**Lecture – 57**  
**Examples of Mellin Transform – II**

So, in continuation with the last lecture, let us start with some more examples on Mellin transform so that you can understand it in much better way. Last example what we did was Mellin transform of  $x$  to the power  $b$  into  $h$  of  $x$  minus  $a$ , where  $h$  of  $x$  minus  $a$  is nothing but the Heaviside function, you need to Heaviside function. Now, let us see some well known functions for which we need the Mellin transform and which is very useful in physics and other engineering branches whenever they try to solve some real life practical problems.

(Refer Slide Time: 01:01)

Ex -  $M[E(x)]$ ;  $E(x)$ : Exponential Integral Function

$$E(x) = \int_x^{\infty} \frac{e^{-t}}{t} dt$$

$$f(x) = E(x) = \int_x^{\infty} \frac{e^{-t}}{t} dt, \quad M[f(x)] = \bar{F}(s)$$

$$f'(x) = -\frac{e^{-x}}{x} \quad \text{Leibniz Integral Rule}$$

$$\underline{M[e^{-x}] = \Gamma(s)}; \quad M[e^{-ax}] = \frac{\Gamma(s)}{a^s}$$

So, the next example what we want to see is, we want to find out the Mellin transform of  $E$  of  $x$ , where your  $E$   $x$  basically is nothing but exponential integral function. This kind of functions appears very frequently and for that reason we are trying to find out the Mellin transform of this one, so exponential integral function. And this function is given by  $E$  of  $x$  this is equals to  $x$  to infinity  $e$  power minus  $t$  by  $t$  into  $dt$ . So, we want to find out the Mellin transform of  $E$  of  $x$ , where  $E$   $x$  is nothing but the exponential integral function and is given as  $E$  of  $x$  equals  $x$  to infinity  $e$  power minus  $t$  by  $dt$ .

So, the function is little bit peculiar, but this type of functions appears in real life in various problems. So, you have taken this type of examples, which are very frequently used so that directly you can use the Mellin transform of these particular functions. To find out the Mellin transform of this function, I am starting with say  $f(x)$ , this is equals the exponential integral function, and this is nothing but  $x$  to infinity  $e^{-t}$  by  $t$  into  $dt$ . And of course, if I take the Mellin transform of  $f(x)$ , this will be equals to  $\bar{F}(s)$  say.

So, now if I take  $f(x)$  equals this integral  $x$  to infinity  $e^{-t}$  by  $t$   $dt$   $f'(x)$  if I differentiate with respect to  $x$  on the both side on the given this thing, then this I can directly write down  $f'(x)$  equals minus  $e^{-x}$  by  $x$ . And this basically I am using here, I am just writing Leibniz integral rule. So, using Leibniz integral rule directly I am not specifying or in differentiation under the sign of integration  $f'(x)$  equals you can write down minus  $e^{-x}$  by  $x$  using the Leibniz integral rule.

And once I am writing this, therefore, so Mellin transform of  $e^{-x}$  is equals to  $\Gamma(s)$ . If you recall in the last lecture itself, we have done Mellin transform of  $e^{-ax}$  equals  $\Gamma(s)$  by  $a^s$ . So, from here this we have done in the last lecture itself Mellin transform of  $e^{-ax}$  is  $\Gamma(s)$  by  $a^s$  to the power  $x$ . From here you can write down Mellin transform of  $e^{-x}$ , this is equals to  $\Gamma(s)$ .

(Refer Slide Time: 04:23)

$$\begin{aligned}
 M[e^{-x}] &= \Gamma(s) & f'(x) &= \frac{e^{-x}}{-x} \\
 M[x^{-1}e^{-x}] &= \Gamma(s-1) \\
 M[f'(x)] &= -\Gamma(s-1) \\
 \Rightarrow -(s-1)\bar{F}(s-1) &= -\Gamma(s-1) & ; & M[f'(x)] = \\
 \Rightarrow \bar{F}(s-1) &= \frac{\Gamma(s-1)}{s-1} \\
 \Rightarrow \bar{F}(s) &= \frac{\Gamma(s)}{s^2}
 \end{aligned}$$

So, once I am getting this from here, you can write down, you have this one Mellin transform of  $e^{-x}$  is  $\Gamma(s)$  so that using shifting property now you can write down Mellin transform of  $x^{-1}e^{-x}$  equals  $\Gamma(s-1)$ . So, it will be the  $\Gamma(s-1)$ .

So, since I know Mellin transform of  $e^{-x}$  is  $\Gamma(s)$  using shifting property, we can tell that Mellin transform of  $x^{-1}e^{-x}$  is nothing but  $\Gamma(s-1)$ , so that this  $x^{-1}e^{-x}$  that is  $e^{-x}$  by  $x$  this is if you recall in the last slide itself, we have written  $f'(x)$  is nothing but  $-e^{-x}/x$ . So, that you can write down Mellin transform of  $f'(x)$ , this is equals to  $-\Gamma(s-1)$ .

And since Mellin transform of  $f'(x)$  is  $-\Gamma(s-1)$ , so this equals you can write down  $-(s-1)\bar{F}(s-1)$ , this is equals to  $-\Gamma(s-1)$ . If you recall from the Mellin transform of derivatives, we have proved this that Mellin transform of  $f'(x)$ , this is equals  $-(s-1)\bar{F}(s-1)$ . Just I am writing this, if you have forgotten Mellin transform of  $f'(x)$  equals  $-(s-1)\bar{F}(s-1)$ . So, from here I am writing Mellin transform of  $f'(x)$  equals  $-(s-1)\bar{F}(s-1)$  equals  $-\Gamma(s-1)$ .

So, once I am getting this, so therefore you can write down from here  $\bar{F}(s-1)$  this is equals to  $\Gamma(s-1)$  by  $(s-1)$ , the negative sign will be cancelled. So, that if I replace  $s-1$  by  $s$ , you will obtain  $\bar{F}(s)$ , this calls to  $\Gamma(s)$  by  $s$ , so therefore, you are  $\bar{F}(s)$  that is the required result Mellin transform of  $e^{-x}$  that is  $\bar{F}(s)$  this is equals to  $\Gamma(s)$  by  $s$ . So, please note this thing that we started from something other place that the Mellin transform of  $f(x)$  equals  $e^{-x}$  we are considered from there we started. And after that we are finding that Mellin transform of the function  $e^{-x}$ , this is equals to  $\Gamma(s)$  by  $s$ .

(Refer Slide Time: 07:35)

EX.  $M[Ci(x)]$ ,  $Ci(x)$ : Cosine Integral Function

$$Ci(x) = \int_x^{\infty} \frac{\cos t}{t} dt$$

$$f(x) = Ci(x) = \int_x^{\infty} \frac{\cos t}{t} dt$$

$$f'(x) = -\frac{\cos x}{x}$$

$$M[\cos kx] = k^{-s} \Gamma(s) \cos\left(\frac{s\pi}{2}\right)$$

$$M[\cos x] = \Gamma(s) \cos\left(\frac{s\pi}{2}\right)$$

Now, let us take another useful function that is we want to find out the Mellin transform of say we are denoting as  $Ci(x)$ , where  $Ci(x)$  is nothing but cosine integral function, cosine integral function. So, we want to find out the Mellin transform of  $Ci(x)$ , where  $Ci(x)$  is the cosine integral function and  $Ci(x)$  is defined as  $\int_x^{\infty} \frac{\cos t}{t} dt$ . So, cosine integral function is defined as  $\int_x^{\infty} \frac{\cos t}{t} dt$ . And we have to find out the Mellin transform of this function. Again just like earlier example, I am starting with  $f(x) = Ci(x)$  that is this integral  $\int_x^{\infty} \frac{\cos t}{t} dt$ .

If I differentiate with respect to  $x$  on the both side, then I will obtain  $f'(x) = -\frac{\cos x}{x}$ . Again I am doing it using the Leibniz integral formula. So, your  $f'(x)$  is equals to  $-\frac{\cos x}{x}$ . And your Mellin transform of this thing, we have done earlier if you recall Mellin transform of  $\cos kx$  equals  $k^{-s} \Gamma(s) \cos\left(\frac{s\pi}{2}\right)$ .

into  $\cos s \pi$  by 2. This we have done into the last to last lecture that Mellin transform of  $\cos k x$   $k$  to the equals  $k$  to the power minus  $s$  gamma  $s$  into  $\cos s \pi$  by 2, so that from here you can write down Mellin transform of  $\cos x$  this is nothing but your  $k$  will not be there so gamma  $s$  into  $\cos$  of  $s \pi$  by 2. So, please note that  $\mathcal{M}[f'(x)]$  is equals to minus  $\cos x$  by  $x$ . Now, first I am finding the Mellin transform of  $\cos x$  from Mellin transform of  $\cos k x$ , which we have done earlier, this is equals gamma  $s$  into  $\cos$  of  $s \pi$  by 2.

(Refer Slide Time: 10:13)

$$\begin{aligned} \mathcal{M}[\cos x] &= \Gamma(s) \cos\left(\frac{s\pi}{2}\right) \\ \mathcal{M}[x^{-1} \cos x] &= \Gamma(s-1) \cos\left(\frac{(s-1)\pi}{2}\right) \\ \mathcal{M}[f'(x)] &= -\Gamma(s-1) \cos\left(\frac{(s-1)\pi}{2}\right) \\ \Rightarrow -(s-1) \bar{F}(s-1) &= -\Gamma(s-1) \cos\left(\frac{(s-1)\pi}{2}\right) \\ \Rightarrow \bar{F}(s-1) &= \frac{\Gamma(s-1) \cos\left(\frac{(s-1)\pi}{2}\right)}{(s-1)} \\ \Rightarrow \bar{F}(s) &= \frac{\Gamma(s) \cos\left(\frac{s\pi}{2}\right)}{s} \end{aligned}$$

So, that again in the same way, so I am just writing this Mellin transform here, Mellin transform of  $\cos x$ , we got it as gamma  $s$  into  $\cos$  of  $s \pi$  by 2. But I am interested on  $\cos x$  by  $x$  so that Mellin transform of  $x$  to the power minus 1 into  $\cos x$ . This equals I can write down gamma  $s$  minus 1 into  $\cos$  of  $s$  minus 1 into  $\pi$  by 2. Again using the shifting property as I described in the last example, in the same way if I know the Mellin transform of  $\cos x$ , the Mellin transform of  $x$  to the power minus 1  $\cos x$ , where  $s$  will be replaced by  $s$  minus 1. So, that Mellin transform of  $x$  to the power minus 1  $\cos x$  equals to gamma  $s$  minus 1 into  $\cos$  of  $s$  minus 1 into  $\pi$  by 2 so that you can write down as you know Mellin transform of  $x$  dash  $\cos x$  or  $x$   $x$  to the power minus 1  $\cos x$  that is  $\cos x$  by  $x$ , and this is nothing but  $f$  dash  $x$ .

So, I am replacing this by this. And this is equals to your minus gamma  $s$  minus 1 into  $\cos$  of  $s$  minus 1 into  $\pi$  divided by 2. So, that from here again this equals Mellin

transform of  $f'(x)$ , this I can write down  $s^{-1} F(s)$ , this is equals  $s^{-1} \cos(s) \frac{\pi}{2}$ . I am not explaining the left hand side, because in the last example itself I have explained that the using the derivative property Mellin transform of  $f'(x)$  equals  $s^{-1} F(s)$ .

So, that from here you can write down  $s^{-1} F(s)$  this is equals to  $s^{-1} \cos(s) \frac{\pi}{2}$ . So, once I am getting this again from here  $F(s)$  I can write down as  $s \cos(s) \frac{\pi}{2}$ . So, therefore, you see the Mellin transform of cosine integral function, which is defined by the integral  $\int_0^\infty \cos t \frac{dt}{t}$  is equals to  $s \cos(s) \frac{\pi}{2}$ . So, Mellin transform of  $Ci(x)$  that this cosine integral function is equals to  $s \cos(s) \frac{\pi}{2}$ .

(Refer Slide Time: 13:17)

EX.  $M[S_i(x)]; S_i(x): \text{Sine Integral Function}$   
 $S_i(x) = \int_0^x \frac{\sin t}{t} dt$   
 $M[S_i(x)] = M\left[\int_0^x \frac{\sin t}{t} dt\right]$   
 $= -\frac{1}{s} M\left[\frac{\sin t}{t}; s+1\right]$

In the next example, let us see for the sin that is Mellin integral of  $S_i(x)$ , where your  $S_i(x)$  is nothing but again sine integral function;  $S_i(x)$  is sine integral function. And this  $S_i(x)$  is defined as  $S_i(x) = \int_0^x \sin t \frac{dt}{t}$ . So, we want to find out the Mellin transform of sine integral function, where the sine integral function  $S_i(x)$  is defined as  $\int_0^x \sin t \frac{dt}{t}$ .

So, once we are doing it Mellin transform of  $S_i(x)$ , this is equals to you can write down Mellin transform of  $\int_0^x \sin t \frac{dt}{t}$ , I am just putting the value of  $S_i(x)$ . And this

equals using Mellin transform on integrals, this equals I can write down minus 1 by s Mellin transform of sin t by t with the parameter s plus 1. So, please note that this Mellin transform of 0 to x sin t by t dt I am writing it as minus 1 by s into Mellin transform of sorry this M has not come, Mellin transform of sin t by t, where the parameter is s plus 1.

And here we have used the property of the Mellin transform on integrals or in other sense basically at first I have to find out what is the Mellin transform of sin t. Just like in the earlier cases already, you have done Mellin transform of sin k t using that one, I can find out the Mellin transform of sin t. And once I know the Mellin transform of sin t, from there I can find out the Mellin transform of sin t by t. So, Mellin transform of S i x, this is equals I am writing minus 1 by s Mellin transform of sin t by t with the parameter as s plus 1.

(Refer Slide Time: 15:45)

The image shows a whiteboard with handwritten mathematical derivations for Mellin transforms. The equations are as follows:

$$M[\sin kt] = k^{-s} \Gamma(s) \sin\left(\frac{s\pi}{2}\right)$$

$$M[\sin t] = \Gamma(s) \sin\left(\frac{s\pi}{2}\right) = F_1(s) \text{ (say)}$$

$$M\left[\frac{\sin t}{t}\right] = F_1(s-1) = \Gamma(s-1) \sin\left(\frac{(s-1)\pi}{2}\right) = F_2(s) \text{ (say)}$$

$$M[S_i(t)] = -\frac{1}{s} F_2(s+1) = -\frac{1}{s} \Gamma(s) \sin\left(\frac{s\pi}{2}\right)$$

So, you know these things already again we have done it Mellin transform of sin k t. This is equals k to the power minus s gamma s into sin of s pi by 2 we have proved this thing earlier. So that Mellin transform of sin t that is k equals 1, you are putting, so that this will be equals to gamma s into sin of s pi by 2, and this is equal say I am assuming F 1 s, I am assuming F 1 s say. So, from Mellin transform of sin k t I am finding Mellin transform of sin t, which is equals to gamma s sin s pi by 2 and which I am assuming as F 1 s.

Therefore, Mellin transform of  $\sin t$  by  $t$  again from the properties simply this will be equals to  $F(1/s - 1)$ . Mellin transform of  $\sin t$ , if Mellin transform of  $\sin t$  is  $F(1/s)$ , Mellin transform of  $\sin t$  will be  $F(1/s - 1)$ . And already I know what is  $F(1/s)$  so by substituting  $s$  by  $s - 1$ , I can write down the value of  $F(1/s - 1)$  also and which will be equals to  $\Gamma(s - 1) \sin(s - 1) \pi$  divided by 2. And say this is equals to again  $F(2/s)$  another function of  $s$ .

So, therefore, Mellin transform of  $\sin t$  by  $t$  is  $\Gamma(s - 1) \sin(s - 1) \pi$  by 2, which I am assuming as  $F(2/s)$ . From here, now, I can write down Mellin transform of  $S_i t$ , this is equals to nothing but minus 1 by  $s F(2/s + 1)$ , because from here  $\sin t$  by  $t$  is there from the properties we can always write down Mellin transform of  $S_i t$  this is equals to minus 1 by  $s F(2/s + 1)$ , so that  $F(2/s)$  is known to us. And I can substitute this, so minus 1 by  $s \Gamma(s) \sin(s) \pi$  by 2. Therefore, the Mellin transform of the sin integral function that is  $S_i t$  is equals to minus 1 by  $s \Gamma(s) \sin(s) \pi$  by 2.

(Refer Slide Time: 18:43)

EX.  $M[\text{erf}(x)]$ ;  $\text{erf}(x)$  Error function  
 $\text{erf}(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$   
 $M[e^{-ax^2}] = \frac{1}{2} a^{-n/2} \Gamma\left(\frac{n}{2}\right)$   
 $M[e^{-x^2}] = \frac{1}{2} \Gamma\left(\frac{n}{2}\right) = F(n)(a)$

So, now, let us take the next example, the earlier example was on sin integral function. Now, let us take the error function that is we want to find out the Mellin transform of  $\text{erf}$  of  $x$  again, your  $\text{erf}$  of  $x$ ,  $\text{erf}$  of  $x$  is error function. And if you recall already, we discussed error function when we started with the Laplace transform, this  $\text{erf}$  of  $x$  is defined as  $2$  by root over  $\pi$   $\int_0^x e^{-t^2} dt$ . The error function complementary error function, we have defined earlier whenever we did the Laplace

transform and the Fourier transform. So, now we want to find out the Mellin transform of error function of  $x$  that is  $\text{erf}$  of  $x$ . So, we start from this thing. If you remember we know the Mellin transform of  $e^{-x^2}$ . This we have done it earlier that is  $\frac{1}{2} \Gamma\left(\frac{s}{2}\right)$ .

So, since Mellin transform of  $e^{-x^2}$  equals  $\frac{1}{2} \Gamma\left(\frac{s}{2}\right)$ . Basically we are interested on  $e^{-t^2}$  is here. Since  $e^{-t^2}$  is here, therefore, we can just find out, we can just find out these from here  $e^{-x^2}$  is equals to  $\frac{1}{2} \Gamma\left(\frac{s}{2}\right)$ .

So, from here you can write down Mellin transform of  $e^{-x^2}$  as I was telling you in  $\text{erf}$  function it is given  $\int_0^x e^{-t^2} dt$ . So, we want to you are interested to find out the Mellin transform of  $e^{-x^2}$ . So, since we know Mellin transform of  $e^{-x^2}$ , from here you can write down Mellin transform of  $e^{-x^2}$ , this equals to  $\frac{1}{2} \Gamma\left(\frac{s}{2}\right)$ , here your  $a$  is equals to 1, and this equals  $\Gamma(s)$ . So, therefore, Mellin transform of  $e^{-x^2}$  equals to  $\frac{1}{2} \Gamma\left(\frac{s}{2}\right)$ , which is equals  $\Gamma(s)$ .

(Refer Slide Time: 21:21)

$$\begin{aligned}
 M[\text{erf}(x)] &= M\left[\frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt\right] \\
 &= \frac{2}{\sqrt{\pi}} \left(-\frac{1}{n}\right) M[e^{-x^2}, n+1] \\
 &= \frac{2}{\sqrt{\pi}} \left(-\frac{1}{n}\right) \Gamma(n+1) \\
 &= -\frac{2}{\sqrt{\pi}} \cdot \frac{1}{n} \cdot \frac{1}{2} \Gamma\left(\frac{n+1}{2}\right) \\
 &= -\frac{1}{\sqrt{\pi}} \frac{\Gamma\left(\frac{n+1}{2}\right)}{n}
 \end{aligned}$$

So, from here we are starting that Mellin transform of  $\text{erf}$  of  $x$  this equals Mellin transform of we are substituting the value of the  $\text{erf}$  of  $x$   $\frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$ . And this equals from property we can write down  $\frac{2}{\sqrt{\pi}}$  over

$\pi^{-1/2} s^{-1}$  into Mellin transform of  $e^{-x^2}$ , where the parameter is  $s+1$ . This equals  $\frac{2}{\sqrt{\pi}} \pi^{-1/2} s^{-1}$  of  $s+1$ . So, as you see Mellin transform of  $e^{-x^2}$ , where parameter is  $s+1$ . And already in the last slide we have shown that Mellin transform of  $e^{-x^2}$  is equals to  $\Gamma(s)$ .

Therefore, Mellin transform of  $e^{-x^2}$  with parameter  $s+1$  will be equals to  $\Gamma(s+1)$ . And this we are writing directly from the property, which we have done earlier so that if I substitute the value, this will be equals to  $\frac{2}{\sqrt{\pi}} \pi^{-1/2} s^{-1}$  into half into  $\Gamma(s+1)$ . And if I simplify it, this will be equals to  $\frac{1}{\sqrt{\pi}} s^{-1}$ , 2 will be cancelled, this equals to  $\frac{1}{\sqrt{\pi}} s^{-1}$ , this  $s$  will come. Therefore, the Mellin transform of error function equals to  $\frac{1}{\sqrt{\pi}} \Gamma(s+1)$ .

(Refer Slide Time: 23:31)

Ex.  $M[erfc(x)]$ ,  $erfc(x)$ : Complementary Error Function  
 $erfc(x) = 1 - \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt = \frac{2}{\sqrt{\pi}} \int_x^{\infty} e^{-t^2} dt$   
 $f(x) = erfc(x)$   
 $\Rightarrow f'(x) = -\frac{2}{\sqrt{\pi}} e^{-x^2}$   
 $M[f'(x)] = -\frac{2}{\sqrt{\pi}} M[e^{-x^2}]$

Now, let us see the complementary error function, Mellin transform of complementary error function that is Mellin transform of  $erfc(x)$ , which is write  $s$  again complementary error function also we have done earlier when we were studying the Laplace transform. So,  $erfc(x)$  is complementary error function. So, this complementary error function is given by  $erfc(x)$ , this is equals to I can write down that is  $1 - \text{error function of } x$ , this is equals to I can write down that is  $1 - \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$ . This equals directly also you can write down  $\frac{2}{\sqrt{\pi}} \int_x^{\infty} e^{-t^2} dt$ .

So, complementary error function equals  $1 - \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$  that is  $1 - \text{erf}(x)$  or I can write it as  $\frac{2}{\sqrt{\pi}} \int_x^\infty e^{-t^2} dt$ . So, I have to find out the Mellin function, Mellin transform of the complementary error function of  $x$ .

Now, I am starting with this  $f(x)$  equals again I am considering  $\text{erfc}(x)$  just, we have done it for the earlier example so that from here, you can write down  $f'(x)$  is nothing but  $-\frac{2}{\sqrt{\pi}} e^{-x^2}$ . I am using this so  $\frac{2}{\sqrt{\pi}} e^{-x^2}$ . Therefore, Mellin transform of  $f'(x)$  this is equals to  $-\frac{2}{\sqrt{\pi}}$  Mellin transform of  $e^{-x^2}$  I can write down. This Mellin transform of  $f'(x)$ , this is equals  $-\frac{2}{\sqrt{\pi}}$  Mellin transform of  $e^{-x^2}$ , I know the Mellin transform of  $e^{-x^2}$  square, I know that Mellin transform of  $f'(x)$  this I can write down in other property.

(Refer Slide Time: 26:05)

$$\begin{aligned}
 M[f'(x)] &= -\frac{2}{\sqrt{\pi}} M[e^{-x^2}] \\
 -(s-1)\bar{F}(s-1) &= -\frac{2}{\sqrt{\pi}} \cdot \frac{1}{2} \Gamma\left(\frac{s}{2}\right) \\
 \Rightarrow \bar{F}(s-1) &= \frac{1}{\sqrt{\pi}} \frac{\Gamma(s/2)}{s-1} \\
 \Rightarrow \bar{F}(s) &= \frac{1}{\sqrt{\pi}} \frac{\Gamma\left(\frac{s+1}{2}\right)}{s} \\
 &= M[\text{erfc}(x)].
 \end{aligned}$$

So, I am just using this one, I am writing again Mellin transform of  $f'(x)$ , this is equals to  $-\frac{2}{\sqrt{\pi}}$  Mellin transform of  $e^{-x^2}$  square. So, once I am writing this from here, Mellin transform of  $s f'(x)$ , I can write down  $-(s-1)$  into  $\bar{F}(s-1)$  this we have used earlier also. So, this equals  $-\frac{2}{\sqrt{\pi}}$  Mellin transform of  $e^{-x^2}$  square will be half into  $\Gamma(s/2)$ , because Mellin transform of  $e^{-x^2}$  square is half into  $\Gamma(s/2)$ .

$s$  by 2,  $a$  is 1. So, that Mellin transform of  $e^{-x^2}$  will be equals to half into  $\Gamma(s/2)$ .

So, from here I can write down  $\bar{F}(s-1)$ , this is equals to  $\frac{1}{\sqrt{\pi} \Gamma(s/2)}$  will come, this 2 will be cancelled divided by  $s-1$ . So, that your  $\bar{F}(s)$ , this is equals to I can write down  $\frac{1}{\sqrt{\pi} \Gamma(s/2+1)}$ ,  $s$  will be replaced by this divided by  $s$ , so that the Mellin transform of complementary error function, because this is nothing but the Mellin transform of  $\text{erfc}(x)$  complementary error function of  $x$ , this is equals to  $\frac{1}{\sqrt{\pi} \Gamma(s/2+1)}$  divided by  $s$ .

So, in the next class, we will continue with some more example on Mellin transform. And then in the subsequent lectures, we will go through another important transform, which we call as Z-transform which is being used in basic many statistical methods also.
