discuss now.

So, it say that suppose we have a matrix A that is  $m \times n$ , and let the rank of  $A = r$ . And let we have a matrix P that is given by  $P_1$  and  $P_2$  as discussed in the previous lecture be a non-singular matrix such that  $PA=U$  that is the row echelon form. So, this will be definitely some matrix C that is  $r \times n$  and this will be 0 because the rank is r. So, this matrix is going to have only non-zero rows that are r in number, and n is the number of variables. So, this is there, where U is in row echelon form.

Then, so then we are going to have one relation, and this relation is that the range of A can be written as the null space of  $P_2$  this one, so where this is my  $P_2$ . Earlier we also discussed that  $N(A^T)$  that is a range space of  $P_2^T$ . So, this is what we have discussed in the previous lecture.

Now, I want to discuss this one. So, as we have done previous examples, so from there I will, so this one already we know. So,  $P_2$ , I am just going to get what the  $P_2$  is there. So, basically

if you see, then my  $P_2 = \{-2, 1, 0, 0\}$ , so that is my  $P_2$ . My  $P_2$  is basically this row  $\{-2, 1, 0, 0\}$ .

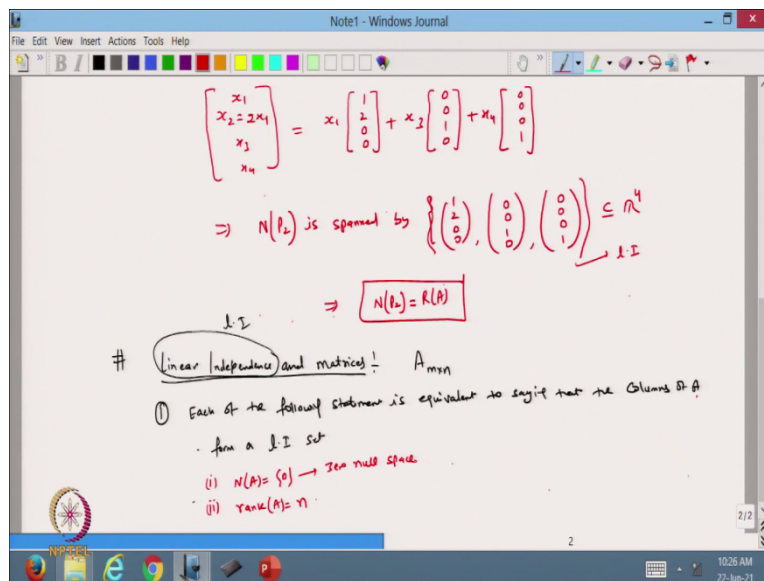

So, this is my row vector. Now, I want to find what will be the null space of  $P_2$ . So, basically we are going to write  $P_2$  that is  $\{-2, 1, 0, 0\}$ . So, it is a row vector that is basically  $1 \times 4$ , and then I will apply. So, this will give me this into I am applying over the element 4. So, I am suppose I am taking it as  $x_1, x_2, x_3, x_4$  so it is basically  $4 \times 1$ .

And then it should be equal to 0 because whenever we are going to deal with  $N(A)$ , it means we are going to deal with this system. So, I am going to deal with the null space of  $P_2$  implies that  $P_2$  this is our matrix that of dimension  $1 \times 4$  with this where the number of variables, and that is equal to 0.

So, from here I can write this one as  $-2x_1 + x_2 = 0$ . So, I am getting only one equation from here. So, this one we have done, only one equation is there. And my matrix was from  $\mathbb{R}^5$  to  $\mathbb{R}^4$ . So, that also we have to keep in mind that our matrix was  $4 \times 5$  so moving from  $\mathbb{R}^5$  to  $\mathbb{R}^4$ . Now, this is our equation. Now, from here you can see that  $x_3$  and  $x_4$  are basically free variables because they are multiplied by 0. So, from here I can say that this is the equation number 1, and  $x_3, x_4$  are free variables.

So, from here on out, I can write down. So, now, from the previous matrix, we came to know that the rank of  $A$  is 3. So, the range of  $A$  is this one. So, it is made up of this one. So, this one we are going to do now. So, from here, I can say that my  $x_1$  or maybe my  $x_2$  can be written as  $2x_1$ . So, this relation I can write  $x_2$  is becoming equal to this one.

(Refer Slide Time: 08:11)

So, from here I can write that my  $x_2$  is equal to  $2x_1$ , and  $x_1$  is always there, and  $x_3, x_4$ . So, this is my vector I am going to have. So, that vector can be written as because this vector is basically I need to find the values of  $x_1, x_2, x_3, x_4$ . So,  $x_1, x_2, x_3, x_4$  can be written like this way.

So, from here, I can write that I can take the  $x_1$  common. So, it will give me  $x_1(1, 2, 0, 0) + x_3(0, 0, 1, 0) + x_4(0, 0, 0, 1)$ . It means that the null space of  $P_2$  is spanned by this set of vectors  $\{1, 2, 0, 0\}, \{0, 0, 1, 0\}$ , and  $\{0, 0, 0, 1\}$ . And you can check that this set is linearly independent and is. So, this will be the subspace. So, it belongs to the set  $\mathbb{R}^4$ . And this will be.

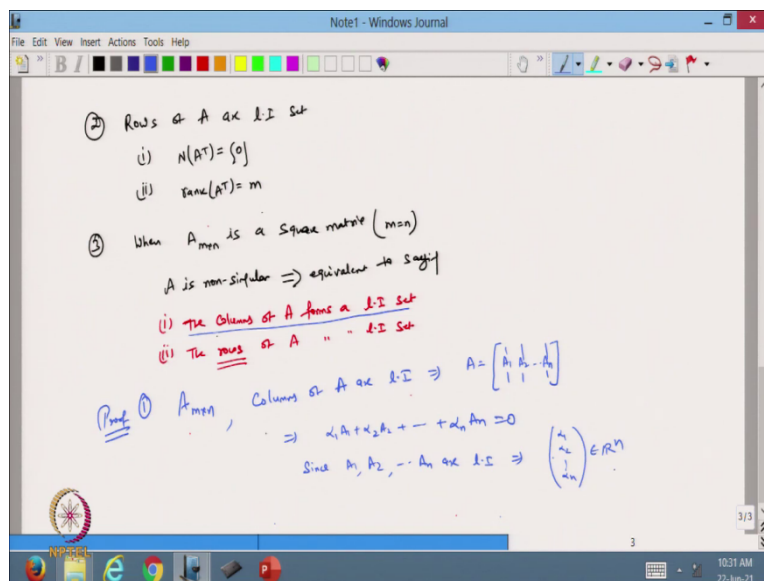

So, now, if you see from here that in this case my range space of  $A$  is spanned by the element  $\{1, 2, 3, 1\}, \{2, 4, 6, 4\}$ , and  $\{1, 2, 6, 3\}$ , but there are three number of vectors are there, and they are linearly independent. The same thing is coming here. Only the thing is that we have the same number of vectors, but these vectors are not the same as the we have got in that range space of  $A$ .

But so in this case we can say that the basis vectors have been changed but the dimension is the same. So, from here you can check. So, from here you can imply that the null space of  $P_2$  is always equal to, so this can be written as the range space of  $A$ . So, this one we have done. So, this one this way we can write down these things.

So, after doing this one, now we are going to start with some other things like linear independence and matrices. So, suppose we have a matrix  $A$  that is  $m \times n$  matrix. Now, first one that each of each of the following statements is equivalent to saying that the column of  $A$  forms a linearly independent, so this word can be written as II. So, a linearly independent set if the null space of  $A$  contains only 0 element.

So, which of the following statements is equivalent to saying that the columns of  $A$  form a linearly independent set? So, because in this case we have a matrix  $A$  is  $m \times n$ , so I know that it is going to have  $n$  number of columns and  $m$  number of rows. So, the columns of  $A$  forms a linearly independent set, it is equivalent to saying that the null space of  $A$  is 0, and the rank of  $A$  is going to be equal to  $n$  the number of variables. So, this is a 0 null space.

(Refer Slide Time: 13:29)

Second one. Now, I can talk about rows of  $A$  being a linearly independent set, it is equivalent to saying that null space of  $A^T$  is just the 0 element. And the second one is that the rank of  $A^T$  is equal to  $m$ ; and  $m$  is the number of rows in that given matrix. So, now the third case is that what will happen when the matrix  $A$  is  $m \times n$  is a square matrix. Square matrix is when  $m = n$ .

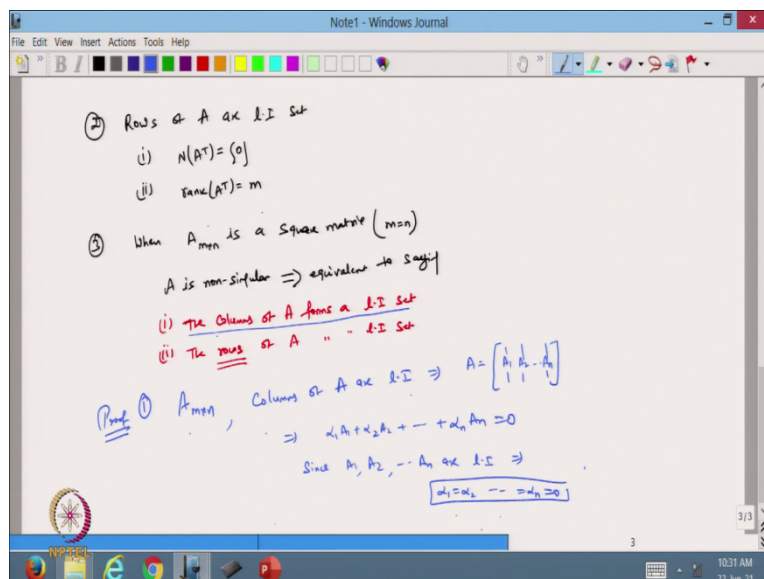

Then  $A$  is non-singular, so that is equivalent to saying, so this is equivalent to saying, the first one is that the columns of  $A$ , the columns of  $A$  form a linearly independent set. So, all the

columns of A are linearly independent to each other. And the second one is that the rows of A form a linearly independent set. It means that the rows of the matrix are also linearly independent to each other. So, these things we have to keep in mind.

Now, using this one, it is very clear. So, I can discuss the proof. Now, columns of A form the linear independent set, and the rows of A form the linear independent sets. So, we can say that suppose I have the matrix A that is  $m \times n$  matrix. Now, I am saying that the columns of A are linearly independent. So, this one I am first, I am doing this one saying that the columns of A are linearly independent. That is equivalent to saying that the null space contains 0 or the rank is equal to n. So, this is the proof for the first one.

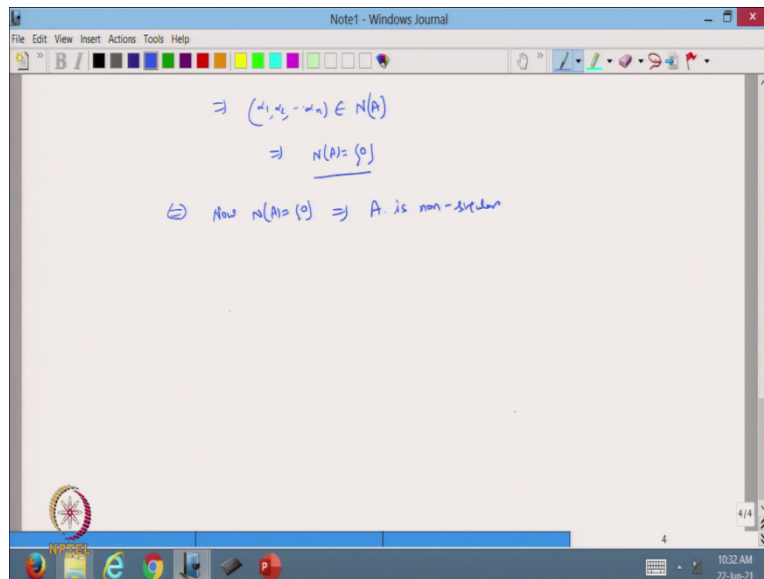

So, I am saying that the columns of A are linearly independent which implies that, so I have a matrix and that matrix is basically it has the column, so that column I can write as  $A_1, A_2, \dots, A_n$ , n is the number of columns. And these are linearly independent. So, this are linearly independent means that if I take the linear combination  $\alpha_1 A_1 + \alpha_2 A_2 + \dots + \alpha_n A_n = 0$ . So, it is there. Then  $A_1, A_2, \dots, A_n$ , are l I which implies that the set  $\alpha_1, \alpha_2, \dots, \alpha_n$  that belongs to  $R^n$ , belongs to so this belongs to  $R^n$ . So, it is going to be that. So, if it is a linearly independent, then I can write even that  $\alpha_1, \alpha_2, \dots, \alpha_n$ , all are 0.

(Refer Slide Time: 18:03)

So, if all are 0, then from here.

(Refer Slide Time: 18:14)

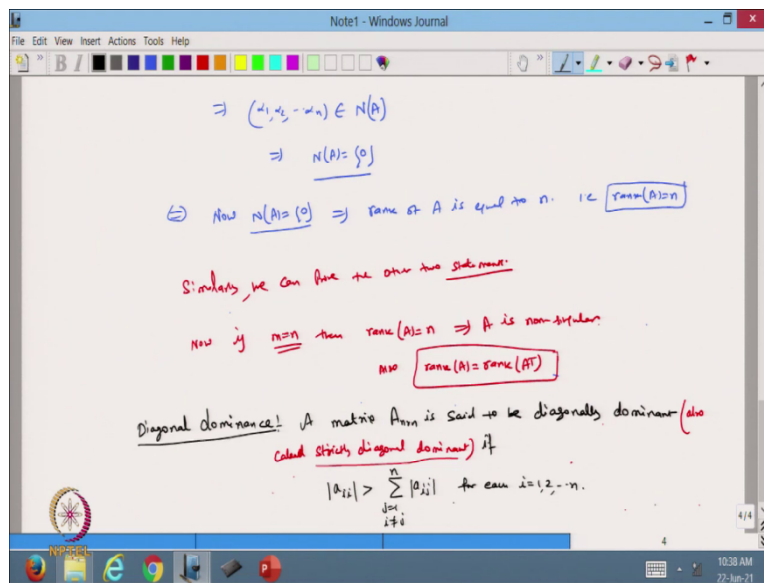

Which implies that the set  $\alpha_1, \alpha_2, \dots, \alpha_n$  belongs to null space of A. But in this case, all the vectors are linearly independent and showed that this  $\alpha$  is 0. So, from here I can say that null space of A will be only 0 element because all the  $\alpha$  is 0. We are able to show this one that the null space will contain only 0 elements.

And now from here you can say that this is equivalent to saying that the matrix. So, now the null space of A contains only 0 element which implies that the matrix A is non-singular. If it is now these things I can say only when it is a square matrix.

(Refer Slide Time: 19:34)

So, from here I can write that from here I can say that the rank of matrix  $A = n$ , so that I can say because null space contains only 0 element. So, I can say that the rank of the matrix will be  $n$ . So, the rank of  $A$  is  $n$  because if it is a square matrix then I know that the rank of the matrix  $A$  will be  $n$ , and then it will be non-singular. So, this is the same thing we can write down.

So, similarly we can prove the other two. So, these are the other two properties that we have or the statements, so other two statements because in that case we have to deal with only rows. So, the rows of  $A$  are linearly independent. Then the same way we can write down that the null space of  $A^T$  will be 0 and the rank will be equal to the number of rows.

And if it is a square matrix, then we can say because if  $m$  is equal to  $n$ , now if  $m$  is equal to  $n$ , then rank of  $A$  is equal to  $n$  which implies that matrix  $A$  is non-singular. Also the rank of  $A$  is equal to the rank of  $A^T$ , so that we already know because we take the matrix  $A$  to find the rank, then you just take the transpose of that matrix and then again find the rank that will be the same. So, we already know the rank of the matrix and its transpose are always the same. So, these things we are using this one.

Now, so I want to use this statements for solving some real applications that if the null space contains only zero element, then this is true that the given columns are linearly

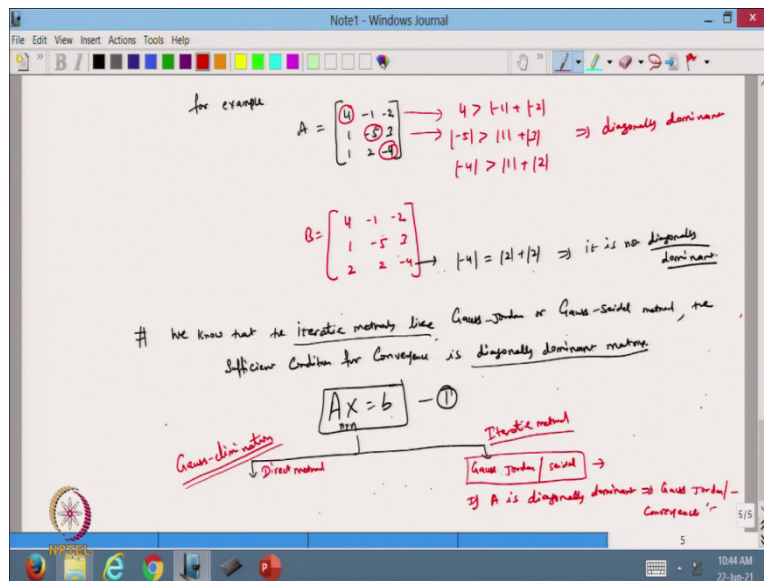

independent or the corresponding rows are linearly independent; or if the matrix is a square matrix, then it is it will be non-singular. So, these things we are going to use for discussing some important things.

So, the first thing we are going to discuss is a very important topic and that is called diagonal dominance. So, a matrix A so that is of order  $n \times n$ , so I am talking about the square matrix, which is said to be diagonal dominant or in some books sometimes it is also written as also called strictly diagonal dominant, in some books it is written as a strictly diagonally dominant. xc

So, matrix A is said to be diagonal dominant if I take the elements at the main diagonal

taking the modulus value. So, if  $|a_{ii}| > \sum_{j=1, j \neq i}^n |a_{ij}|$ ; for  $i=1,2,\dots,n$  and  $i \neq j$ .

(Refer Slide Time: 24:45)

So, this is called the diagonal dominant matrix for example, suppose I take the matrix A that is I may take  $3 \times 3$ . So, in this case, suppose I write here  $\{4, -1, -2\}, \{1, -5, 3\}, \{1, 2, -4\}$  and this is supposed to be  $-4$ . So, in this case, if you see, then these are my diagonal elements. And from here I can say that the  $|4| > |-1| + |-2|$ , so that is in the first row I am talking about.

And in the second row we are writing diagonal elements. So,  $|-5| > |1| + |3|$  ; and similarly  $|-4| > |1| + |2|$ . So, everywhere it is coming. So, it is called a diagonal dominant matrix.

But suppose I take another matrix B, and if I write the  $\{4, -1, -2\}$ ,  $\{1, -5, 3\}$ ,  $\{2, 2, -4\}$ . So, in this case, if you see that starting from here, then in this case  $|-4| = |2| + |-2|$ . So, in this case, we are going to have only equality signs. So, this sign is not there. So, in this case, we say that it is not diagonally dominant. So, these types of matrices are playing a vital role in numerical analysis or for the convergence of some numerical methods or iterative methods.

So, based on this I want to show, now, we know that with the iterative methods like Gauss-Jordan or Gauss-Seidel methods the sufficient condition for convergence is diagonal dominant matrix. So, with iterative methods like Gauss-Jordan or Gauss-Seidel, we know that the sufficient condition for convergence is that the matrix should be diagonal dominant. It means we have a matrix  $AX = b$ . So, this is a system of equations. And this is suppose  $n \times n$ .

So, I know that this type of system can be solved with the help of, for example, I assume we have done Gauss elimination. So, in the Gauss elimination, if you see we use the pivot pivoting, so pivoting is basically to have the largest element at the diagonal places. So, this type of thing is also related with the diagonal dominant matrix, and others are iterative methods. So, this is a direct method basically, and another is the iterative method. So, the iterative method is like Gauss-Jordan or Seidel.

So, this type of method is if we apply we are not sure that we are going to have the solution or not, but in this case we are going to get the solution if the matrix is diagonal dominant. So, that means, that, that is called the sufficient condition that if the matrix is diagonal dominant. So, if A is diagonal dominant, if A is diagonal dominant which implies that Gauss-Jordan or Seidel are convergent. But the converse is not always true. If the methods are converging that also does not mean that the matrix should be diagonal dominant.

But if the matrix is diagonal dominant, then definitely it is going to converge. So, these types of things are very important to deal with the iterative processes for solving the system of equations. So, those things are what we are going to discuss in the next lecture. So, let me stop here.

So, in the today lecture, we have discussed about one another properties of the that is related with the matrices that if the null space of the matrix corresponding matrix is only the zero space, then we can have that the given matrix is going to have the columns are going to be linearly independent, or the rows are going to be linearly independent. And then we have also discussed another definition of diagonal dominant matrix. So, we will use this one to show some properties in the next lecture.

So, thanks for watching. Thanks very much.
