**Calculus Of Variations and Integral Equation**

Welcome viewers, once again to the lecture series under NPTEL program on Integral Equation. In today's lecture, we are going to discuss about Hilbert Smith theory and its consequences such that, we can solve the non homogeneous Fredholm integral equations of second kind, by using the orthogonal functions associated with the corresponding homogeneous Fredholm integral equation. So, we are actually going to discuss the Hilbert Smith theorem and this related results will be used to solve the or find the solution of the Fredholm integral equation with symmetric kernel, this is very much important.

So, Hilbert Smith theory, in this lecture, we are surely concentrated on the property of the kernel, that kernel should be symmetric. So, before going to state the Hilbert Smith theorem, I am not going to prove the result, but before going to state the theorem, we need some relevant results related with the eigen values and eigen functions for the given problem.

(Refer Slide Time: 01:48)

$\{\lambda_n\} \rightarrow$  eigenvalues  
 $\{y_n(x)\} \rightarrow$  eigenfunctions  
$$y(x) = \lambda \int_a^b K(x,s) y(s) ds \dots (i)$$
  
where  $K(x,s) = K(s,x)$

1. The eigenvalues of (i) with symmetric kernel are real.
2. If  $y_m(x)$  and  $y_n(x)$  are eigenfunctions corresponding to two distinct eigenvalues  $\lambda_m$  and  $\lambda_n$  then  $y_m(x)$  and  $y_n(x)$  are orthogonal to each other.  
$$\int_a^b y_m(x) y_n(x) dx = 0$$
  
 $\lambda_m \neq \lambda_n$

So, first of all we consider that  $\lambda_n$  is the eigen values, these are eigen values and  $y_n(x)$  denotes the associated eigen functions, these are eigen functions and these eigen values are eigen functions are associated with the integral equation  $y(x) = \lambda \int_a^b K(x,s) y(s) ds$ , we call this particular equation as number 1, so this is a Fredholm integral equation, which is a homogeneous Fredholm integral equation. And the kernel  $K(x,s)$  is symmetric that means, it satisfies the property  $K(x,s) = K(s,x)$ , now we state certain results related with this eigen values and eigen functions.

First of all the eigen values of 1 that means, this integral equation with symmetric kernel are real, so that means, if we consider this Fredholm integral equation  $y(x) = \lambda \int_a^b K(x,s) y(s) ds$ , where this kernel  $K(x,s)$  which is symmetric, then all eigen values of this particular problem will be real.

Second property, if  $y_m(x)$  and  $y_n(x)$  are eigen functions corresponding to two distinct eigen values **corresponding to two distinct eigen values**  $\lambda_m$  and  $\lambda_n$ , then  $y_m(x)$  and  $y_n(x)$  are orthogonal to each other that means,  $\int_a^b y_m(x) y_n(x) dx = 0$ , this is equal to 0, where  $\lambda_m \neq \lambda_n$ . So that means, if we consider two eigen functions  $y_m(x)$  and  $y_n(x)$  corresponding to two distinct eigen values  $\lambda_m$  and  $\lambda_n$ , then  $\int_a^b y_m(x) y_n(x) dx = 0$ , implying they are orthogonal to each other.

(Refer Slide Time: 05:48)

3. The multiplicity 'm' of a non-zero eigenvalue is finite for every symmetric kernel, where the kernel  $K(x,s)$  is square integrable on  $[a,b] \times [a,b]$ .

$$K(x,s) = \sum_{n=1}^{\infty} \gamma_n y_n(x)$$

where,  $\gamma_n = \frac{\int_a^b K(x,s) y_n(x) dx}{\int_a^b y_n^2(x) dx}$

$$\phi_n(x) = \frac{y_n(x)}{\sqrt{\int_a^b y_n^2(x) dx}}, \quad \int_a^b \phi_n^2(x) dx = 1$$

$$\{\phi_n(x)\}_{n=1}^{\infty}$$

Number 3, the multiplicity  $m$  of a non zero eigen value is finite for every symmetric kernel, where the kernel  $K(x,s)$  is square integrable on the square  $[a,b] \times [a,b]$ , so that means, if the kernel is symmetric and square integrable over the square  $[a,b] \times [a,b]$ , then every non zero eigen value having multiplicity  $m$  that means, multiplicity should be a finite quantity.

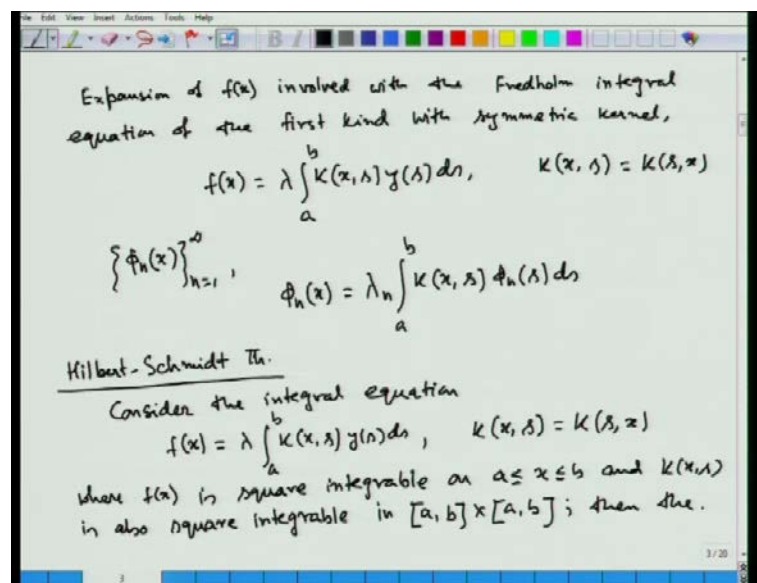

Now, with this and some other related results regarding the completeness of this set of eigen functions, we can find out the orthogonal expansion or fourier expansion of the kernel  $K(x,s)$  in terms of the eigen functions. So first of all, we can write that  $K(x,s)$  can be written as summation  $n$  running from 1 to infinity  $\gamma_n y_n(x)$ , where this  $\gamma_n$  is defined by  $\int_a^b K(x,s) y_n(x) dx$  divided by  $\int_a^b y_n^2(x) dx$ . Now, this representation can be simplified, if we use the orthonormal eigen functions instead of set of orthogonal eigen functions  $y_n(x)$ .

So, if we define  $\phi_n(x)$  is equal to  $y_n(x)$  divided by square root of  $\int_a^b y_n^2(x) dx$ , then we can easily verify that  $\int_a^b \phi_n^2(x) dx$ , this is equal to 1 and therefore, we can expand this kernel  $K(x,s)$  in terms of this orthonormal eigen functions  $\phi_n(x)$ , so that means, we can consider this set of orthonormal eigen functions  $\phi_n(x)$   $n$  running from 1 to infinity.

Now, based upon all this observations and other related results, we can develop the Hilbert Smith theorem and this Hilbert Smith theorem is related with the expansion of  $f$

$x$ , that is the inhomogeneous part of the Fredholm integral equation associated with the given Fredholm integral equation with symmetric kernel. The result states that, **the result states that** if we consider the integral equation of the form  $f(x) = \lambda \int_a^b K(x,s)y(s)ds$ , where this  $K(x,s)$  is actually symmetric kernel, then  $f(x)$  can be expressed as an orthogonal expansion or you can say Fourier series expansion in terms of the functions  $\phi_n(x)$ .

(Refer Slide Time: 10:57)

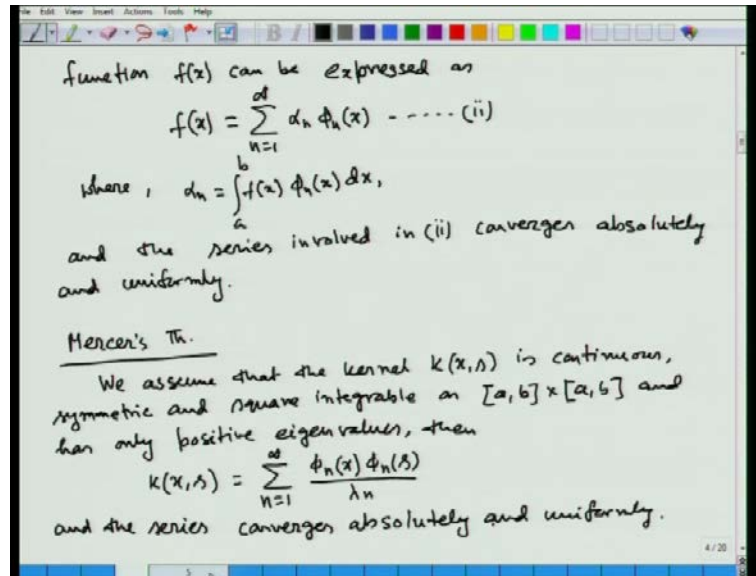

So, what we are going to do, we are actually intended to find out expansion of  $f(x)$  involved with the Fredholm **Fredholm** integral equation of the first kind with symmetric kernel, which is given by  $f(x) = \lambda \int_a^b K(x,s)y(s)ds$ , this is symmetric so that means, it satisfies the condition, this one. In terms of the orthonormal eigen functions  $\phi_n(x)$  and these  $\phi_n(x)$  is actually related by this formula, that is  $\phi_n(x) = \lambda_n \int_a^b K(x,s)\phi_n(s)ds$ .

So that means, this  $\phi_n(x)$ , they are the eigen functions and  $\lambda_n$  they are the eigen values of the Fredholm integral equation, that  $y(x) = \lambda \int_a^b K(x,s)y(s)ds$ , so with this heads we can now state the Hilbert Smith theorem, this is the Hilbert Smith theorem. Considered the integral equation,  $f(x) = \lambda \int_a^b K(x,s)y(s)ds$  with symmetric kernel  $K(x,s) = K(s,x)$ , where  $f(x)$  is square integrable on the closed interval  $a \leq x \leq b$  and  $K(x,s)$  is also square integrable in  $[a,b] \times [a,b]$ ; then the.

equal to  $b$  and the kernel  $K(x, s)$  is also square integrable is also square integrable in the square  $a, b \times a, b$ .

(Refer Slide Time: 14:40)

Then, the function  $f(x)$  can be expressed as  $f(x)$  can be expressed as  $f(x) = \sum_{n=1}^{\infty} \alpha_n \phi_n(x)$  we call this particular series as two, where  $\alpha_n$  are obtained from this formula  $\alpha_n = \int_a^b f(x) \phi_n(x) dx$  and the series involved in two converges, absolutely and uniformly this is actually Hilbert Smith theorem. So, if we just go through this theorem again, so first of all we are going to express  $f(x)$ , which is involved with the Fredholm integral equation of first kind with symmetric kernel, in terms of the set of orthonormal eigen functions obtained by solving the problem  $y(x) = \lambda \int_a^b K(x, s) y(s) ds$ , where this  $K(x, s)$  is a symmetric kernel.

So, once we are able to find out the orthonormal set of eigen functions  $\phi(x)$  then, this  $f(x)$  can be expressed as  $f(x) = \sum_{n=1}^{\infty} \alpha_n \phi_n(x)$ , where each  $\alpha_n$  can be obtained from the formula  $\alpha_n = \int_a^b f(x) \phi_n(x) dx$  and here you have to keep in mind one important result, that this theorem is applicable whenever this  $f(x)$  is square integrable over the interval  $a, b$  and apart from the symmetric kernel  $K(x, s)$  this kernel should be square integrable over the square  $a, b \times a, b$ .

These theorem and now we are going to define another theorem that is Mercer's theorem, they are essential to find out the solutions of the Fredholm integral equation with symmetric kernel, where the resolvent kernel of the Fredholm integral equation can be expressed in terms of this orthonormal eigen functions. So, now, we state another theorem this is Mercer's theorem, it states that, we assume that the kernel  $K(x, s)$  is continuous symmetric and square integrable on  $a \leq x \leq b$  and  $a \leq s \leq b$  and has only positive eigen values, then  $K(x, s)$  that is the symmetric kernel can be expressed as  $\sum_{n=1}^{\infty} \phi_n(x) \phi_n(s) / \lambda_n$  and the series involved with this expression, converges, absolutely and uniformly.

So that means, using two theorems, we can obtain the orthogonal series expansion or fourier series expansion for  $f(x)$  and the kernel  $K(x, s)$ . Now, using this result now we can find out the solution of the Fredholm integral equation with symmetric kernel.

(Refer Slide Time: 20:00)

Sol<sup>n</sup> of Fredholm integral equation of 2nd kind with symmetric kernel:-

$$y(x) = f(x) + \lambda \int_a^b K(x, s) y(s) ds$$

$$y(x) = \lambda \int_a^b K(x, s) y(s) ds$$

$\{\phi_n(x)\}$

The resolvent kernel of  $K(x, s)$  associated with the integral equation can be expressed as

$$R(x, s; \lambda) = \sum_{n=1}^{\infty} \frac{\phi_n(x) \phi_n(s)}{\lambda_n - \lambda}, \quad \lambda \neq \lambda_n$$

and solution of the inhomogeneous eq<sup>n</sup> is

$$y(x) = f(x) + \lambda \sum_{n=1}^{\infty} \frac{\phi_n(x) \phi_n(s)}{\lambda_n - \lambda}$$

So, we are going to find out the solution of Fredholm integral equation of second kind with symmetric kernel, so that means, our target is to find the solution of this equation  $y(x) = f(x) + \lambda \int_a^b K(x, s) y(s) ds$ .

And in order to find out solution of this particular problem, first of all we have to calculate the orthonormal eigen functions from the associated homogeneous problem, that is  $y(x) = \lambda \int_a^b K(x, s) y(s) ds$ . Actually the resolvent kernel are  $x, s, \lambda$  corresponding to the symmetric kernel  $K(x, s)$  can

be expressed as the set of orthonormal eigen functions  $\phi_n(x)$ , corresponding to the set of eigen values  $\lambda_n$  associated with this homogeneous Fredholm integral equation.

The resolvent kernel of  $K(x, s)$  associated with the integral equation associated with the integral equation can be expressed as  $R(x, s, \lambda)$  this is equal to  $\sum_{n=1}^{\infty} \phi_n(x) \phi_n(s) \frac{1}{\lambda_n - \lambda}$ , when  $\lambda \neq \lambda_n$  and hence the solution of the inhomogeneous equation can be written as solution of the inhomogeneous equation is  $y(x)$  is equal to  $f(x) + \lambda \sum_{n=1}^{\infty} \alpha_n \phi_n(x) \frac{1}{\lambda_n - \lambda}$ , where  $\alpha_n$  is  $\int_a^b f(x) \phi_n(x) dx$ .

(Refer Slide Time: 23:41)

where, 
$$\alpha_n = \int_a^b f(x) \phi_n(x) dx$$

$$y(x) = f(x) + \lambda \int_a^b K(x, s) y(s) ds$$

$$g(x) = y(x) - f(x)$$

$$g(x) = \lambda \int_a^b K(x, s) y(s) ds$$

According to the H-S th.,

$$g(x) = \sum_{n=1}^{\infty} \beta_n \phi_n(x)$$

$$\beta_n = \int_a^b g(x) \phi_n(x) dx$$

Now, we can try to derive this result using the Hilbert Smith theorem and other notations we have introduced earlier, that is we need the definition for this  $\alpha_n$  actually and then we can find out the solution to the Fredholm integral equation. So, given equation is  $y(x) = f(x) + \lambda \int_a^b K(x, s) y(s) ds$ . Now, if we define the function  $g(x) = y(x) - f(x)$ , then this given Fredholm integral equation inhomogeneous Fredholm integral equation of second kind can be put into the form, that  $g(x) = \lambda \int_a^b K(x, s) y(s) ds$ , now for this problem we can apply the Hilbert Smith theorem.

So, according to Hilbert Smith theorem, we can write  $g(x)$  is equal to  $\sum_{n=1}^{\infty} \beta_n \phi_n(x)$ , where  $\beta_n$  is  $\int_a^b g(x) \phi_n(x) dx$ , this result we can write using Hilbert Smith theorem.

(Refer Slide Time: 26:08)

$$\beta_n = \int_a^b g(x) \phi_n(x) dx = \int_a^b y(x) \phi_n(x) dx - \int_a^b f(x) \phi_n(x) dx$$

$$= \delta_n - \alpha_n,$$

where,  $\delta_n = \int_a^b y(x) \phi_n(x) dx$ .

$$\beta_n = \int_a^b (y(x) - f(x)) \phi_n(x) dx$$

$$= \int_a^b \left[ \int_a^b k(x,s) y(s) ds \right] \phi_n(x) dx$$

$$= \lambda \int_a^b y(s) \left[ \int_a^b k(x,s) \phi_n(x) dx \right] ds$$

Now, this  $\beta_n$ , this is equal to  $\int_a^b g(x) \phi_n(x) dx$  and this is equal to  $\int_a^b y(x) \phi_n(x) dx$  minus  $\int_a^b f(x) \phi_n(x) dx$  and this is equal to we can write  $\delta_n$  minus  $\alpha_n$ , where  $\alpha_n$  already we have defined as  $\int_a^b f(x) \phi_n(x) dx$ .

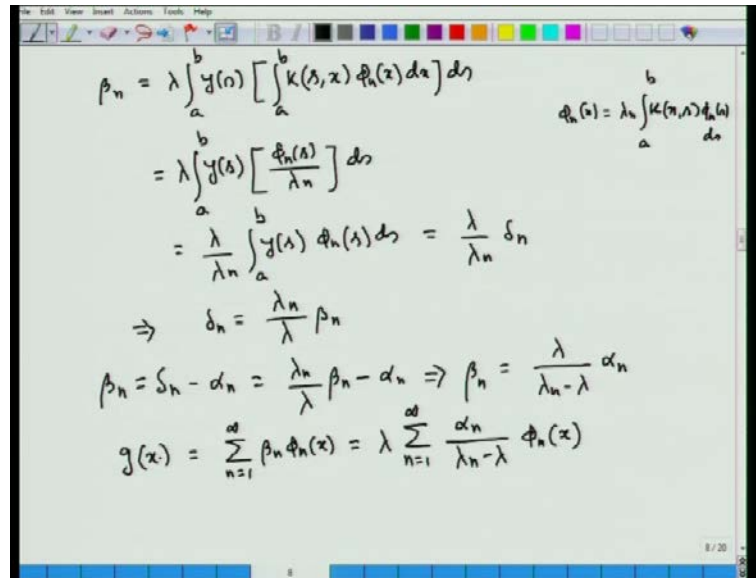

So, here this  $\delta_n$  is equal to  $\int_a^b y(x) \phi_n(x) dx$ . Now, for this problem  $y(x)$  is the unknown function so that means,  $\delta_n$  is also unknown, so our target will be replaced this  $\delta_n$  in terms of some known quantities such that, we can find out the solution of the Fredholm integral equation, and mainly for the given problem you can understand  $f(x)$  is given. Once  $f(x)$  is given, so if somehow we are able to relate this  $\delta_n$  with  $\alpha_n$  then, we can find out this  $\beta_n$  in terms of  $\alpha_n$  and hence we can find out the solution of the given problem.

So, for this purpose we can write this  $\beta_n$  is equal to  $\int_a^b y(x) \phi_n(x) dx$ , this is equal to  $\int_a^b$ , we can substitute  $y(x) - f(x)$ , this is equal to  $\lambda \int_a^b k(x,s) y(s) ds$ . So, from there we can write, this is  $\lambda \int_a^b k(x,s) \left[ \int_a^b k(x,s) \phi_n(x) dx \right] ds$ , this expression with  $\phi_n(x) dx$ . Now, we can interchange the order of the integration, we can take  $\lambda$  outside the integral sign,

so this will be  $\lambda \int_a^b y(s) \left[ \int_a^b K(s, x) \phi_n(x) dx \right] ds$ , then  $\int_a^b K(s, x) \phi_n(x) dx$  and this is a very crucial step, because we are already familiar with the expression that  $\phi_n(x)$  is equal to  $\lambda \int_a^b K(x, s) \phi_n(s) ds$  with  $\lambda$  equal to  $\lambda_n$ .

(Refer Slide Time: 29:44)

The image shows a whiteboard with the following handwritten mathematical derivations:

$$\beta_n = \lambda \int_a^b y(s) \left[ \int_a^b K(s, x) \phi_n(x) dx \right] ds$$

$$= \lambda \int_a^b y(s) \left[ \frac{\phi_n(s)}{\lambda_n} \right] ds$$

$$= \frac{\lambda}{\lambda_n} \int_a^b y(s) \phi_n(s) ds = \frac{\lambda}{\lambda_n} \delta_n$$

$$\Rightarrow \delta_n = \frac{\lambda_n}{\lambda} \beta_n$$

$$\beta_n = \delta_n - \alpha_n = \frac{\lambda_n}{\lambda} \beta_n - \alpha_n \Rightarrow \beta_n = \frac{\lambda}{\lambda_n - \lambda} \alpha_n$$

$$g(x) = \sum_{n=1}^{\infty} \beta_n \phi_n(x) = \lambda \sum_{n=1}^{\infty} \frac{\alpha_n}{\lambda_n - \lambda} \phi_n(x)$$

On the right side of the whiteboard, there is a definition:  $\phi_n(s) = \lambda_n \int_a^b K(s, r) \phi_n(r) dr$ .

So, in order to apply that result, we can use the property of symmetric kernel to interchange the variables. And therefore, we can write this  $\beta_n$  is equal to  $\lambda$  times  $\int_a^b y(s) \left[ \int_a^b K(s, x) \phi_n(x) dx \right] ds$ , this is the result. Now, using that definition that is the result  $\phi_n(x)$  is equal to  $\lambda_n \int_a^b K(x, s) \phi_n(s) ds$ , we can find that  $\int_a^b K(s, x) \phi_n(x) dx$  is nothing but,  $\frac{1}{\lambda_n} \int_a^b K(x, s) \phi_n(s) ds$ .

So, therefore, this will be equal to  $\lambda$  times  $\int_a^b y(s) \left[ \int_a^b K(s, x) \phi_n(x) dx \right] ds$ , the expression under the square bracket will be simply  $\phi_n(s)$  divided by  $\lambda_n$ , so this is equal to  $\frac{\lambda}{\lambda_n} \int_a^b y(s) \phi_n(s) ds$ , this one (Refers Slide Time: 31:20). And this is equal to  $\frac{\lambda}{\lambda_n} \delta_n$ , because we have used the notation  $\int_a^b K(x, s) \phi_n(s) ds = \lambda_n \phi_n(x)$ . And from here, we can write  $\delta_n$  this is equal to  $\frac{\lambda_n}{\lambda} \beta_n$  and therefore,  $\beta_n$  is equal to  $\delta_n - \alpha_n = \frac{\lambda_n}{\lambda} \beta_n - \alpha_n$ .

These implies beta n, this is equal to lambda divided by lambda n minus lambda times alpha n. So, we have obtained this beta n and hence, this g x is equal to sigma n running from 1 to infinity beta n phi n x. So, that is equal to lambda sigma n running from 1 to infinity alpha n divided by lambda n minus lambda times phi n x.

(Refer Slide Time: 33:08)

$$\begin{aligned}
 y(x) &= f(x) + \lambda \sum_{n=1}^{\infty} \frac{\alpha_n}{\lambda_n - \lambda} \phi_n(x) \\
 &= f(x) + \lambda \sum_{n=1}^{\infty} \frac{\phi_n(x)}{\lambda_n - \lambda} \int_a^b f(s) \phi_n(s) ds \\
 &= f(x) + \lambda \int_a^b f(s) \left[ \sum_{n=1}^{\infty} \frac{\phi_n(x) \phi_n(s)}{\lambda_n - \lambda} \right] ds \\
 y(x) &= f(x) + \lambda \int_a^b R(x, s; \lambda) f(s) ds \\
 R(x, s; \lambda) &= \sum_{n=1}^{\infty} \frac{\phi_n(x) \phi_n(s)}{\lambda_n - \lambda}
 \end{aligned}$$

And therefore, using  $y(x) = f(x) + \lambda \int_a^b R(x, s; \lambda) f(s) ds$ , we can write  $y(x)$  this is equal to  $f(x)$  plus  $\lambda$  sigma  $n$  running from 1 to infinity  $\alpha_n$  divided by  $\lambda_n - \lambda$  times  $\phi_n(x)$ . Now, if we substitute the expression for  $\alpha_n$ , so this will be equal to  $f(x)$  plus  $\lambda$  sigma running from 1 to  $n$   $\phi_n(x)$  divided by  $\lambda_n - \lambda$  times  $\int_a^b f(s) \phi_n(s) ds$ .

Now, already we have discussed about the uniform convergence of this particular infinite series, that is sigma  $n$  running from 1 to infinity  $\alpha_n \phi_n(x)$  associated with the  $f(x)$  and therefore, interchanging the summation and integral sign, we can write this is equal to  $f(x)$  plus  $\lambda$  integral  $a$  to  $b$   $f(s)$ , then summation  $n$  running from 1 to infinity  $\phi_n(x) \phi_n(s)$  divided by  $\lambda_n - \lambda$  this  $ds$ .

And clearly you can recall that in terms of resolvent kernel, we have written solution of this particular problem as  $y(x) = f(x) + \lambda \int_a^b R(x, s; \lambda) f(s) ds$ , so we have this expression in the same format and therefore, comparing this  $R(x, s; \lambda)$  with this particular term, we can find that  $R(x, s; \lambda)$  this is equal to sigma  $n$  running from 1 to infinity  $\phi_n(x) \phi_n(s)$  divided by  $\lambda_n - \lambda$ , so this is

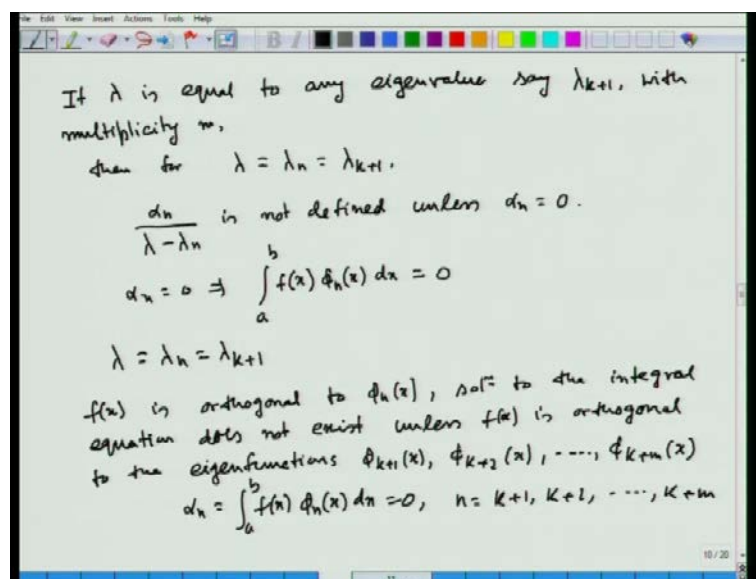

actually the target form of the solution that is, this is the resolvent kernel  $R(x, s, \lambda)$  equal to summation  $n$  running from 1 to infinity  $\phi_n(x) \phi_n(s)$  by  $\lambda^n$  minus  $\lambda$ .

And this expression is valid whenever,  $\lambda \neq \lambda_n$ , so this gives the solution, where this resolvent kernel  $R(x, s, \lambda)$  can be evaluated in terms of the eigen values  $\lambda_n$  and set of orthonormal eigen functions  $\phi_n(x)$ , obtained from the associated homogeneous Fredholm integral equation. So, this is actually the use of Hilbert Smith theorem in order to find out the solution of the Fredholm integral equation.

Now, you have to keep in mind that this treatment is completely based upon the assumptions, that the parameter  $\lambda$  is not equal to any one of the eigen values  $\lambda_n$ , so we have eigen values  $\lambda_1, \lambda_2, \lambda_3$ , and so on. If this parameter  $\lambda$  involved with the Fredholm integral equation is not equal to any one of this eigen values, then we can find out solution by this method.

And therefore, we can find this solution as  $y(x) = f(x) + \lambda \int_a^b R(x, s, \lambda) f(s) ds$  where  $R(x, s, \lambda)$  is the resolvent kernel, and with help of these orthonormal eigen functions, we can find out this resolvent kernel given by the last formula. Now, we consider the case that, if  $\lambda$  is equal to some of the eigen values say  $\lambda_{k+1}$  and I am going to use this  $\lambda_{k+1}$  in order to write the formula in a suitable format and to include the multiplicity of the eigen values.

(Refer Slide Time: 38:02)

So, now if we assume that  $\lambda$  is equal to any eigen value, say  $\lambda_{K+1}$  with multiplicity  $m$ , then for  $\lambda = \lambda_n = \lambda_{K+1}$ , the coefficient that is  $\frac{\alpha_n}{\lambda_n - \lambda}$  is not defined, unless  $\alpha_n = 0$ . Now, we look at the result  $\alpha_n = 0$ , this actually implies  $\int_a^b f(x) \phi_n(x) dx = 0$ .

So that means, for  $\lambda = \lambda_n = \lambda_{K+1}$ , the function  $f(x)$  is orthogonal to the associated eigen function  $\phi_{K+1}(x)$ . If this happens and  $\alpha_n = 0$ , then the quantity  $\frac{\alpha_n}{\lambda_n - \lambda}$  becomes indeterminate when  $\lambda = \lambda_n$ . And therefore, the condition  $\alpha_n = 0$  leads us to the case that,  $\alpha_n$  becomes an arbitrary quantity. And therefore, if  $f(x)$  is orthogonal to  $\phi_n(x)$  solution to the integral equation does not exist, unless  $f(x)$  is orthogonal to the eigen functions,  $\phi_{K+1}(x), \phi_{K+2}(x), \dots, \phi_{K+m}(x)$ , because we have considered that the eigen value  $\lambda = \lambda_{K+1}$  is of multiplicity  $m$  corresponding to the eigen value that is  $K+1$ .

And that means,  $\alpha_n = \int_a^b f(x) \phi_n(x) dx = 0$  for  $n = K+1, K+2, \dots, K+m$ . If these conditions are satisfied, that is  $f(x)$  is orthogonal to each of these eigen functions  $\phi_{K+1}(x), \phi_{K+2}(x), \dots, \phi_{K+m}(x)$ .

(Refer Slide Time: 42:21)

The image shows a whiteboard with handwritten mathematical notes. At the top, the general solution of an integral equation is given as:

$$y(x) = f(x) + \lambda \sum_{\substack{n=1 \\ n \neq k+1, k+2, \dots, k+m}}^{\infty} \frac{\alpha_n \phi_n(x)}{\lambda_n - \lambda} + \sum_{j=k+1}^{k+m} C_j \phi_j(x).$$

Below this, an example is provided:

$$\text{Ex 1} \quad y(x) = x + \lambda \int_0^1 k(x,s) y(s) ds$$

$$k(x,s) = \begin{cases} s(x-s), & 0 \leq s \leq x \\ x(s-x), & x \leq s \leq 1 \end{cases}$$

Then, it says "Consider the associated homogeneous eqn.":

$$y(x) = \lambda \int_0^1 k(x,s) y(s) ds$$

Finally, the boundary value problem (BVP) is stated as:

$$\text{BVP} \quad y''(x) - \lambda y(x) = 0, \quad y(0) = 0, \quad y(1) = 0$$

Then, we can write the solution to the given problem as  $y(x) = f(x) + \lambda \sum_{n=1}^{\infty} \frac{\alpha_n \phi_n(x)}{\lambda_n - \lambda} + \sum_{j=k+1}^{k+m} C_j \phi_j(x)$ .

plus  $m$   $\alpha_n \phi_n(x)$  divided by  $\lambda_n - \lambda$  plus summation  $j$  running from  $K+1$  to  $K+m$   $C_j \phi_j(x)$ , where all these  $C_j$ 's are actually arbitrary constants. And in this case, when  $\phi(x)$  is orthogonal to the eigen functions  $\phi_{K+1}(x)$ ,  $\phi_{K+2}(x)$  up to  $\phi_{K+m}(x)$ , associated with the eigen value  $\lambda_n$  equal to  $\lambda_{K+1}$ , then we have infinitely many solutions of the given problem.

Finally, we consider two examples in order to understand these results that means, how this can be used to find out solution of the Fredholm integral equation, so first of all we consider the problem  $y(x) = x + \lambda \int_0^1 K(x,s)y(s)ds$ , where  $K(x,s)$  is equal to  $s(x-s)$  for  $0 \leq s \leq x$  and  $x(s-x)$  for  $x \leq s \leq 1$ , we have to solve this equation in terms of orthogonal eigen functions.

So first of all, we have to consider the associated homogeneous equation, that is  $y(x) = \lambda \int_0^1 K(x,s)y(s)ds$ . Earlier we have discussed how this type of problem can be converted to boundary value problem. So, using the same tricks and the form of the kernel  $K(x,s)$ , differentiating these equation twice, you can convert this problem to a boundary value problem, which is defined by  $y''(x) - \lambda y(x) = 0$  with the boundary conditions  $y(0) = 0$  and  $y(1) = 0$ .

(Refer Slide Time: 45:59)

$$\lambda_n = -n^2 \pi^2, \quad n=1, 2, 3, \dots$$

$$y_n(x) = \sin(n\pi x), \quad n=1, 2, 3, \dots$$

$$\phi_n(x) = \sqrt{2} \sin(n\pi x)$$

$$\alpha_n = \int_0^1 f(x) \phi_n(x) dx = \sqrt{2} \int_0^1 x \sin(n\pi x) dx$$

$$= \sqrt{2} \left[ -\frac{x \cos(n\pi x)}{n\pi} \Big|_0^1 + \frac{1}{n\pi} \int_0^1 \cos(n\pi x) dx \right]$$

$$= \sqrt{2} (-1) \frac{\cos(n\pi)}{n\pi} = (-1)^{n+1} \frac{\sqrt{2}}{n\pi}$$

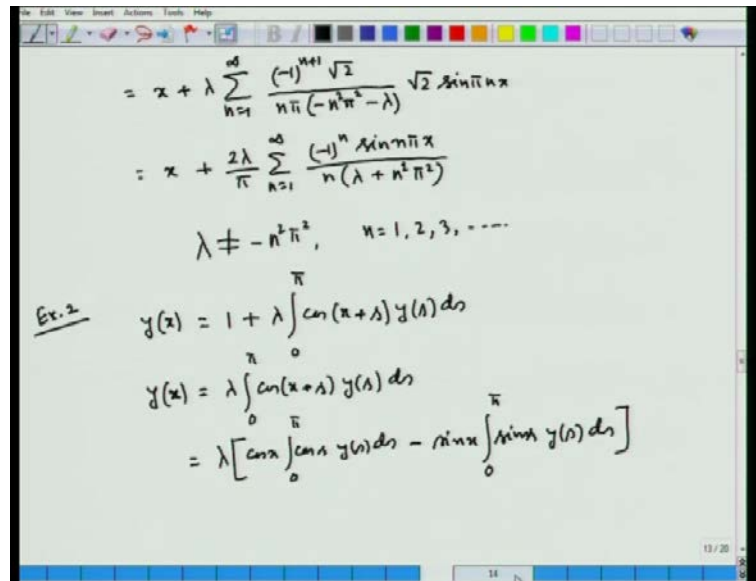

$$y(x) = x + \lambda \sum_{n=1}^{\infty} \frac{\alpha_n}{\lambda_n - \lambda} \phi_n(x)$$

And using the standard procedure of eigen value eigen functions for this particular problem, you can calculate the eigen values of this particular problem exist, whenever  $\lambda$  is negative. And in particular the eigen values are given by  $\lambda_n$  equal to  $-\pi^2 n^2$ , where  $n = 1, 2, 3, \dots$ . And the corresponding eigen functions  $y_n(x)$  is equal to  $\sin(n\pi x)$ , where  $n = 1, 2, 3, \dots$ .

And for this eigen functions  $y_n(x) = \sin(n\pi x)$ , we can calculate the corresponding set of orthonormal eigen functions, that is  $\phi_n(x)$  this will be  $\frac{1}{\sqrt{2}} \sin(n\pi x)$ . Now, with this  $\phi_n(x)$  where  $n$  ranging from 1, 2, 3, up to infinity we can calculate this  $\alpha_n$  is equal to  $\int_0^1 f(x) \phi_n(x) dx$  for the given problem the non homogeneous part is  $x$ , so therefore,  $f(x) = x$ , so this is equal to  $\frac{1}{\sqrt{2}} \int_0^1 x \sin(n\pi x) dx$ . And using the formula for integration by parts we can derive this is  $\frac{1}{\sqrt{2}} \left[ -x \cos(n\pi x) \Big|_0^1 + \int_0^1 \cos(n\pi x) dx \right]$  and this will be equal to  $\frac{1}{\sqrt{2}} \left[ -\cos(n\pi) + \frac{\sin(n\pi)}{n\pi} \Big|_0^1 \right]$ .

Last integral will be exactly equal to 0 and if we substitute it to the first term  $x = 0$ , that is lower limit that will be also 0, so you will be survived only with the term  $\frac{1}{\sqrt{2}} (-\cos(n\pi))$ . Now  $\cos(n\pi)$  is equal to  $(-1)^n$ , so this is equal to  $\frac{1}{\sqrt{2}} (-1)^{n+1}$  times  $\frac{1}{n\pi}$ . So, this is actually value for  $\alpha_n$  and then we can find out the solution to the given problem, that  $y(x)$  is equal to  $x + \sum_{n=1}^{\infty} \frac{\alpha_n}{\lambda_n} \phi_n(x)$ .

(Refer Slide Time: 49:10)

$$\begin{aligned}
 &= x + \lambda \sum_{n=1}^{\infty} \frac{(-1)^{n+1} \sqrt{2}}{n\pi(-n^2\pi^2 - \lambda)} \sqrt{2} \sin n\pi x \\
 &= x + \frac{2\lambda}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n \sin n\pi x}{n(\lambda + n^2\pi^2)} \\
 &\quad \lambda \neq -n^2\pi^2, \quad n=1, 2, 3, \dots
 \end{aligned}$$

Ex. 2

$$\begin{aligned}
 y(x) &= 1 + \lambda \int_0^{\pi} \cos(x+s) y(s) ds \\
 y(x) &= \lambda \int_0^{\pi} \cos(x+s) y(s) ds \\
 &= \lambda \left[ \cos x \int_0^{\pi} \cos s y(s) ds - \sin x \int_0^{\pi} \sin s y(s) ds \right]
 \end{aligned}$$

So, substituting we can find  $x$  plus  $\lambda$  sigma  $n$  running from 1 to infinity minus 1 to the power  $n$  plus 1 root 2 divided by  $n$  pi minus  $n$  square pi square minus  $\lambda$  multiplied by root 2 sin  $n$  pi  $x$ . Now, if we take minus 1 common from the denominator and this 2 by pi outside the summation sin, so therefore, we can find solution of this problem as  $y(x)$  equal to  $\frac{2\lambda}{\pi}$  summation  $n$  running from 1 to infinity minus 1 to the power  $n$  sin  $n$  pi  $x$  divided by  $n$  into  $\lambda$  plus  $n$  square pi square.

So, that means, this solution  $y(x)$  equal to  $x$  plus  $\frac{2\lambda}{\pi}$  sigma  $n$  running from 1 to infinity minus 1 whole to the power  $n$  sin  $n$  pi  $x$  divided by  $n$  into  $\lambda$  plus  $n$  square pi square, this is a valid solution whenever  $\lambda$  is not equal to minus  $n$  square pi square for  $n$  equal to 1, 2, 3, and so on.

If  $\lambda$  is not equal to any one of this eigen values, then we have this particular solution. Next, we consider another example this is very interesting example, where we can show that depending up on values of  $\lambda$  we have three situations that is unique solution, no solution and infinite remaining solutions. The problem is  $y(x)$  equal to  $1$  plus  $\lambda$  integral 0 to pi cos of  $x$  plus  $s$   $y(s)$   $ds$ .

So, first of all we have to find out eigen values and eigen functions for  $y(x)$  equal to  $\lambda$  integral 0 to pi cos of  $x$  plus  $s$   $y(s)$   $ds$  and using the procedure of separable kernel, we can calculate the eigen values and we can recall that, we can rewrite this expression as  $\cos x$  integral 0 to pi cos  $s$   $y(s)$   $ds$  minus  $\sin x$  integral 0 to pi sin  $s$   $y(s)$   $ds$  and then

defining this first integral 0 to pi cos y s d s as c 1 and 0 to pi sin y s d s as c 2 we can find out the eigen values and eigen functions for this particular problem.

(Refer Slide Time: 52:29)

The image shows a whiteboard with handwritten mathematical work. At the top, it lists eigenvalues  $\lambda_1 = \frac{2}{\pi}$  and  $\lambda_2 = -\frac{2}{\pi}$ , and corresponding eigenfunctions  $y_1(x) = \cos x$  and  $y_2(x) = \sin x$ . Below these, it shows the orthonormalized eigenfunctions  $\phi_1(x) = \sqrt{\frac{2}{\pi}} \cos x$  and  $\phi_2(x) = \sqrt{\frac{2}{\pi}} \sin x$ . Then, it calculates the constants  $\alpha_1$  and  $\alpha_2$  using integrals from 0 to  $\pi$ .  $\alpha_1 = \int_0^{\pi} f(x) \phi_1(x) dx = \sqrt{\frac{2}{\pi}} \int_0^{\pi} \cos x dx = 0$  and  $\alpha_2 = \int_0^{\pi} f(x) \phi_2(x) dx = \sqrt{\frac{2}{\pi}} \int_0^{\pi} \sin x dx = 2\sqrt{\frac{2}{\pi}}$ . Finally, it presents 'Case-1' where  $\lambda \neq \lambda_1, \lambda_2$  and gives the general solution  $y(x) = f(x) + \lambda \sum_{n=1}^2 \frac{\alpha_n}{\lambda_n - \lambda} \phi_n(x)$ , which simplifies to  $1 - \frac{4\lambda}{2 + \lambda\pi} \sin x$ .

I am not going to solve that part and if you solve it then you can find lambda 1 is equal to 2 by pi and lambda 2 this is equal to minus 2 by pi. And associated eigen functions will be y 1 x this is equal to cos x and y 2 x this is equal to sin x, so these are eigen values and eigen functions. Now, if we use the ortho-normalization condition, then we can find orthonormal eigen functions that is phi 1 x is equal to root of our 2 by pi cosine x and phi 2 x, this is equal to root of our 2 by pi sin x and from here this phi 1 and phi 2, we can calculate the constants alpha 1 and alpha 2, because here we have only two eigen functions, this root of at 2 by pi cosine x and root of at 2 by pi sin x, so we have to calculate only two constants alpha 1 and alpha 2.

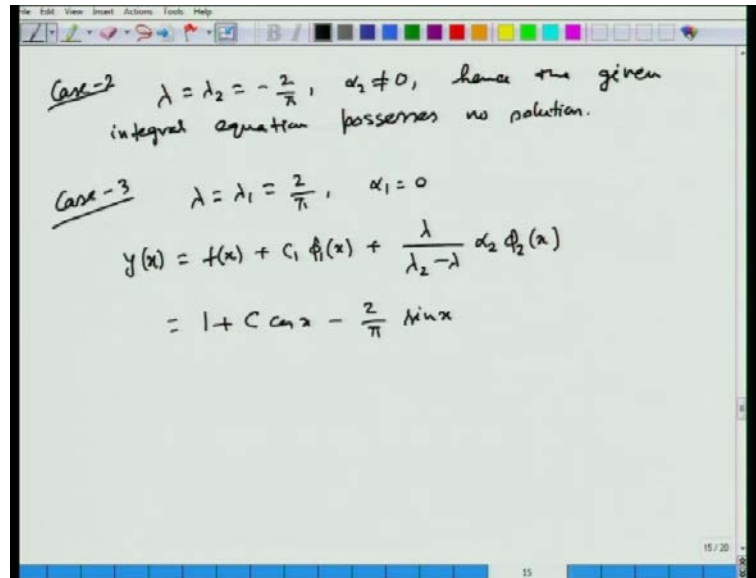

So, alpha 1 is equal to integral 0 to pi f x phi 1 x d x, this is equal to root of at 2 by pi integral 0 to pi co sin x d x, this is equal to 0 and alpha 2 this is equal to integral 0 to pi f x phi 2 x d x, so this is equal to root of at 2 by pi integral 0 to pi sin x d x, this is equal to 2 into root of at 2 by pi.

So, with these result case 1, if we consider that lambda not equal to lambda 1 comma lambda 2, then y x will be equal to f x plus lambda sigma n equal to 1 to 2 alpha n divided by lambda n minus lambda phi n x. Now, alpha 1 is equal to 0 and alpha 2 we have obtained here, so after substituting you can find this is equal to 1 minus 4 lambda

divide by  $2 + \lambda \pi \sin x$ , this is the unique solution to the given problem. When  $\lambda$  not equal to either  $\lambda_1$  or  $\lambda_2$ .

(Refer Slide Time: 55:24)

Case 2, if  $\lambda$  equal to  $\lambda_2$  is equal to  $-\frac{2}{\pi}$  and has  $\lambda_2$  not equal to 0, hence the given equation, given integral equation possesses no solution, there is no solution for this problem. And case 3, if  $\lambda$  equal to  $\lambda_1$  is equal to  $\frac{2}{\pi}$  by  $\alpha_1$  equal to 0 and in this case problem have infinitely many solutions, those are given by  $y(x) = f(x) + c_1 \phi_1(x) + \frac{\lambda}{\lambda_2 - \lambda} \alpha_2 \phi_2(x)$  and this will be equal to  $1 + c \cos x - \frac{2}{\pi} \sin x$ , this  $c$  is the arbitrary constant, so this is your infinite number of solutions.

So, these example we have explained that depending upon  $\lambda$ , whether it is equal to  $\lambda_1$  or  $\lambda_2$  and if these are not equal to either of this eigen values of the problem then we have unique solution, if  $\lambda$  equal to  $\lambda_2$  then the given problem does not possess any solution and in case of  $\lambda$  equal to  $\lambda_1$ , then we have infinitely many solutions.

So, this illustrates the method we have described, to find out the solution of the Fredholm integral equation with the help of Hilbert Smith theorem. So, I can stop this lecture at this point. Thank you for your attention.
