**Lecture – 56**  
**Example of Mellin Transform – I**

So, in the last lecture, we started the Mellin transform. After doing the Laplace and Fourier transform we give the definition of Mellin transform. We have shown how to find out the Mellin transform of some simple function, and we started the properties, the scaling properties, differential property and all these things we have done. Today also we will start with the some more properties.

(Refer Slide Time: 00:48)

(ix) **Mellin transform of integrals:**

$$M \left[ \int_0^x f(t) dt \right] = -\frac{1}{s} \bar{F}(s+1)$$

**Proof:**

Let  $\phi(x) = \int_0^x f(t) dt$   
so that  $\phi'(x) = f(x)$  with  $\phi(0) = 0$

The first property is on Mellin transform of integrals that is Mellin transform of 0 to x f t dt, this is equals to minus 1 by s F bar s plus 1.

(Refer Slide Time: 01:04)

$$M \left[ \int_0^x f(t) dt \right] = -\frac{1}{s} \bar{F}(s+1)$$

$$\text{Let } \phi(x) = \int_0^x f(t) dt$$

$$\phi'(x) = f(x) \text{ with } \phi(0) = 0$$

$$M[f(x)] = M[\phi'(x), s]$$

$$= -(s-1) M \left[ \int_0^x f(t) dt, s-1 \right],$$

Prop (vi)

To give the proof of this one we have to start say, so basically you have to prove Mellin transform of  $\int_0^x f(t) dt$ , this is equals to  $-\frac{1}{s} \bar{F}(s+1)$ . To prove this one, let us start with say let  $\phi(x) = \int_0^x f(t) dt$ . So, once you are writing  $\phi(x) = \int_0^x f(t) dt$ , so that automatically whenever you will find out the  $\phi'(x)$  that is the differentiation with respect to integration, this will be equals to  $f(x)$  with your  $\phi(0) = 0$ , this is equals to 0.

So, we are assuming  $\phi(x) = \int_0^x f(t) dt$ , where your if I take the differentiation with respect to  $x$ , then  $\phi'(x)$  will be equals to  $f(x)$  where your  $\phi(0)$  is equals to 0. So, that now you can write down Mellin transform of  $f(x)$  you know it, this is equals to Mellin transform of  $f(x)$  is nothing but  $\phi'(x)$ . So, Mellin transform of  $\phi'(x)$  where the variable is  $s$ . So, you are writing Mellin transform of  $f(x)$ , this is equals Mellin transform of  $\phi'(x)$  and this is equals to  $s$ .

This equals you can write down  $-\frac{1}{s-1}$  into Mellin transform of  $\int_0^x f(t) dt$ , but the variable will be  $s-1$ , this we are getting from the property 6, please note one; note this one. From property 6, directly we can write down Mellin transform of  $\phi'(x)$  this is equals  $-\frac{1}{s-1}$  Mellin transform of  $\int_0^x f(t) dt$ , where the variable is  $s-1$ . So, basically the derivative property that is property 6, we can obtain this one. So, once I am writing this Mellin transform of  $f(x)$  equals  $-\frac{1}{s-1}$  and Mellin transform of  $\int_0^x f(t) dt$ , the variable is  $s-1$ .

(Refer Slide Time: 03:37)

$$\begin{aligned} \Rightarrow M\left[\int_0^x f(t) dt, s\right] \\ = -\frac{1}{s} M[f(x), s+1], \quad \text{by } s+1 \\ = -\frac{1}{s} \bar{F}(s+1) \end{aligned}$$

So, from here you can write down Mellin transform of  $\int_0^x f(t) dt$ , where the variable is equals to  $s$ . This is equals minus  $s$  Mellin transform of  $f(x) s+1$ . What we are doing here basically we are replacing  $s$  by  $s+1$ . In the earlier one, you are replacing  $s$  by  $s+1$ . And if you replace  $s$  by  $s+1$ , then you will obtain Mellin transform of  $\int_0^x f(t) dt$  variable is  $ds$  equals minus  $s$  Mellin transform of  $f(x) s+1$ . And this is nothing but minus  $1$  by  $s$  Mellin transform of  $f(x) s+1$ , this you can write down  $\bar{F}(s+1)$ . So, therefore, Mellin transform of  $\int_0^x f(t) dt$  is equals minus  $s$   $\bar{F}(s+1)$  which completes the proof of this one

So, just let us quickly see this one. So, we are assuming that the  $\phi(x)$  equals  $\int_0^x f(t) dt$ , so that always you can write down  $\phi'(x)$  this is equals  $f(x)$ , where your  $\phi(0)$  is equals to  $0$  from the integral itself you can find out.

(Refer Slide Time: 05:07)

$$\begin{aligned}M[f(x)] &= M[\phi'(x), s] \\ &= -(s-1)M\left[\int_0^x f(t) dt, s-1\right] \quad [\text{by (vi)}] \\ \Rightarrow M\left[\int_0^x f(t) dt, s\right] &= -\frac{1}{s}M[f(x), s+1] \quad [\text{Replacing } s \text{ by } s+1] \\ &= -\frac{1}{s}\bar{F}(s+1)\end{aligned}$$

The slide also features a small video inset of a man in a white shirt and glasses in the bottom right corner. The footer includes the 'swayam' logo and the text 'THE ONLINE EDUCATION'.

So, that Mellin transform of  $f(x)$  equals Mellin transform of  $\phi'(x)$  with the parameter as  $s$ , this is equal to using the property (vi) that is the derivative property which we have done earlier. Using that property you can write down this equals minus  $s-1$  into Mellin transform of  $\int_0^x f(t) dt$ , where the parameter is  $s-1$ . And this is again from here you can write down Mellin transform of  $\int_0^x f(t) dt$  with the parameter as  $s$  equals minus  $1$  by  $s$  Mellin transform of  $f(x)$  with the parameter is  $s+1$ , so that directly you can write down minus  $1$  by  $s$  into the Mellin transform of  $s+1$  that is  $\bar{F}(s+1)$  Mellin transform of  $f(x)$  over parameter  $s+1$  which is nothing but  $\bar{F}(s+1)$  which completes the proof of this.

(Refer Slide Time: 06:08)

(x) **Convolution theorem:**

If  $M[f(x)] = \bar{F}(s)$  and  $M[g(x)] = \bar{G}(s)$

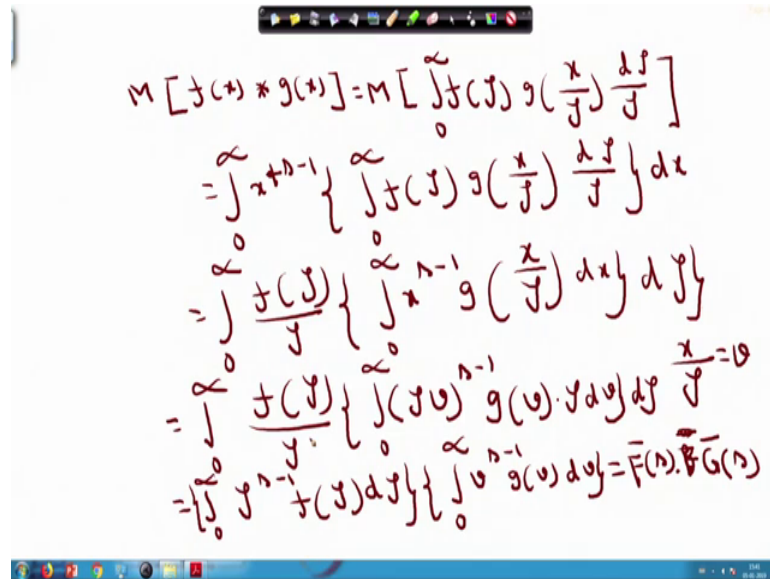

then  $M[f(x) * g(x)] = M \left[ \int_0^{\infty} f(\zeta) g\left(\frac{x}{\zeta}\right) \frac{d\zeta}{\zeta} \right] = \bar{F}(s)\bar{G}(s)$

$M[f(x) \circ g(x)] = M \left[ \int_0^{\infty} f(x\zeta)g(\zeta) d\zeta \right] = \bar{F}(s)\bar{G}(1-s)$

The next one is the convolution theorem. If the Mellin transform of  $f(x)$  is  $\bar{F}(s)$  and Mellin transform of  $g(x)$  is  $\bar{G}(s)$  because as you know for the convolution which we have done it for the Laplace transform, for the Fourier transform. We require two functions  $f(x)$  and  $g(x)$ , so we are assuming Mellin transform of  $f(x)$  is  $\bar{F}(s)$  and Mellin transform of  $g(x)$  is  $\bar{G}(s)$ . Then two ways we can define it Mellin transform of  $f(x) \circ g(x)$  operator is star operator  $g(x)$  equals Mellin transform of  $\int_0^{\infty} f(\eta)g(x/\eta) d\eta/\eta$  this equals as earlier we have seen equals  $\bar{F}(s)\bar{G}(s)$  or in other sense the Mellin transform of  $f(x)$  into multiplied by Mellin transform of  $g(x)$ .

Or you can write down in this way also Mellin transform of  $f(x) \circ g(x)$ , this equals we can define it in the form of Mellin transform of  $\int_0^{\infty} f(x\eta)g(\eta) d\eta$  this equals it will be  $\bar{F}(s)\bar{G}(1-s)$ . So, this is the theorem, convolution theorem.

(Refer Slide Time: 07:30)

$$\begin{aligned}
 M[f(x) * g(x)] &= M\left[\int_0^{\infty} f(\xi) g\left(\frac{x}{\xi}\right) \frac{d\xi}{\xi}\right] \\
 &= \int_0^{\infty} x^{s-1} \left\{ \int_0^{\infty} f(\xi) g\left(\frac{x}{\xi}\right) \frac{d\xi}{\xi} \right\} dx \\
 &= \int_0^{\infty} \frac{f(\xi)}{\xi} \left\{ \int_0^{\infty} x^{s-1} g\left(\frac{x}{\xi}\right) dx \right\} d\xi \\
 &= \int_0^{\infty} \frac{f(\xi)}{\xi} \left\{ \int_0^{\infty} (\xi v)^{s-1} g(v) \xi dv \right\} d\xi \quad \frac{x}{\xi} = v \\
 &= \int_0^{\infty} \xi^{s-1} f(\xi) d\xi \int_0^{\infty} v^{s-1} g(v) dv = \bar{F}(s) \cdot \bar{G}(s)
 \end{aligned}$$

Let us see the proof of this particular theorem. The first one is Mellin transform of  $f * g$ . So, Mellin transform of  $f * g$  from the definition, you can write down  $\int_0^{\infty} \int_0^{\infty} f(\xi) g\left(\frac{x}{\xi}\right) \frac{d\xi}{\xi} dx$ . And this is equal to if I just put it here, the definition of Mellin transform, so that you will obtain  $x$  to the power  $s$ , sorry this is  $x$  to the power plus  $s$  minus 1 into your this integral will come that is  $\int_0^{\infty} \int_0^{\infty} f(\xi) g\left(\frac{x}{\xi}\right) \frac{d\xi}{\xi} dx$  will come.

So, if I change the order of the integration that is  $dx$  and  $d\xi$ , if I just change the order of this integration, I will obtain as  $\int_0^{\infty} \int_0^{\infty} f(\xi) g\left(\frac{x}{\xi}\right) \frac{d\xi}{\xi} dx$ . So, here if you substitute  $dx$ , if you substitute  $x$  by  $\xi v$ , this is equal say  $v$ . If I substitute  $x$  by  $\xi v$ , this is equal to  $v$ , then you will obtain  $\int_0^{\infty} \int_0^{\infty} \xi^{s-1} f(\xi) g(v) \xi dv d\xi$ . So, your  $x$  is the  $\xi v$ . So, therefore, it will be  $\int_0^{\infty} \int_0^{\infty} \xi^{s-1} f(\xi) g(v) \xi dv d\xi$ ;  $d\xi$  will come.

So, this equals now I can break them two independent integrals as  $\int_0^{\infty} \int_0^{\infty} \xi^{s-1} f(\xi) g(v) \xi dv d\xi$ , this is one integral independently I can break it. And the other one will be  $\int_0^{\infty} \int_0^{\infty} v^{s-1} g(v) dv d\xi$ . So, you are getting these two integrals, one is  $\int_0^{\infty} \xi^{s-1} f(\xi) d\xi$  and the other is  $\int_0^{\infty} v^{s-1} g(v) dv$ .

the power  $s$  minus 1  $f(\eta) d\eta$  which is nothing but capital  $F$  bar is that is the Mellin transform of  $f(x)$ .

And the next integral  $0$  to infinity  $v$  to the power  $s$  minus 1  $g(v) dv$ , this is nothing but the Mellin transform of the  $g(x)$  sorry this, so it will be  $F$  bar  $\eta$  into  $G$  bar  $s$ . So, we are obtaining the proof of this one as Mellin transform of  $f(x) * g(x)$  this is equals  $F$  bar  $s$  into  $G$  bar  $s$ . So, I hope the proof is clear. Let us just see it once in the first part of the proof, because it has two parts.

(Refer Slide Time: 11:16)

**Proof:**

$$\begin{aligned}
 M[f(x) * g(x)] &= M \left[ \int_0^\infty f(\zeta) g\left(\frac{x}{\zeta}\right) \frac{d\zeta}{\zeta} \right] \\
 &= \int_0^\infty x^{s-1} \left\{ \int_0^\infty f(\zeta) g\left(\frac{x}{\zeta}\right) \frac{d\zeta}{\zeta} \right\} dx \\
 &= \int_0^\infty \frac{f(\zeta)}{\zeta} \left\{ \int_0^\infty x^{s-1} g\left(\frac{x}{\zeta}\right) dx \right\} d\zeta \\
 &= \int_0^\infty \frac{f(\zeta)}{\zeta} \left\{ \int_0^\infty (\zeta v)^{s-1} g(v) \zeta dv \right\} d\zeta \quad \left[ \text{put } \frac{x}{\zeta} = v \right] \\
 &= \left\{ \int_0^\infty \zeta^{s-1} f(\zeta) d\zeta \right\} \left\{ \int_0^\infty v^{s-1} g(v) dv \right\} \\
 &= \bar{F}(s) \bar{G}(s)
 \end{aligned}$$

We have shown the first part of the proof we are starting from Mellin transform of  $f(x)$  convolution  $g(x)$ , this is equals from the definition you are writing. Mellin transform of  $0$  to infinity  $f(\eta) d\eta$  into  $g(x)$  by  $\eta d\eta$  by  $\eta$ . Now, from the property definition of Mellin transform, this you can write as  $0$  to infinity  $x$  to the power  $s$  minus 1  $0$  to infinity  $f(\eta) g(x)$  by  $\eta d\eta$  by  $\eta$  into  $dx$ . Now, if I substitute over here  $x$  by  $\eta$  equals  $x$  by  $\eta$  equals  $v$ , then first I am changing the order of the integration that is  $d\eta$  and  $dx$ , and I am getting the third line.

From the third line, if I substitute  $x$  by  $\eta$  equals  $v$ , I will obtain  $0$  to infinity  $f(\eta)$  by  $\eta$   $0$  to infinity  $\eta v$  to the power  $s$  minus 1  $g(v) \eta dv$  into  $d\eta$ . So that now, the way to variables independently I can write down  $v$  and  $\eta$ , this two I can write down independently. What we have written in the last line that is  $0$  to infinity  $\eta$  to the power  $s$  minus 1  $f(\eta) d\eta$  into  $0$  to infinity  $v$  to the power  $s$  minus 1  $g(v) dv$ . This by this

substitution  $x$  by  $\eta$  equals  $v$ , I am simply independently I am making these two parameters as independent under the integrations, so that the first integral  $0$  to infinity  $\eta$  to the power  $s$  minus  $1$   $f(\eta) d\eta$  is nothing but  $\bar{F}(s)$  and the second integral  $0$  to infinity  $v$  to the power  $s$  minus  $1$   $g(b) db$  from the definition of Mellin transform it is  $\bar{G}(s)$ . So, that the first from the according to the first convolution property we have proved that Mellin transform of  $f(x)$  convolution  $g(x)$  is equals to  $\bar{F}(s)$  into  $\bar{G}(s)$ .

(Refer Slide Time: 13:24)

$$\begin{aligned}
 M[f(x) * g(x)] &= M\left[\int_0^{\infty} f(x\eta)g(\eta) d\eta\right] \\
 &= \int_0^{\infty} x^{s-1} \left[\int_0^{\infty} f(x\eta)g(\eta) d\eta\right] dx \quad x = v\eta \\
 &= \int_0^{\infty} v^{s-1} \left\{ \int_0^{\infty} \frac{f(v)g(\eta)}{v^{s-1}} d\eta \right\} \frac{dv}{v} \\
 &= \left\{ \int_0^{\infty} v^{(s-1)-1} g(\eta) d\eta \right\} \left\{ \int_0^{\infty} v^{s-1} f(v) dv \right\} \\
 &= \bar{G}(s-1) \cdot \bar{F}(s)
 \end{aligned}$$

Now, let us see the next property that is using the next property how to prove this one. So, we have used two different convolution operators because the definitions we have used, two different definitions, anyone can use any one of these two. So, that now Mellin transform of  $f(x)$  convolution  $g(x)$ , this equals you can write down Mellin transform of  $0$  to infinity here it is  $f(x)$   $\eta$  the definition has changed into  $g(\eta)$  into  $d\eta$ .

Now, again as usual from the last one what we have done that is from the definition of Mellin transform this equals you can write down  $0$  to infinity  $x$  to the power  $s$  minus  $1$   $0$  to infinity  $f(x)$   $\eta$   $g(\eta)$  into  $d\eta$  and  $dx$  will come here. So, that again if you put  $x$   $\eta$  equals  $v$  just like we have done earlier, here you substitute  $x$   $\eta$  equals  $v$ , the other case the substitution was other one  $x$  by  $\eta$  equals  $v$ .

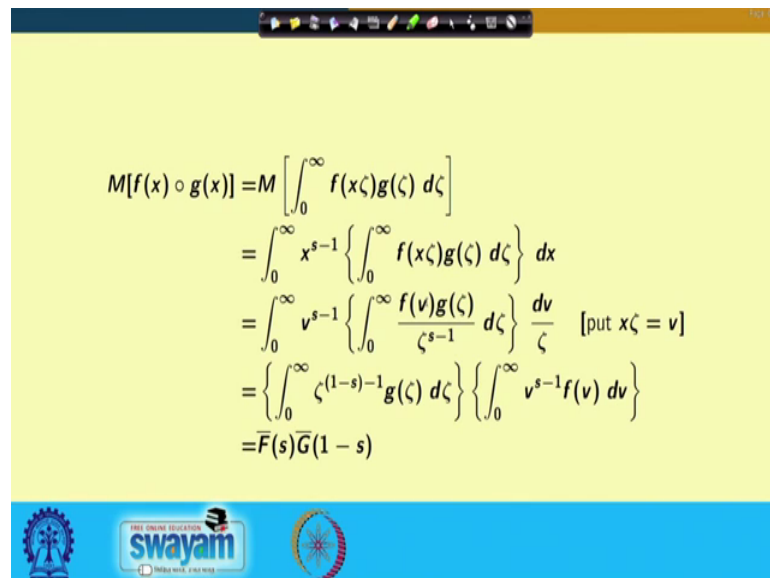

So, if I substitute this, this will be equals to  $0$  to infinity  $v$  to the power  $s$  minus  $1$  into  $0$  to infinity  $f(v)$  into  $g(\eta)$  will be there divided by  $\eta$  to the power  $s$  minus  $1$   $d\eta$  into  $dv$  by  $\eta$ .

So, once I am writing this, this again now I can break it into two independent integrals, because the independent parameters  $v$  and  $\eta$  I can separate it out and I can put it in two different integrals in the form of like this. One will be 0 to infinity  $\eta$  to the power  $1 - s$  into  $g(\eta) d\eta$ ,  $\eta$  to the power  $1 - s$  is there. So, I am writing this and by  $\eta$  is there and the other integral will be 0 to infinity  $v$  to the power  $s - 1$  into function of  $v$  into  $dv$ .

So, now using this integral I am separating it out and I am getting two different integrals, so that the first one is nothing but this integral or let me write down the first one. The first integral 0 to infinity  $\eta$  to the power  $1 - s$  into  $g(\eta) d\eta$ , this is nothing but  $\bar{G}(1 - s)$  that is the Mellin transform of  $G$  with respect to the parameter  $1 - s$  and the second integral is equals to  $\bar{F}(s)$  that is this is the value of the parameter here.  $\bar{F}(s)$  is nothing but the Mellin transform of the function  $f(x)$  with respect to the parameter  $s$ . And this completes the proof that Mellin transform of  $f(x) \circledast g(x)$  with respect to the definition that the definition of 0 to infinity  $f(x) \eta$  into  $g(\eta) d\eta$ , this equals  $\bar{F}(s) \bar{G}(1 - s)$ . Let us see it once more here.

(Refer Slide Time: 17:07)

$$\begin{aligned}
 M[f(x) \circledast g(x)] &= M \left[ \int_0^\infty f(x\zeta)g(\zeta) d\zeta \right] \\
 &= \int_0^\infty x^{s-1} \left\{ \int_0^\infty f(x\zeta)g(\zeta) d\zeta \right\} dx \\
 &= \int_0^\infty v^{s-1} \left\{ \int_0^\infty \frac{f(v)g(\zeta)}{\zeta^{s-1}} d\zeta \right\} \frac{dv}{\zeta} \quad [\text{put } x\zeta = v] \\
 &= \left\{ \int_0^\infty \zeta^{(1-s)-1} g(\zeta) d\zeta \right\} \left\{ \int_0^\infty v^{s-1} f(v) dv \right\} \\
 &= \bar{F}(s) \bar{G}(1 - s)
 \end{aligned}$$

So, this we did it for the earlier case. Now, for the second one, we are starting with Mellin transform of  $f(x) \circledast g(x)$  equals Mellin transform of the definition has changed little bit of convolution, I can use any one of these two definitions. So, using this definition 0 to infinity  $f(x) \eta$  into  $g(\eta) d\eta$ . Now from the definition of Mellin

transform this equals, I can write down 0 to infinity x to the power s minus 1 into 0 to infinity f of x eta g eta d eta into dx. Using the substitution x eta equals v, please note that in the earlier case we use the substitution x by eta this is equals v. So, this equals 0 to infinity v to the power s minus 1 into 0 to infinity f v g eta by eta to the power s minus 1 d eta into dv by eta.

Now, I can separate the two independent variables v and eta separately and I can put them in two different integrals like this, 0 to infinity eta to the power 1 minus s minus 1 into g eta d eta into 0 to infinity v to the power s minus 1 f v into d v. So that the first integral is nothing but G bar into 1 minus s that is the first integral means 0 to infinity eta to the power 1 minus s minus 1 into g eta d eta is G bar 1 minus s. Whereas, the second integral 0 to infinity v to the power s minus 1 into f v dv is nothing but F bar s, so that the Mellin transform of convolution of two functions f x and g x equals the F bar s into G bar 1 minus s.

(Refer Slide Time: 19:03)

Handwritten derivation for the Mellin transform of  $e^{-ax^2}$ :

$$\begin{aligned} \text{EX. } M[e^{-ax^2}], a > 0 \\ M[e^{-ax^2}] &= \int_0^{\infty} x^{s-1} e^{-ax^2} dx, & \text{Let } ax^2 = u \\ & & x = \sqrt{\frac{u}{a}} \\ & & dx = \frac{1}{2\sqrt{au}} du \\ & & \begin{array}{l} x|0 \rightarrow \infty \\ u|0 \rightarrow \infty \end{array} \\ &= \int_0^{\infty} \left(\frac{u}{a}\right)^{\frac{s-1}{2}} e^{-u} \cdot \frac{1}{2\sqrt{au}} du \\ &= \frac{1}{2 \cdot a^{\frac{s-1}{2}} \cdot a^{1/2}} \int_0^{\infty} u^{\frac{s-1}{2} - \frac{1}{2}} e^{-u} du \\ &= \frac{1}{2} \cdot a^{-s/2} \int_0^{\infty} u^{\frac{s}{2} - 1} e^{-u} du = \frac{1}{2} a^{-s/2} \Gamma\left(\frac{s}{2}\right) \end{aligned}$$

Now, using these properties, let us see; let us solve some example, so that you can understand it easily how actually they work. The first example is like this. We want to find out the Mellin transform of e power minus a x square, where it is given that a is greater than 0. So, just we have done it for the other transform; let us first find out the Mellin transform of some different type of functions. So, first one we are taking as Mellin transform of e power minus a x squared, so that the Mellin transform of e power

minus  $a x^2$ , this is equals from definition you can write down 0 to infinity  $x$  to the power  $s - 1$  into  $e^{-a x^2}$  function is this into  $dx$ .

Now, let us substitute here say  $a x^2 = u$ . So, that your  $x$  will be equals to  $\sqrt{u/a}$ , we are taking the positive one. So,  $dx$  equals will be  $1/2 \sqrt{a} u^{-1/2} du$ . And whenever your  $x$  is 0, your  $u$  is 0; whenever  $x$  is infinity, your  $u$  is also infinity, so that the limit of integration will remain the same.

So, by substitution  $a x^2 = u$ , you can write down this integral as 0 to infinity limit will remain same,  $u$  by  $a$  to the power  $s - 1$  by two into  $e^{-u}$  power minus  $a x^2$ , so that sorry, this is  $e^{-u}$  power minus  $a x^2$  1 minus will come. So,  $e^{-u}$  into your  $dx$  is  $1/2 \sqrt{a} u^{-1/2} du$ .

So, by substituting  $a x^2 = u$ , where we are finding what is  $x$  is  $\sqrt{u/a}$  by  $a$   $dx$  you are getting limits if for changes of  $x$  what is happening on  $u$  that is the  $u$  limit of  $u$  remains the same 0 to infinity. So, this integral you are writing 0 to infinity  $u$  by  $a$  to the power  $s - 1$  by 2 into  $e^{-u}$  into  $dx$  is this quantity  $1/2 \sqrt{a} u^{-1/2} du$ . So, after simplification this equals you can write down  $1/2 \sqrt{a}$  you can bring outside  $a$  to the power  $s - 1$  by 2 into  $1/a$  is here  $a$  to the power half this  $a$  to the power half will be coming this is equals 0 to infinity. So,  $u$  power  $s - 1$  by 2 and minus half is there. So,  $u$  to the power  $s - 1$  by 2 minus this denominator  $u$  to the power half is there so, minus half into  $e^{-u}$  into  $du$ .

And once I am getting this, this equals you can write down 0 to infinity. So this equals before writing 0 to infinity, this will be equals to half into  $a$  to the power minus half plus half will be canceled, so that  $a$  to the power minus  $s/2$  only will come 0 to infinity  $u$  to the power this will be equals to  $s/2 - 1/2$ . So, and this is equals  $e^{-u}$  into  $du$ .

And if you see this integral 0 to infinity  $u$  to the power  $s - 1$  by 2 into  $2$  to the power minus 1 this I can express it in terms of gamma function directly, so that I can write down half into  $a$  to the power minus  $s/2$  and value of this integral  $u$  to the power  $s/2 - 1/2$  is there, so that it will be equals to  $\Gamma(s/2)$ .

So, therefore, the Mellin transform of  $x^a$  is nothing but  $\frac{1}{s+1}$  to the power  $s+1$  into  $\Gamma(s+1)$ . So, please note this one this result because afterwards also for certain other examples, we will use this particular result that Mellin transform of  $x^a$  equals  $\frac{1}{s+1}$  to the power  $s+1$  into  $\Gamma(s+1)$ . So, I hope it is clear.

(Refer Slide Time: 24:01)

EX.  $M[x^b H(x-a)]$ ;  $H(x-a) = 1, x > a$   
 $0, \text{ otherwise}$

$$M[H(x-a)] = \int_0^{\infty} x^{s-1} H(x-a) dx$$

$$= \int_0^a x^{s-1} \cdot 0 dx + \int_a^{\infty} x^{s-1} \cdot 1 dx = \int_a^{\infty} x^{s-1} dx$$

$$= \left[ \frac{x^{-(1-s)+1}}{-(1-s)+1} \right]_a^{\infty}, \text{ for } \text{Re}(s) < 0$$

$$= 0 - \frac{a^s}{s} = -\frac{a^s}{s} = \Gamma(s), \text{ say}$$

Let us go to the next example. We want to find out the Mellin transform of this thing  $x^b$  into  $H$  of  $x$  minus  $a$  say, where what is  $H$ , I hope you remember it,  $H$  is the Heaviside function which is defined as follows.  $H$  of  $x$  minus  $a$  this is equals to 1 for  $x$  greater than  $a$  and 0 otherwise. Sorry, if this is  $x$  minus  $a$ ,  $h$  of  $x$  minus  $a$ , so it will not be 0, but this will be  $H$  of  $x$  minus  $a$  equals 1 for  $x$  greater than  $a$  and 0 otherwise. This we have discussed earlier that Heaviside function. So, we want to find out the value or Mellin transform of the function  $x$  to the power  $B$  into the  $H$  of  $x$  minus  $a$ , where  $H$  of  $x$  minus  $a$  is nothing but the Heaviside function which is defined as  $H$  of  $x$  minus  $a$  equals to 1 for  $x$  greater than  $a$ , and it is 0 otherwise.

Now, let us start with this one, what is the Mellin transform of the Heaviside function that we want to find out first. So, Mellin transform of this Heaviside function this is equals to 0 to infinity  $x$  to the power  $s-1$  into  $h$  of  $x$  minus  $a$  into  $dx$ . So, as you know from this definition  $h$  of  $x$  minus  $a$  1 for  $x$  greater than  $a$  and 0 otherwise.

So, this I can break it into two limits 0 to a x to the power s minus 1 in 0 to a value of the Heaviside function is 0 into 0 dx plus a to infinity x to the power s minus 1 into the value of the Heaviside function in this case is 1. So, this is equals to 1 d s. So, that the first integral will vanish you will have only this integral a to infinity x to the power s minus 1 into dx.

And if you evaluate this integral, this will be equals to x to the power minus 1 minus s plus 1 divided by minus 1 plus s plus 1 and the limiting value is this a to infinity. Whenever you evaluate the upper limit, the value will be 0 and the lower limit will be a minus a to the power s by s. And we are assuming that the real part of s is less than 0. This is always true for convergence. So, please note that real part of s is less than 0 from convergence we have used this one. So, value of this integral is a to the minus a to the power s by s and this is equal say F bar s we are assuming that.

Therefore, Mellin transform of the Heaviside function or unit step function H of x by a, this is equals minus a to the power s by s. So, for doing one problem, we also evaluated what is the Mellin transform of Heaviside function also. And this we are getting as minus a to the power s by s which is equals to F bar s we are assuming.

(Refer Slide Time: 27:42)

The image shows a handwritten derivation on a whiteboard. At the top, there is a toolbar with various drawing tools. The main content consists of three lines of mathematical equations:

$$M[H(x-a)] = -\frac{a^n}{n} = \bar{F}(n)$$

$$M[x^b H(x-a)] = \bar{F}(n+b), \text{ shifting prop.}$$

$$= -\frac{a^{n+b}}{n+b}, \text{ RE}(n+b) < 0$$

At the bottom of the whiteboard, there is a Windows taskbar with several application icons and a system clock showing 10:10 AM on 10/10/2020.

Therefore, once I have this particular property that H of x minus a this is equals to minus a to the power s by s, this is equal say F bar s. Therefore, Mellin transform of x to the power b H of x minus b, H of x minus a, this directly we can write down F bar s plus x to

the power  $b$  is there  $s + b$ , please note that we have used here the shifting property; we have used here the shifting property.

If I know that the Mellin transform of the Heaviside function  $H$  of  $x - a$  is  $\frac{e^{-as}}{s}$  then Mellin transform of  $x$  to the power  $b$   $H$  of  $x - a$ , this directly we can write down using the shifting property as  $\frac{e^{-as}}{s + b}$ , so that I know what is  $\frac{e^{-as}}{s + b}$  is  $e^{-as}$  to the power  $s + b$  is divided by  $s + b$ . And this equals therefore, I can write down  $e^{-as}$  to the power  $s + b$  by  $s + b$ , so that  $s$  is replaced by  $s + b$ .

And please note that the real part of  $s + b$  should be less than  $0$ . So, therefore, Mellin transform of the function  $x$  to the power  $b$  into  $H$  of  $x - a$ , this is equals  $\frac{e^{-as}}{s + b}$ , where  $H$  of  $x - a$  is nothing but the Heaviside function. So, I hope you have understood how to find out the Mellin transform of sum functions. In the next class, we will go through some more examples, so that we can better understand how to find out the Mellin transform of some more well-known functions.
