Tutorial V

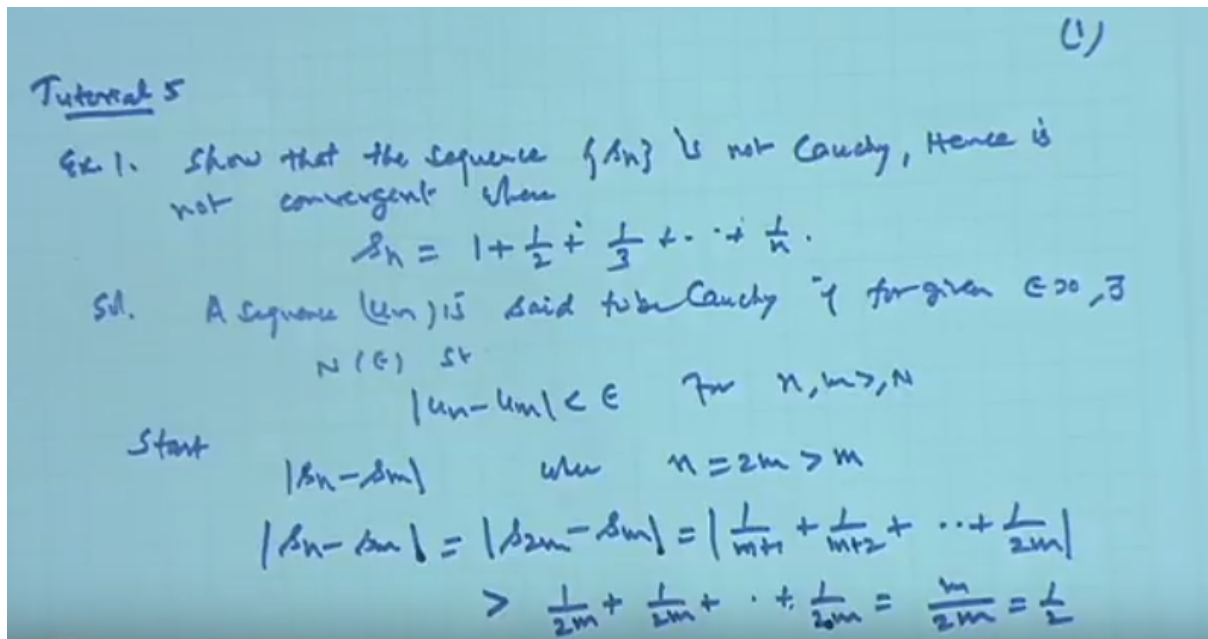

Course

On

Introductory Course in Real Analysis

So this is that again tutorial class, tutorial five, based on the lectures starting from 21st to 25th, based on this.

(Refer Slide Time: 00:34)

So let us see few problems, we will discuss. So that the sequence S_N , sequence S_N , is not Cauchy. Hence, is not convergent. The sequences in, where S_N has, 1, plus 1 by 2, 1 by 3, plus 1 by. So we have to show this sequence is not a Cauchy sequence, hence it is not a convergent. So Cauchy sequence means, a sequence is said to be a Cauchy, a sequence U_N , is said to be Cauchy, of real number, is said to be Cauchy, if for given epsilon, greater than 0, there exist a capital N , depending on epsilon, such that, mode of U_N , minus u_m , less than epsilon, for all n, m , greater than equal to capital N . So if it is not cauchy, it means we cannot get the difference of any two terms of the sequence, after a stage n , is less than epsilon. So let us start with, mode less of S_N minus S_M . And suppose n is greater than m , start with, where, say n is equal to say $2M$ greater than M . Start with this. Okay? So what will be the S_N minus S_M ? So S_N minus S_M , this will be equal to, s, $2m$, minus S_M ? And which is equal to 1 over M plus 1 , M plus 2 , up to say 1 by $2m$? So this will be, greater than. Now the smallest term is 1 by $2m$? So this is greater than 1 by $2m$, into 1 by, plus 1 by $2m$, up to n terms, n terms, so 1 by $2m$ and so this is M over $2m$, which is $\frac{1}{2}$. So what we get is s_n minus s_m , is greater than $\frac{1}{2}$. Whatever the N and may be, large, so it cannot be.

(Refer Slide Time: 03:11)

Sol. A sequence (u_n) is said to be Cauchy if for given $\epsilon > 0, \exists N(\epsilon)$ st
 $|u_n - u_m| < \epsilon$ for $n, m > N$

Start $|s_n - s_m|$ when $n = 2m > m$

$$|s_n - s_m| = |s_{2m} - s_m| = \left| \frac{1}{m+1} + \frac{1}{m+2} + \dots + \frac{1}{2m} \right|$$

$$> \frac{1}{2m} + \frac{1}{2m} + \dots + \frac{1}{2m} = \frac{m}{2m} = \frac{1}{2}$$

Choose $\epsilon = \frac{1}{2}$, $\nexists N$ st. $|s_n - s_m| < \frac{1}{2}$ for $n, m > N$

\therefore It is also not convergent. \therefore Every Cauchy seq of R or C is conv. & vice versa.

So if we choose, m epsilon to be $1/2$, then we cannot find an H , there does not exist an N , such that, m of s_n , minus s_m , less than half, for all n, m , greater than equal to n . So this shows, it is not a Cauchy sequence. And we know if a Sequence, of real or complex number, if it is Cauchy, then it must be convergent. So since it is not cauchy, therefore it is also not convergent. Because of every Cauchy sequence of real complex number, is convergent, because every Cauchy sequence of real or complex number is convergent and vice versa. So this result we have already discussed so this shows.

(Refer Slide Time: 04:16)

Ex2 Consider the sequence $\{n(-1)^n\}$. Test the convergence of the sequence

Sol. $\{-1, 2, -3, 4, -5, \dots\}$

$2, 4, 6, \dots \rightarrow \infty$ Unbdd sequence.
 $-1, -3, \dots \rightarrow -\infty$ Hence not convergent

Ex3 Use Cauchy Criteria of convergence to prove that $\{x_n\}$ is convergent, where

$$x_n = 1 + \frac{1}{2^2} + \frac{1}{3^2} + \dots + \frac{1}{n^2}$$

Sol. A sequence (a_n) of R or C is Cauchy \iff it is convergent

$$\frac{1}{1 \cdot n} = \frac{1}{2 \cdot 3 \cdot \dots \cdot n} < \frac{1}{2 \cdot 2 \cdot \dots \cdot 2} = \frac{1}{2^{n-1}}$$

Now exercise, so we can now take a few problems. Suppose we have, contact if sequence, we can just stop, okay. Consider the sequence, sequence, n into minus 1 to the power n . Test the convergence of the sequence, convergence of the sequence. I think is a simple part. What is the sequence? If we look the sequence, the sequence comes out to be, minus 1, 2, minus 3, 4, minus 5, and so on. So we are getting a sequence, subsequence, 2, 4, 6, and so on, which diverges to infinity. Minus 1, minus 3, is

also diverging to minus infinity. Therefore this is an unbounded sequence. Hence, hence diverges and not convergent. So that is really simple part for it, we will not go in detail. Exercise; Use the Cauchy criteria, criteria, of convergence, Cauchy criteria of convergence, to prove, that sequence y_n is convergent. Where Y_N is, $1 + \frac{1}{2} + \frac{1}{2^2} + \dots + \frac{1}{2^{n-1}}$, this is. Okay? So what are the criteria of convergence? Cauchy convergence criteria means, every Cauchy sequence of real complex number, is convergent, or the. A sequence y_n , of real or complex number is Cauchy, if and only if, it is convergent. That result is so. So we will use this result to prove this. That it is a Cauchy sequence hence convergent. So, now let us see, what is our factrum. First see, $1 + \frac{1}{2^n}$. This is basically $2, 3$ up to n . 1 is of course. Now each term is less than, is less than 2 . So $1 + \frac{1}{2}, 2, 2$. So can we say, this is strictly less than $1 + \frac{1}{2}$ to the power n minus 1 . Is it ok? Because 3 is greater than 2 , so $1 + \frac{1}{2}$, is greater than $1 + \frac{1}{3}$, and like this, using.

(Refer Slide Time: 08:13)

$$|y_m - y_n| = \left| \frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{m} \right|$$

$$\leq \frac{1}{2^n} + \frac{1}{2^{n+1}} + \dots + \frac{1}{2^{m-1}}$$

$$= \frac{1}{2^n} \left[1 + \frac{1}{2} + \dots + \frac{1}{2^{m-n-1}} \right]$$

$$= \frac{1}{2^n} \cdot \frac{1 - \left(\frac{1}{2}\right)^{m-n}}{1 - \frac{1}{2}} = \frac{1}{2^n} \cdot \frac{1}{1 - \frac{1}{2}} = \frac{1}{2^{n-1}}$$

Since $\frac{1}{2^{n-1}} \rightarrow 0$ as $n \rightarrow \infty$, we have for every $\epsilon > 0$,

$\exists N \in \mathbb{N}$ s.t. $\frac{1}{2^{n-1}} < \epsilon$ for $n \geq N$.

$|y_m - y_n| < \epsilon$ for $m, n > N$.

Hence (y_n) is a Cauchy seq.

(y_n) is convergent sequence

So use this thing, we now have, y_m , minus y_n . Where M, I am choosing, greater than n . So this is equal to, $1 + \frac{1}{2^n} + \frac{1}{2^{n+1}} + \dots + \frac{1}{2^{m-1}}$. This is the same as, less than, $1 + \frac{1}{2^n}$, just now $1 + \frac{1}{2^n}$ is less than $1 + \frac{1}{2^n}$ to the power n minus 1 ? So it is less than $1 + \frac{1}{2^n}$. This is less than $1 + \frac{1}{2^n}$ plus 1 and this is less than 2 to the power n minus 1 . So from here we can say, $1 + \frac{1}{2^n}$ if we take outside, then inside we get, $1 + \frac{1}{2^n}$, plus $1 + \frac{1}{2^{n+1}}$, minus 1 , and that will be equal to limit $1 + \frac{1}{2^n}$, in geometric series, $1 - \frac{1}{2}$, raised to the power n minus 1 term, over $1 - \frac{1}{2}$, and that becomes $\frac{1}{2}$. $1 + \frac{1}{2^n}$ into, 1 over, $1 - \frac{1}{2}$, as this is, $1 + \frac{1}{2^n}$, because this is less than, $1 - \frac{1}{2}$, is less than 1 and this is equal to, $1 - \frac{1}{2}$. So totally is $1 + \frac{1}{2^n}$ minus 1 . So y_m minus y_n , is less than 2^n minus 1 . Therefore, since, $1 + \frac{1}{2^n}$ minus 1 goes to 0 , as n tends to infinity, so we have, for every epsilon greater than 0 , there exist an N naught, belonging to capital N , such that $1 + \frac{1}{2^n}$ minus 1 , is less than epsilon, for all N , than equal to n naught. Therefore y_m minus y_n is less than ϵ for all M, N , greater than equal to N naught. This is true, for all n . Hence y_n is a Cauchy sequence. Therefore y_n is also convergent, convergent. Okay? So that is what proving, is using this only, we are proving. Okay?

(Refer Slide Time: 11:16)

Ex Show that $\sum_{n=1}^{\infty} \frac{n^n}{n!}$ can not converge.

Here $a_n = \frac{n^n}{n!} > 0$

$\lim_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \frac{n \cdot n \cdot n \dots n}{1 \cdot 2 \cdot 3 \dots n} > 1$

$\therefore \lim_{n \rightarrow \infty} a_n \neq 0$

Hence the series $\sum_{n=1}^{\infty} \frac{n^n}{n!}$ is Divergent

(Result: If a series of +ive terms, n^{th} term $\nrightarrow 0$ as $n \rightarrow \infty$, then the series will be Divergent.)

Next exercise, we see. So that, Sigma n is, 1 to infinity, n to the power n, divided by factorial n, cannot converge, cannot converge. Now these are the terms, of positive terms. Series of positive terms and if a series is convergent, then any term must go to zero. But if all the terms of the series are positive and limit of the N th term n, does not go to 0, then series has to be divergent. So here a n is, n to the power n, by factorial n, these are all terms are positive. And the limit of an, as n tends to infinity, this will be what? This is basically, limit of this, as n tends to infinity, n into n, into n, up to 1, divided by 1 2 3 and then. So this is, n by n is greater than 1, n by 2 is greater than 1, and by 3 is greater than 1. So basically this limit will always be greater than 1. Whatsoever the n, may be, Therefore, if the limit of this, does not tends to 0, as n tends to infinity, is not equal to 0, well the all the terms. Hence the series Sigma of this thing, n to the power factorial 1 to infinity, diverges, divergent, divergent. Yeah? Because of the, we are using this Result, a series of positive terms. If in a series of positive, if in a series of positive terms, the n th term, does not go to 0, as n tends to infinity, then the series will be divergent. So this is our. Okay? So using this, we can go for this.

(Refer Slide Time: 14:25)

Ex 24 Show that the sequence $\{x_n\}$ defined by

$$x_n = \int_1^n \frac{\cos t}{t^2} dt \text{ is Cauchy.}$$

Sol Let $m > n$, then

$$|x_m - x_n| = \left| \int_1^m \frac{\cos t}{t^2} dt - \int_1^n \frac{\cos t}{t^2} dt \right|$$

$$= \left| \int_n^m \frac{\cos t}{t^2} dt \right| \leq \int_n^m \frac{|\cos t|}{t^2} dt$$

$$\leq \int_n^m \frac{1}{t^2} dt = \left[-\frac{1}{t} \right]_n^m = -\frac{1}{m} + \frac{1}{n}$$

$$< \frac{1}{n},$$

Since $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$, for ϵ

Next is, show that, the sequence x_n , defined by, x_n is equal to 0 to n , $\cos T$, divided by T Square, DT is Cauchy. So let us suppose, M is greater than suppose N , is greater than n then mode of x_M , minus x_n . This is equal to mode, this is 1 2, sorry, this is 1 2 n . Because our T equal to 0, the function will not be defined, so 1 to M , so 1 to M . Cosine T over T Square, DT , minus 1 to n , cosine T , over T Square, DT . And that will be equal to modulus, n to M , n to M , cosine T , over T Square, DT . But this is less than equal to, integral, n to M , mode of cosine T , by T Square, DT . But cosine is bounded and bounded by 1? So it is less than equal to, integral, n to M , DT by, T Square, and this integral. The value will be minus 1 by T , and then, within the limit n to M , so this comes out to be minus 1 by M , plus 1 by n . Which is strictly less than 1 by n , and this is negative side. So, as n tends to infinity, but since, limit of this 1 by n , as n tends to infinity 0, then,

(Refer Slide Time: 16:37)

$$\begin{aligned}
 |x_m - x_n| &= \left| \int_1^m \frac{\cos t}{t^2} dt - \int_1^n \frac{\cos t}{t^2} dt \right| \\
 &= \left| \int_n^m \frac{\cos t}{t^2} dt \right| \leq \int_n^m \frac{|\cos t|}{t^2} dt \\
 &\leq \int_n^m \frac{dt}{t^2} = \left[-\frac{1}{t} \right]_n^m = -\frac{1}{m} + \frac{1}{n} \\
 &< \frac{1}{n},
 \end{aligned}$$

Since $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$, for every $\epsilon > 0$, $\exists n_0(\epsilon)$ s.t. for any $n > n_0$ we have $|x_m - x_n| < \frac{1}{n} < \epsilon$.
 $\therefore \{x_n\}$ is a Cauchy sequence

so for every epsilon greater than 0, there exist an N naught, N naught, depending on this epsilon, such that, so that, for, for any number, for any N, greater than equal to, N naught, we have, we have, mode of X mn minus X n, which is less than 1 by n, less than epsilon, and this is true, for all t.

Therefore the sequence x_n , is a Cauchy Sequence, Cauchy sequence. Okay? So this is so. Because, the right hand side is less than epsilon, therefore this will go to. Okay.

(Refer Slide Time: 17:53)

Ex 3 Let $\{x_n\}$ be a sequence such that there exists $A > 0$ and $C \in (0, 1)$ for which $|x_{n+1} - x_n| \leq A C^n$ for any $n \geq 1$. Show that $\{x_n\}$ is Cauchy.

Sol. Let $m > n$, consider

$$\begin{aligned}
 |x_m - x_n| &\leq |x_m - x_{m-1}| + \dots + |x_{n+1} - x_n| \\
 &\leq A C^{m-1} + A C^{m-2} + \dots + A C^n \\
 &= A C^n [1 + C + C^2 + \dots + C^{m-n}] \\
 &= A C^n \frac{1 - C^{m-n}}{(1 - C)} < \frac{A}{1 - C} \cdot C^n
 \end{aligned}$$

Since $0 < C < 1 \Rightarrow \lim_{n \rightarrow \infty} C^n = 0$. Hence for given $\epsilon > 0$, \exists

The next exercise; Let x_n be a sequence, sequence, such that, such that, there exist, there exist, a, greater than zero, and C, and C belongs to 0 1, for which, for which mode of x_{n+1} , minus x_n , is less than or equal to, a into C to the power n, for any n, greater than equal to 1. Then show that, show that, x_n is Cauchy, x_n is cauchy. Okay? So let us see the solution for it. Suppose M is greater than 1? M is greater than n? Consider mode of X M minus X n. This is less than equal to mode XM, minus XM minus 1, plus mode of plus term, x_{n+1} , minus x_n , this term we are lighting. Now each one, use this result. So this is less than equal to, AC, m minus 1, AC, M minus 2, and so on. And last term

is, AC^n . So take AC^n common. So, when you take AC^n common, you are getting, 1 plus, 1 plus, C plus C square, up to C, M minus n plus 1, now this is a geometric series. And the sum will be, 1 minus, C to the power M minus n , divided by, 1 minus c . So this will be strictly less than for th, a over 1 minus C , into C to the power n , Now, C , lying between $1, 0$ and 1 , because it is given. C belongs to $0, 1$, So C , lies between $0, 1$. Therefore, this implies that limit of C^n , as n tends to infinity, is 0 . Hence for given epsilon, greater than given epsilon, greater than 0 ,

(Refer Slide Time: 20:46)

Let $n > N$, consider

$$|x_m - x_n| \leq |x_m - x_{m-1}| + \dots + |x_{n+1} - x_n|$$

$$\leq A c^{m-1} + A c^{m-2} + \dots + A c^n$$

$$= A c^n [1 + c + c^2 + \dots + c^{m-n+1}]$$

$$= A c^n \frac{1 - c^{m-n+1}}{(1 - c)} < \frac{A}{1 - c} \cdot c^n$$

Since $0 < c < 1 \Rightarrow \lim_{n \rightarrow \infty} c^n = 0$. Hence for given $\epsilon > 0$, \exists

No st

$$|c^n - 0| < \epsilon \quad \forall n > N_0$$

$$\Rightarrow |x_m - x_n| < \epsilon \quad \forall m, n > N_0$$

$\Rightarrow \{x_n\}$ is a Cauchy Sequence.

there exists a capital N naught, such that, modulus of C^n , minus 0 , is less than epsilon, for all N greater than equal to n naught. Therefore this sequence X_M minus x_n , is less than epsilon, for all MN greater than equal to N . And this shows the sequence x_n is a Cauchy sequence, Cauchy sequence, for that. Okay? So this will be our cauchy sequence.

(Refer Slide Time: 21:38)

Ex 6 Show that the sequence $\left(n + \frac{(-1)^n}{n}\right)$ is not a Cauchy sequence. (7)

Sol $\epsilon = \frac{1}{3}$, $m = n+1$

$$|x_m - x_n| = \left| n+1 + \frac{(-1)^{n+1}}{n+1} - n - \frac{(-1)^n}{n} \right|$$

$$= \left| 1 + (-1)^{n+1} \left(\frac{1}{n+1} + \frac{1}{n} \right) \right|$$

when n is even

$$|x_m - x_n| \geq \left| 1 - \left(\frac{1}{n+1} + \frac{1}{n} \right) \right| \geq \left| 1 - \left(\frac{1}{1+1} + 1 \right) \right|$$

$$\geq \left| 1 - \frac{3}{2} \right| = \frac{1}{2}$$

when n is odd

$$|x_m - x_n| = \left| 1 + \frac{1}{n+1} + \frac{1}{n} \right| > 1$$

$\therefore \{x_n\}$ is not a Cauchy sequence

Exercise six; So that the sequence, the Sequence, n plus, minus 1, to the power n , divided by n , is not a Cauchy sequence. So let us start with say, epsilon is $1/3$. If I prove that difference x_{m} minus x_n , is greater than $1/3$, then it will not be cauchy sequence. So let M is suppose n , plus 1. Then what will be the x_m minus x_n ? This is equal to n plus 1, plus minus 1 to the power n , plus 1 divided by n , plus 1 minus, n minus 1, to the power n by N . And that gives you 1 plus, minus 1 to the power n plus 1, 1 by n plus 1, plus 1 by n . Now take the two cases. Ehen n is even and when n is odd. So when n is even, you are getting, when n is even, what we are getting is, x_m minus x_n , is nothing but, greater than equal to, all is equal to, 1 minus, 1 over n plus 1, plus 1 by n , which is greater than equal to 1 minus, 1 over 1 plus 1, plus 1. Because this will be, n plus 1, is n is greater than 1, so 1 by s this, less than what with minus sign, again it is greater than. So this shows, this is greater than equal to 1 minus, 3 by 2 , which is $1/2$. So this part is. And when n is odd, then x_n , x_m , minus x_n , will be equal to 1 plus, 1 by n plus 1, plus 1 by n Which is, obviously greater than, 1 . So in any case this difference is not less than $1/3$. Therefore the sequence x_n , is not a Cauchy sequence, it is not a cauchy sequence. Okay?

(Refer Slide Time: 24:32)

Ex 7. If $u_n > 0$ and $\sum_1^{\infty} u_n$ is convergent with sum S , then prove that $\frac{u_n}{u_1 + u_2 + \dots + u_n} < \frac{2u_n}{S}$, where n is sufficiently large

Pf Since $\sum_1^{\infty} u_n$ is convergent with sum S , so for given $\epsilon > 0$, \exists a +ive integer m s.t. $|s_n - S| < \epsilon$ for $n \geq m$ where $S = u_1 + u_2 + \dots + u_n$.

So, next question is. Say if n is, greater than 0 and $\sum u_n$, is convergent, with some s , with some s , then prove that, $\frac{u_n}{s_1 + u_1 + \dots + u_n}$, is strictly less than, 2 times of u_n , by s . See the proof of it. Where N is sufficiently large, where, N is sufficiently large, sufficiently large quantity, N sufficiently large quantity.

So solution is. Now since $\sum u_n$, is convergent, is convergent, $\sum u_n$ is convergent, with this sum, s . So for given epsilon, so for given Epsilon, greater than 0, there exists a positive integer m , integer m , such that the difference between S_N and sum s , is less than epsilon, for all N , greater than equal to capital M , Where s_n , means, the sum of the first n terms, of the sequence.

(Refer Slide Time: 26:29)

Since $\sum u_n$ is convergent, for given $\epsilon > 0$, \exists a +ive integer m s.t. $|s_n - s| < \epsilon$ for $n \geq m$ where $s_1 = u_1 + u_2 + \dots + u_n$.

\Rightarrow particular, $\epsilon = \frac{1}{2}s > 0$, $s - \epsilon < s_n < s + \epsilon$

$\Rightarrow \frac{1}{2}s < s_n < \frac{3}{2}s, \forall n \geq m$

$\Rightarrow \frac{2}{s} > \frac{1}{s_n} > \frac{2}{3s}$

$\Rightarrow \frac{u_n}{s_n} < \frac{2u_n}{s} \Rightarrow \frac{u_n}{u_1 + u_2 + \dots + u_n} < \frac{2u_n}{s} \quad \square$

So this implies that, S_N lies between, s plus epsilon, and s minus epsilon and in particular, if we take epsilon to be $\frac{1}{2}$, then what we get? Half of s , Sorry, Epsilon is half of s , which is positive, which is positive. Then half of s , is less than s , M , is less than, 3 by 2 s . And this is true for every N , greater than equal to M . So this implies that, $2YS$, is greater than 1 by s_n , is greater than 2 by 3 s , 3 s . NSD but s in, this one, u_n by is, so 2 by s is greater than this. And therefore what we get from here is, can we say u_n , over S_N , is less than 2 by s ? Multiply this. Okay? Multiply by UN , here, UN here. So u_n , by S_N , is less than 2 by UN and s_n . And this shows, this implies, that U_n , over s Me, S_N means, S_1, u_1, u_1 , plus u_2 , plus u_n . This is strictly less than, 2 times of U_n , by s . And that is what we wanted to show. Is it okay? So this comes.

Thank you.
