**Lecture 13**  
**Dimensions of Sums of Subspaces**

Okay, so let us continue our discussion on dimensions of subspaces, I will like to prove a few results today on computing the dimension of certain subspaces but before that let me give you one or two general results which were hinted in couple of lecture ago when we discussed the notion of linear independence, okay.

(Refer Slide Time: 0:47)

So let me start with this result I have a square matrix with real entries order  $n$  if the columns of  $A$  are linearly independent then the matrix  $A$  is invertible you might remember that we made use of this fact in a numerical example let us prove this general result, okay.

If the columns of  $A$  are linearly independent then  $A$  is invertible actually there is a corresponding results for the rows I have a square matrix the rows of  $A$  are linearly independent then it will be invertible, okay that is a result which you could prove using this result so I will not state that result I will only prove this result. Let me denote, okay super scripts 1, 2, 3 etcetera,  $n$  will denote the columns of  $A$  that is I can write  $A$  as  $a_1, a_2, a_3$ , etcetera,  $a_n$ , okay what is given is that these columns are linearly independent you must show that  $A$  is invertible, okay we will make use of a result that we proved some time ago a matrix  $A$  is invertible if and only if the non-homogeneous equation  $Ax$  equal to  $b$  has a solution for all  $b$ , okay.

So let us take let us consider the system  $Ax$  equals  $e_1$ ,  $e_1$  is the standard first standard basis vector of  $R^n$ , okay so let me just write it is a column vector whose first coordinate is 1 all other entries is 0 the claim is the above system has a solution this is the claim we will prove this claim. Once we have this we can change the right hand side what we will show is that if the columns are linearly then this system will have a solution the next system  $Ax$  equal to  $e_2$  will have a solution,  $Ax$  equal to  $e_3$  etcetera  $Ax$  equal to  $e_n$  all these  $n$  systems will have a solution we will prove that, once we prove that these  $n$  systems have a solution it will follow that  $A$  is invertible, okay I will give the details but before that how do we show that this system has a solution.

I have this right hand side vector, okay this is a vector in  $R^n$ , okay let us now recall what we proved in the last lecture if I have a linearly independent subset of a vector space having the same number of elements as the dimension of the space then this linearly independent subset must be a basis.

(Refer Slide Time: 5:07)

For  $e_1$  there exists scalars I will call it  $x_1, x_2$ , etcetera,  $x_n$  such that  $e_1$  is in  $\mathbb{R}^n$  the vectors  $a_1, a_2$ , etcetera, and the column vectors are linearly independent so  $e_1$  can be written as a linear combination I will take the coefficient to be these, so  $e_1$  is  $x_1 a_1$  plus  $x_2 a_2$  plus etcetera  $x_n a_n$ , okay this is because of the fact that any linearly independent subset of  $V$  having the same number of elements as the dimension of  $V$  must be a basis so it must be a spanning set in particular so any vector in  $\mathbb{R}^n$  I must be able to write it as a linear combination of these vectors.

So I have these but let us rewrite this using the matrix  $A$  can you see that this is  $a_1, a_2$ , etcetera, an into the vector  $x_1, x_2$ , etcetera,  $x_n$  now this is this can be easily verified it is  $x_1 a_1$  plus  $x_2 a_2$  etcetera plus  $x_n a_n$  that is this expression but this is my  $a$  so this is equal to  $Ax$  what I have shown is that then  $e_1 = Ax$  equal to  $e_1$  that is this system  $Ax = e_1$  that has a solution that comes from the fact that  $e_1$  belongs to the span of the column vectors of  $A$  what I have done for  $e_1$  can be done for  $e_2, e_3$ , etcetera.

Let me simply say similarly  $Ax = e_i$  all these systems have a solution for  $1 \leq i \leq n$  all these systems have a solution, okay what I will do is let me denote the solution for the first system by  $x^1$  and denote the solution of the  $i$ th system by  $x^i$  I will collect the column vectors  $x_1, \dots, x_n$  denote that by capital  $X$ .

(Refer Slide Time: 7:46)

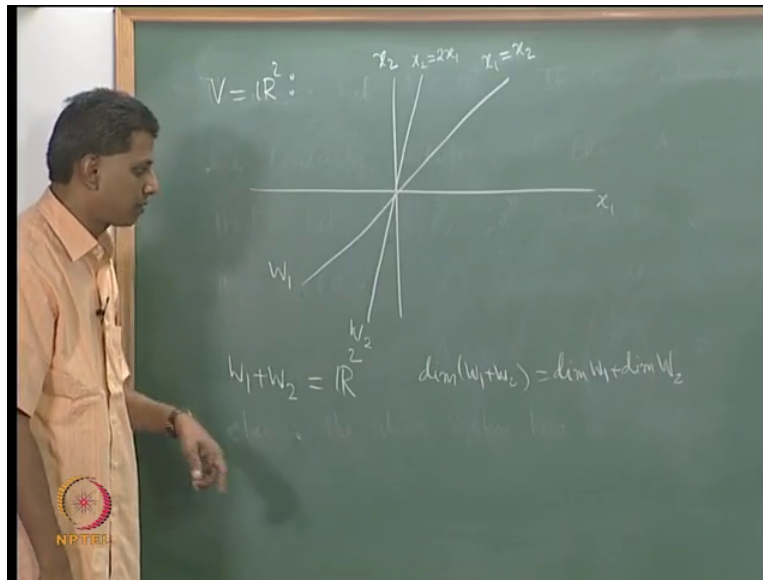

Let capital X equal  $x_1, x_2, \dots, x_n$  please observe that for a given vector its components are denoted using subscripts and different vectors are denoted by using superscripts. Different vectors are denoted by using superscripts  $e_1, e_2, \dots$  appearing here. Components will be  $x_1, x_2, \dots, x_n$ . Components of  $x_1$  are these, okay so I have a matrix now this belongs to  $\mathbb{R}^n \times \mathbb{R}^n$  remember that each of these is a column vector so this is an  $n \times n$  matrix.

Now consider  $AX$  A multiplied with the matrix X this is  $a_1, a_2, \dots$  okay let me write this as  $x$  is given here it is  $Ax_1, Ax_2, \dots, Ax_n$  using matrix multiplication you can verify that this is the same as  $Ax_1, Ax_2, \dots, Ax_n$  using matrix multiplication this can be verified but this is  $e_1, e_2, \dots, e_n$   $e_1$  is 100,  $e_2$  is 010 etcetera so can you see that this is identity of order  $n$ , okay and so what we have shown is that this matrix X satisfies the equation  $Ax = I$  again go back

to a result that we proved if a matrix if I have a square matrix which has either a left inverse or a right inverse then it must be invertible so the conclusion follows.

So  $A$  has a right inverse and since  $A$  is square  $A$  is invertible, okay this is one of the results which I taught you must know, okay so let us move on I want to discuss the formula for the dimension of a sum of two subspaces, what is the formula for the dimension of the sum of two subspaces let me give a motivating example and then prove this general result.

(Refer Slide Time: 10:47)

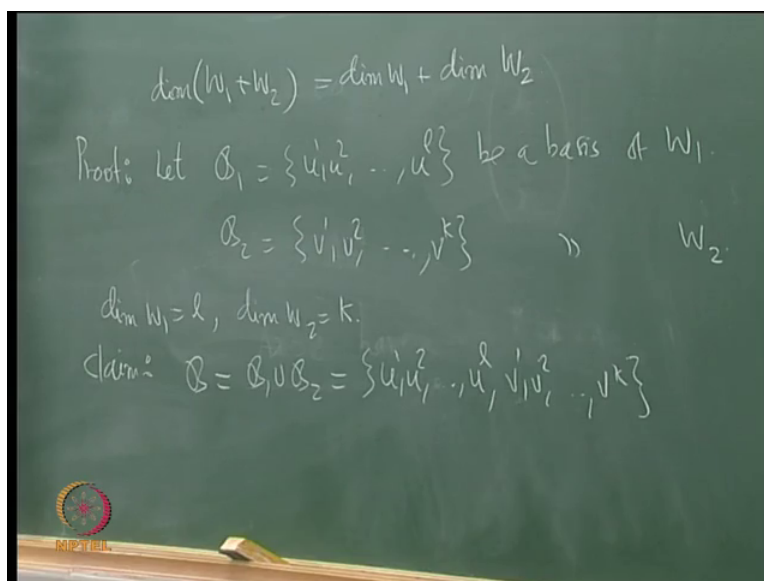

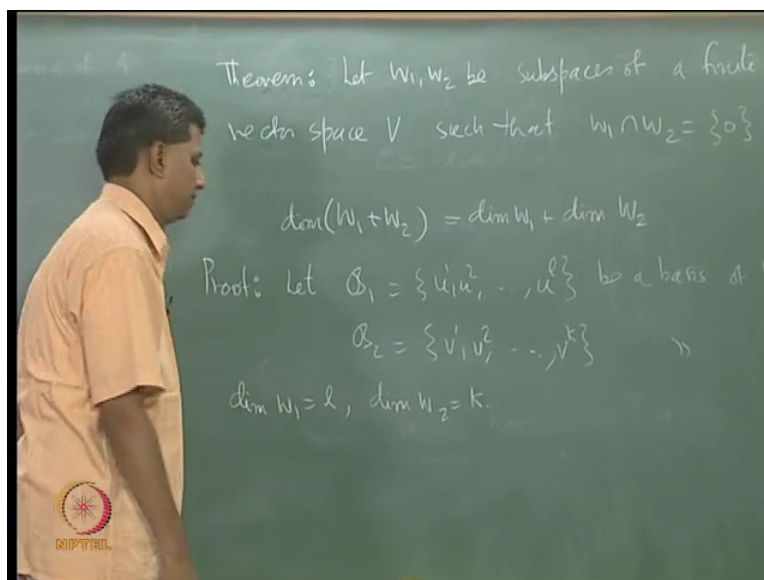

Let us look at the case of  $\mathbb{R}^2$  and, okay  $\mathbb{R}^2$  I have a horizontal axis I have a vertical axis let us look at this is a origin let us look at a line like this, okay this is so called  $y$  equal to  $x$  I will use  $x_1$  equals  $x_2$  let me use some other line  $x_1$  equals  $x_2$  equals  $2x_1$  something like this this is  $x_2$  is the height  $x_2$  is  $2x_1$ , okay they are supposed to pass through the origin let us call this as a subspace what I know is that any line passing through the origin is a subspace so this  $w_1$  is a subspace this is another line  $w_2$  is a subspace, okay I want to look at  $w_1$  plus  $w_2$ , okay the dimension of  $\mathbb{R}^2$  is 2 dimension of  $w_1$  is 1 dimension of  $w_2$  is 1 what we observe here is that dimension of  $w_1$  plus  $w_2$  is equal to dimension  $w_1$  plus dimension  $w_2$ , in this particular example  $w_1$  plus  $w_2$  I am saying has dimension 2  $w_1$  plus  $w_2$  I am claiming is the whole of  $\mathbb{R}^2$ , what is the reason for that? The reason is as follows I must show that I must show that  $w_1$  plus  $w_2$  has a basis consisting of two elements then it will follow that  $w_1$  plus  $w_2$  is two dimensional that is equal to  $\mathbb{R}^2$  but take any vector lying on  $w_1$  call that  $u$  take another vector on  $w_2$  call that  $V$  since they are in two different lines one is not a multiple of the other because if one were a multiple of the other they would lie on the same line.

So take any vector on  $w_1$  call that  $u$  on  $w_2$   $u$  and  $V$  are linearly independent  $u$  and  $V$  span  $w_1$  plus  $w_2$ , is that obvious? Anything in  $w_1$  can be written as a multiple of  $u$  anything in  $w_2$  can be written as a multiple of  $V$ . So anything in  $w_1$  plus  $w_2$  can be written as a linear combination of  $u$  and  $V$  and so  $w_1$  plus  $w_2$  is  $\mathbb{R}^2$  in this example the sum of these two subspaces is equal to the vector space the original space that we started with and what we observed is that so dimension of  $w_1$  plus  $w_2$  it is equal to dimension  $w_1$  plus dimension  $w_2$ , okay.

We look at a generalization of this particular example in a general vector space not necessarily  $\mathbb{R}^2$  but this does not hold always in a general vector space what we have not observed what we have not made use of is the fact that the intersection is singleton  $0$ , the intersection  $w_1$

intersection  $w_2$  in this example is a singleton  $0$ . So we will show that this holds if  $w_1$  intersection  $w_2$  is singleton  $0$ , okay.

(Refer Slide Time: 14:21)

So we want to prove a result that generalizes this equation, first let me take the case when the intersection is singleton  $0$  so I would like to prove the following result, let  $w_1$  and  $w_2$  be subspaces of a finite dimensional vector space  $V$  such that  $w_1$  intersection  $w_2$  is singleton  $0$ .

Remember that  $w_1$  intersection  $w_2$  must be a subspace intersection of two subspaces must be a subspace so it must have at least a  $0$  vector, here it has at most  $0$  it has precisely the  $0$  vector then we have the following formula dimension of  $w_1$  plus  $w_2$  this is dimension  $w_1$  plus dimension  $w_2$ , okay we will next prove a result which is generalization of this but for that we need the

notion of extending a basis for a subspace to a basis for the entire space, so let me first give this result give that a little later. So I want to prove this result let us observe that this is well defined  $w_1$  plus  $w_2$  was defined earlier and we know that it is a subspace, so one can talk about the dimension of a subspace what we also know is that dimension of the subspace cannot exceed the dimension of  $V$ ,  $V$  is finite dimensional.

Similarly these two numbers these two are integers  $w_1$  and  $w_2$  are subspaces so these two numbers are well defined, okay how do we proof? The proof is probably along expected lines that is let us take the idea of the proof is as follows you take a basis for  $w_1$ , take a basis for  $w_2$  simply join them that will turn out to be a basis for  $w_1$  plus  $w_2$  in this case because the intersection is singleton  $0$  otherwise it won't be. So let me take  $b_1$  to be  $u_1, u_2, \text{etcetera}, u_l$  let  $b_1$  be a basis of  $w_1$   $u_1, u_2, \text{etcetera}, u_l$  that is a basis of  $w_1$ ,  $b_2$  will be  $v_1, v_2, \text{etcetera}, v_k$  this will be a basis of  $w_2$ , so I have taken a basis for  $w_1$  and a basis for  $w_2$  I know there dimensions I have written down explicit basis.

So dimension  $w_1$  is  $l$ , dimension  $w_2$  is  $k$ , what is a claim as I mentioned let me call it  $b$ ,  $b$  is a union of these two basis  $b_1$  union  $b_2$  this is  $u_1, u_2, \text{etcetera}, u_l, v_1, v_2, \text{etcetera}, v_k$  the claim is that this is a basis of  $w_1$  plus  $w_2$  this is the claim is that this is the basis of  $w_1$  plus  $w_2$ , okay to prove that this is a basis of  $w_1$  plus  $w_2$  we need to verify the two conditions that this is linearly independent and a spanning subset.

(Refer Slide Time: 18:33)

Handwritten mathematical proof on a chalkboard:

$$\text{Let } z \in w_1 + w_2. \text{ Then } \exists z \in w_1, y \in w_2 \text{ s.t. } z = x + y.$$

$$x = \beta_1 u^1 + \beta_2 u^2 + \dots + \beta_l u^l, \quad u^1, u^2, \dots, u^l \in w_1$$

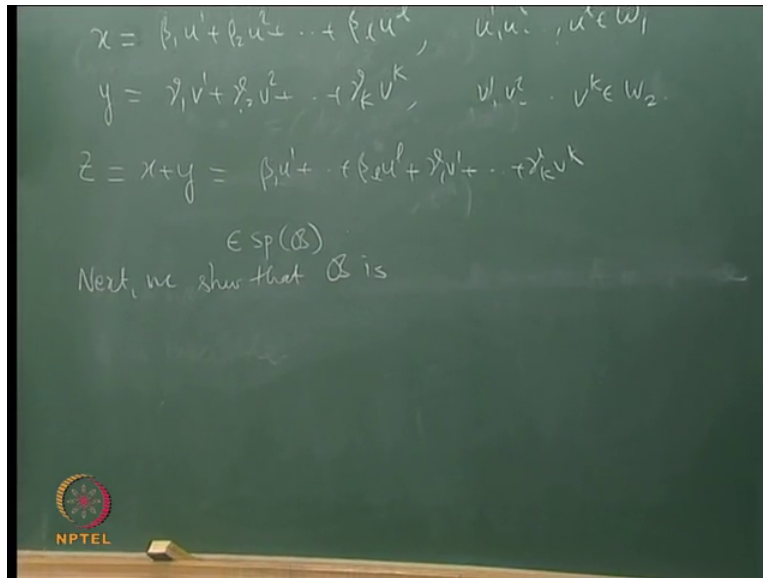

$$y = \gamma_1 v^1 + \gamma_2 v^2 + \dots + \gamma_k v^k, \quad v^1, v^2, \dots, v^k \in w_2.$$

$$z = x + y = \beta_1 u^1 + \dots + \beta_l u^l + \gamma_1 v^1 + \dots + \gamma_k v^k$$

$$\in \text{sp}(B)$$

NPTEL logo is visible in the bottom left corner of the chalkboard image.

To verify that it is a spanning subset that is almost there let us take  $z$  to be in  $w_1$  plus  $w_2$ , then there exist  $x$  in  $w_1$ ,  $y$  in  $w_2$  such that  $z$  can be written as  $x$  plus  $y$  that is a definition of  $w_1$  plus  $w_2$ . Now  $x$  is in  $w_1$  and  $w_1$  has this as a basis so  $x$  is a linear combination I will call it  $\beta_1 u_1$ ,  $\beta_2 u_2$  plus etcetera  $\beta_l u_l$  where I observed that  $u_1, u_2$ , etcetera,  $u_l$  of course belongs to  $w_1$  that is coming from the basis  $y$  is in  $w_2$  that is a linear combination of  $v_1, v_2$ , etcetera,  $v_k$   $\gamma_1 v_1$  plus  $\gamma_2 v_2$   $\gamma_k v_k$  of course  $v_1, v_2$ , etcetera,  $v_k$  come from  $w_2$  just to emphasize.

Then look at  $z$ ,  $z$  is  $x$  plus  $y$  that is  $\beta_1 u_1$  etcetera  $\beta_l u_l$  plus  $\gamma_1 v_1$  plus etcetera plus  $\gamma_k v_k$  no more interpretation of what the right hand side is I simply observe that this belongs to span of  $\mathcal{B}$  it is a linear combination of the vectors of  $\mathcal{B}$  and so what we have shown is that this is a spanning set I started with an arbitrary  $z$  in  $w_1$  plus  $w_2$  I have shown that element is in span of  $\mathcal{B}$ .

So  $w_1$  plus  $w_2$  is equal to span of  $\mathcal{B}$  we need to now show that this is the basis the last step then is to show that  $\mathcal{B}$  is linearly independent, okay next we show that this set  $\mathcal{B}$  is linearly independent, that is  $u_1, u_2$ , etcetera,  $u_l, v_1, v_2$ , etcetera,  $v_k$  are linearly independent vectors next to show that  $\mathcal{B}$  is linearly independent, okay to show that they are linearly independent you must consider a linear combination equate that to 0 show that the scalars are 0 so let me do it on this side.

Remember till now we have not made use of the fact that  $w_1$  intersection  $w_2$  is singleton 0 we will use that now.

(Refer Slide Time: 21:26)

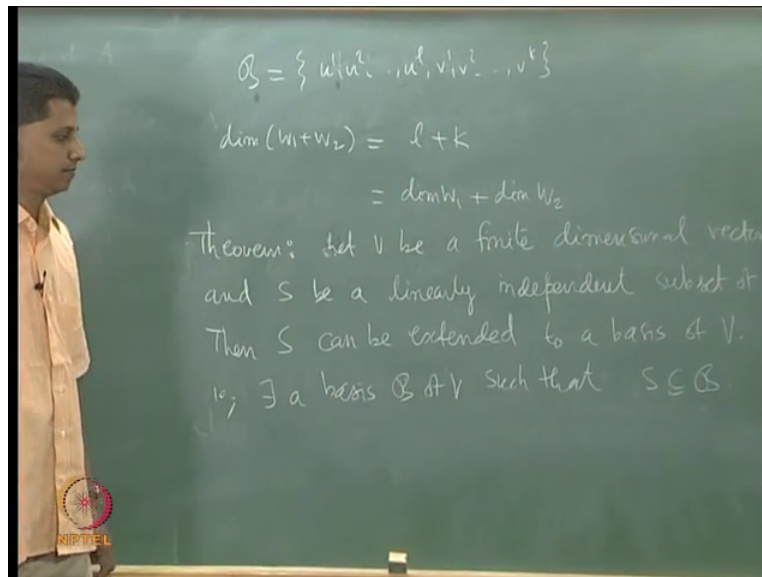

Consider a linear combination let us say  $\alpha_1 u_1, \alpha_2 u_2$  etcetera  $\alpha_l u_l$  plus some  $\delta_1 v_1$  etcetera  $\delta_k v_k$  equate that to 0. Now this is a vector in  $w_1$  I will call this  $u$  is a vector in  $w_1$  this is a linear combination of  $u_1, u_2,$  etcetera,  $u_l$  which are in  $w_1$  so this is a vector in  $w_1$  this is a vector in  $w_2$  I will call this  $v$ , okay.

So what I have is  $u + v = 0$  that is  $u = -v$ , okay but  $u$  is in  $w_1$   $v$  is in  $w_2$  this means  $u$  for instance belongs to  $w_1 \cap w_2$  which is the same as saying  $v$  belongs to  $w_1 \cap w_2$  let me just say this belongs to  $w_1 \cap w_2$ , on the left hand side I have a vector in  $w_1$  on the right hand side I have a vector in  $w_2$  they are equal and so  $u$  or  $v$  belongs to  $w_1 \cap w_2$  which I know is singleton  $\{0\}$  which means let us say  $u = 0$   $u$  is a vector but go back and see what  $u$  is that is  $\alpha_1 u_1 + \alpha_2 u_2$  etcetera  $\alpha_l u_l$  this is 0 but now I make use of the fact that  $u_1, u_2,$  etcetera,  $u_l$  they form a basis so they are linearly independent so from this it follows that  $\alpha_1, \alpha_2,$  etcetera,  $\alpha_l$  they all must equal 0.

So I have taken care of the first part the coefficients corresponding to the part they are 0, similarly  $v$  is 0 because  $v$  is minus  $u$  since  $v$  is also 0 it follows that by a similar argument it follows that  $\delta_1 = \delta_2,$  etcetera  $\delta_k = 0$ , okay so what we have done is to start with a linear combination of the vectors  $u_1$  etcetera  $u_l$   $v_1$  etcetera  $v_k$  equate that to 0 we have shown in the last step that this holds only if the scalars are 0 so the vectors are linearly independent so  $B$  is a basis of the sum  $w_1 + w_2$  now you see the formula holds, yes sir  $u$  belongs to  $w_1$   $v$  belongs to  $w_2$  but  $u = -v$  which means that  $v$  is already in  $w_1$  but since  $v$  is minus  $u$  and  $u$  belongs to  $w_1$   $v$  also belongs to  $w_1$   $v$  is already in  $w_2$  by virtue of this equation  $v$  is minus  $u$   $w_1$  is a subspace if  $u$  belongs to  $w_1$  minus  $u$  belongs to  $w_1$  and so  $v$  to  $w_1$  also.

So  $v$  belongs to  $w_1$  intersection  $w_2$  as well as  $u$  because again  $w_1$  intersection  $w_2$  is a subspace so if I have a vector which is in the subspace its negative will also be in that subspace, I hope it is clear, okay.

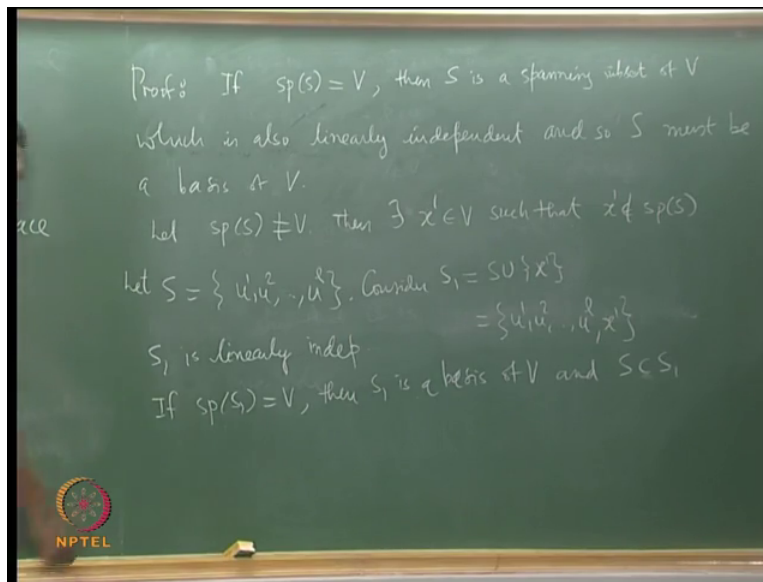

(Refer Slide Time: 25:22)

I have written down how does a formula hold I have written down the explicit basis for  $b$  in terms of basis of  $w_1$  and  $w_2$  basis of  $w_1$  plus  $w_2$  that is  $u_1, u_2$ , etcetera  $u_l, v_1, v_2$ , etcetera,  $v_k$  we have shown that this is a basis of  $w_1$  plus  $w_2$  so look at dimension of  $w_1$  plus  $w_2$   $l$  plus  $k$  but  $l$  is a dimension of  $w_1$  and  $k$  is a dimension of  $w_2$   $u_1$  etcetera  $u_2$  etcetera  $u_l$  is a basis for  $w_1$   $v_1$  etcetera  $v_k$  is a basis for  $w_2$  so dimension of  $w_1$  is  $l$  dimension of  $w_2$  is  $k$  so I have this equation, okay. There is a more general formula we will prove it a little later because we need a little result before that, okay.

Now what is a result that we will need to prove this general formula let me state this, let  $V$  be a finite dimensional vector space and  $S$  be a linearly independent subset  $S$  is a linearly independent subset of a finite dimensional vector space  $V$  then  $S$  is part of a basis of  $V$  that is  $S$  can be extended to a basis of  $V$  any linearly independent subset of a finite dimensional vector space can be extended to a basis of  $V$ , what is the meaning of this? The meaning of this is let  $S$  be a linearly independent subset of a finite dimensional vector space  $V$  let us script  $b$  be a basis of  $V$ , I am sorry there exists a basis script  $b$  of  $V$  such that  $S$  is contained in  $B$  that is there exists a basis script  $b$  of  $V$  such that this  $S$  is contained in script  $b$ , okay the proof will make use of a result that we proved earlier, okay.

(Refer Slide Time: 28:37)

What is given is that  $S$  is linearly independent, okay if span of  $S$  equals  $V$  then there is nothing to prove, why? If span of  $S$  is equal to  $V$  then  $S$  is a spanning subset of  $V$  which is also linearly independent, sorry yeah which is also linearly independent and so  $S$  must be a basis, in this case that is a span of  $S$  is the whole of  $V$  then there is nothing to prove already  $S$  is linearly independent if span of  $S$  is equal to it follows that  $S$  is a basis.

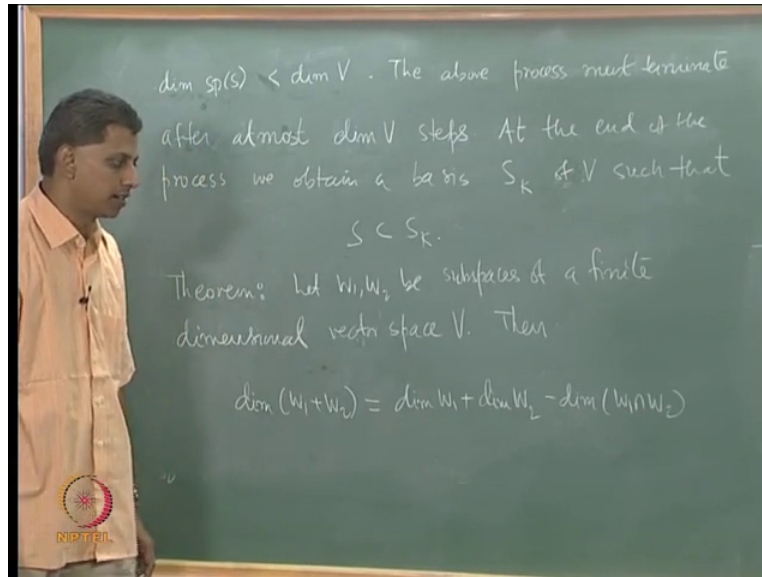

So trivially  $S$  is part of a basis of  $V$ , if span of  $S$  is not equal to  $V$  so let us consider the case that span of  $S$  is not equal to  $V$  span of  $S$  is a subspace it is contained in  $V$  it is not equal to  $V$  means there is a vector in  $V$  which is not in span of  $S$ , then there exist a vector I will call it  $x_1$  in  $V$  such that this vector does not belong to span of  $S$ . Now let me write  $S$  explicitly I have  $S$  to be equal to let us say  $u_1, u_2$ , etcetera,  $u_l$  I know that this is linearly independent I am now appending  $x_1$  to this set  $S$  consider  $S_1$  equals  $S$  union  $x_1$  this is  $u_1, u_2$ , etcetera  $u_l, x_1$  now we have encountered this situation before since  $x_1$  does not belong to span of  $S$  it follows that this set  $S_1$  since  $x_1$  does not belong to span of  $S$  it follows that set  $S_1$  is linearly independent.

If this set  $S_1$  were linearly dependent then there is a vector which is a linear combination of the preceding vectors that cannot happen for  $u_1, u_2$ , etcetera,  $u_l$  because they are already linearly independent the only way that  $S_1$  is linearly dependent is that this  $x_1$  is a linear combination of  $u_1$ , etcetera,  $u_l$  but that does not happen because  $x_1$  does not belong to span of  $S$  so this  $S_1$  is linearly independent, okay.

$S_1$  is linearly independent then it is like going back to this if then, if span of  $S_1$  equals  $V$  we are done it would then follow that  $S_1$  is a basis as before if span of  $S_1$  equals  $V$  then  $S_1$  is a basis of  $V$ , and what we want to show? We want to show that this  $x$  can be extended to a basis it is clear by the construction that  $S$  is contained in  $S_1$ . So if  $S_1$  is basis then we know that  $S$  is contained in  $S_1$  and so the linearly independent subset  $S$  that we started with is a subset of a basis  $S_1$ , if it is

not equal to  $V$  we repeat the procedure, okay but remember what happens in this case, in this case in the first case let me go back and write down the inequalities for the dimension why should this process terminate, okay that is a question why should this process terminate.

(Refer Slide Time: 33:31)

In the first case what is the dimension of the span of  $S$  if it is equal to the dimension of the original space then they are equal so in the second case this is less than or equal to dimension of  $V$  strictly less than dimension of  $V$ , that is this corresponds to dimension of span of  $S$  being equal to dimension of  $V$  so the subspace is equal to  $V$  so  $S$  is a basis in this case we know that there is nothing to prove we are looking at the case when the span of  $S$  is not equal to  $V$  this is a subset not the whole space, so the dimension of this must be strictly less than dimension of  $V$ .

In the next step the dimension of the dimension has been increased by 1,  $S_1$  has one element more than  $S$  so the dimension of this subspace has been increased so these are integers these are positive integers dimensions are positive integers, so from the previous step we have bridged the gap by one number one integer so span of  $S$  is now it is quite possible it is equal to  $V$  but if it is not equal to  $V$  we will definitely it is clear that the dimension of this subspace is one more than the dimension of span of  $S$ .

So this process has to terminate because  $V$  is finite dimension, since  $V$  is finite dimensional the above process that is argument the above process must terminate after at most dimension  $V$  steps in fact it is less than this it is at most after dimension of  $V$  minus dimension span  $S$  steps but in any case it does not exceed this number. Now since this is finite and every time you are increasing the dimension by 1 this procedure must stop, okay.

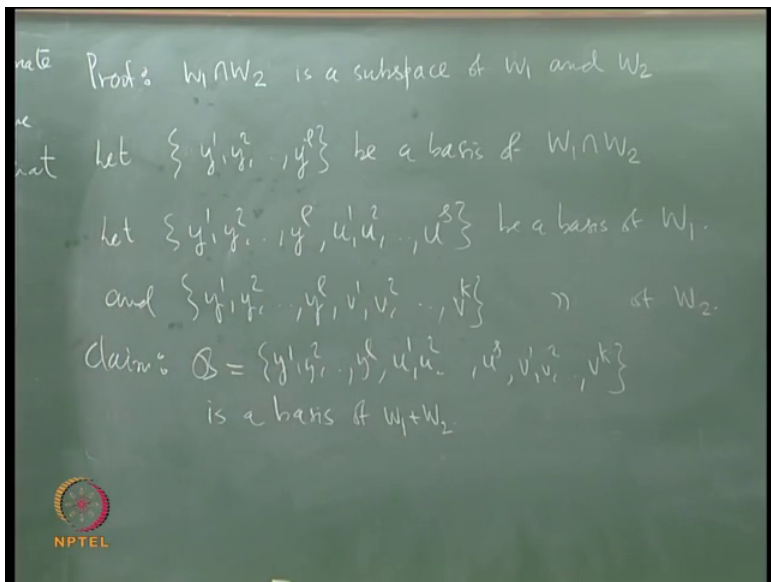

So at the end of the procedure you have a subset let us say  $S_k$  which is a basis, okay maybe I will just conclude at the end of the procedure at the end of the process we obtain a basis  $S_k$  such that

a basis  $S_k$  of  $V$  such that  $S$  is contained in  $S_k$  which is what we wanted to prove that this  $S$  is a part of a basis of  $V$ , okay. So let us make use of this result there is a counterpart to this result probably I will leave that as an exercise the counterpart is as follows, remember this process in formally what it means is that you can start with a basis rather you can start with a linearly independent subset of a vector space if the vector space is finite dimensional you can go from this linearly independent subset to a basis.

A maximal linearly independent subset is a basis a minimal spanning set is also a basis, okay a maximal from a linear independent set you are adding one vector at a time. So a maximal linearly independent set as well as a minimal spanning set must be basis of a finite dimensional vector space, okay I will leave that problem as an exercise for you to solve. Now using this I would like to derive the particular identity for the sum of two subspaces in the general case when the intersection is not necessarily singleton  $0$ , okay.

So what I want to prove is this theorem, let  $w_1, w_2$  be subspaces of a finite dimensional vector space  $V$  then dimension of the sum  $w_1$  plus  $w_2$  is the sum of the dimensions remember this time I have removed the restriction that the intersection must be singleton  $0$  I need to bring in that here in the right hand side minus dimension  $w_1$  intersection  $w_2$ , okay so this is the formula then for general subspaces  $w_1, w_2$  formula for the sum of two general subspaces  $w_1$  and  $w_2$  you can now see that this is more general then the result that I proved today because of the fact that we also assume the dimension  $w_1$  intersection  $w_2$  is  $0$  in that case so we assume that  $w_1$  intersection  $w_2$  is singleton  $0$  so dimension is  $0$  so this number does not appear so I have this formula.

(Refer Slide Time: 39:13)

So this reduces to the earlier formula, okay the proof you will see is somewhat similar in the earlier idea of the earlier proof will be used, okay proof as before, okay this time I will do it little differently look at  $w_1$  intersection  $w_2$  this is not only a subspace of  $V$  it is a subspace of  $w_1$  as

well as  $w_2$  is a subspace of  $w_1$  as well as  $w_2$ , okay. So what I will do is start with a basis for  $w_1$  intersection  $w_2$ , okay this time I will not use  $b_1, b_2$ , etcetera I will write down this explicitly let  $y_1, y_2$ , etcetera,  $y_l$  be a basis of  $w_1$  intersection  $w_2$  this is a basis of  $w_1$  intersection  $w_2$  this is a subspace of  $w_1$ ,  $w_1$  itself is a subspace so  $w_1$  is a vector space in its own right I have a linearly independent subset of a vector space  $w_1$  this can be extended to a basis of  $w_1$  all the spaces are finite dimensional  $V$  is finite dimensional so  $w_1, w_2, w_n$  intersection  $w_2$  all these are finite dimensional.

So I am now making use of the previous result that this being a linearly independent subset of  $w_1$  and  $w_1$  is a vector space this can be extended to be basis of  $w_1$ , similarly  $w_2$ . So let me write down a basis extending this explicitly let  $y_1, y_2$ , etcetera,  $y_l$  comma I will use  $u_1, u_2$ , etcetera,  $u_s$  let this be a basis of  $w_1$  this is possible by the previous result and  $y_1, y_2$ , etcetera,  $y_l, v_1, v_2$ , etcetera,  $v_k$  I will use  $k$  be a basis of  $w_2$  I started with a basis of  $w_1$  intersection  $w_2$  I can extend these basis to basis of  $w_1$  as well as  $w_2$ . So you observe the first part is coming from this basis of  $w_1$  intersection  $w_2$  for these two the first part comes from this, okay.

Now the claim is you see that this vector repeats so what I will do is I will collect  $y$ 's,  $u$ 's and  $v$ 's I will call this now as script  $b$  collect  $y$ 's,  $v$ 's and  $u$ 's  $y_1, y_2$ , etcetera,  $y_l, u_1, u_2$ , etcetera,  $u_s$  and  $v_1, v_2$ , etcetera,  $v_k$  collect all these vectors the claim is that this is a basis of  $w_1$  plus  $w_2$ . Let us assume for the moment that we have proved that this is a basis of  $w_1$  plus  $w_2$  let us quickly verify whether the consequence that this formula holds.

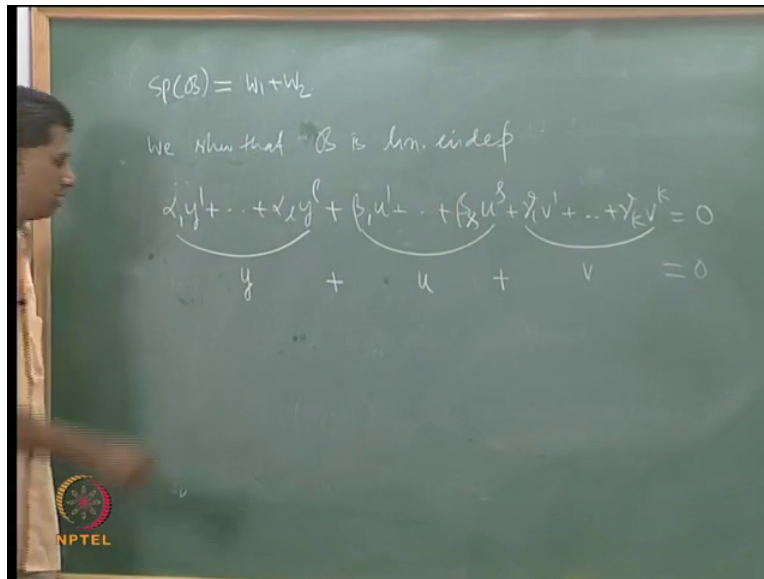

(Refer Slide Time: 42:46)

Suppose this is a basis of  $w_1$  plus  $w_2$  then if script  $b$  is a basis of  $w_1$  plus  $w_2$  then we have the following dimension of  $w_1$  plus  $w_2$  is equal to since this script  $b$  is a basis you observe that it has  $l$  plus  $s$  plus  $k$  vectors so this number will be  $l$  plus  $s$  plus  $k$ .

Now look at dimension  $w_1$  I want to write down dimension  $w_2$  also  $w_1$  has this as a basis,  $w_2$  has this as a basis so  $w_1$  dimension is  $1 + s$   $w_2$  dimension is  $1 + k$  we started with  $w_1$  intersection  $w_2$  dimension  $w_1$  intersection  $w_2$  please refer to the basis that I have there it is  $l$ , so you can see that this number  $1 + s + k$  is this plus this minus this so if I prove that this  $b$  is a basis then I am through, okay this number is this number plus this number minus this that is the right hand side this is a left hand side, okay.

(Refer Slide Time: 44:22)

So we need to prove that  $b$  is a basis that it is a spanning set is easy to see that is as before, so I will not write the fact that I will not prove the fact that span of  $b$  equals  $w_1$  plus  $w_2$  that is easy as before we will only show linear independence, okay we show that  $b$  is linearly independent this spanning thing is as before there is no need to repeat the argument, okay we need to consider

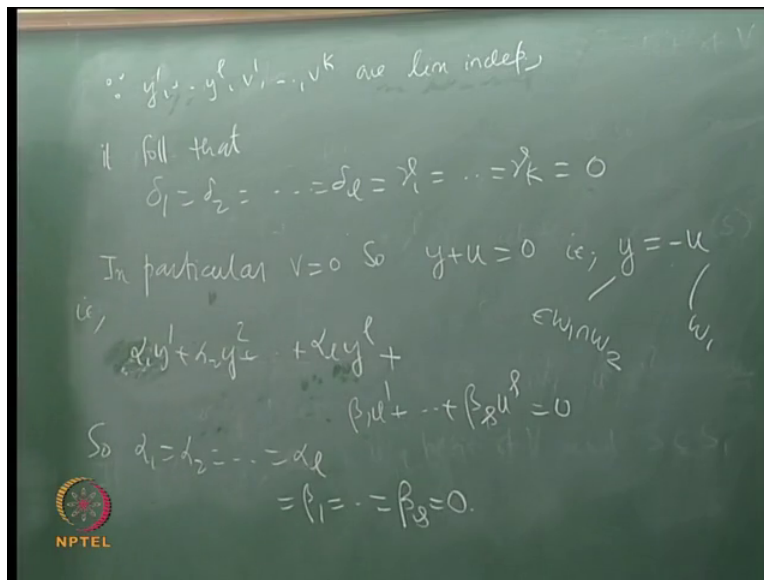

a linear combination then I will call it  $\alpha_1 y_1$  etcetera plus  $\alpha_l y_l$  plus  $\beta_1 u_1$  etcetera plus  $\beta_s u_s$  plus  $\gamma_1 v_1$  etcetera plus  $\gamma_k v_k$  I must equate this to 0 and then show that each of the scalar is 0, okay.

You must show that each of the scalars is 0 so this is what I have as before this is a vector in  $w_1$  intersection  $w_2$  let me call this  $y$  this vector I will call it  $u$  this is in  $w_1$  this is in  $w_2$  I will call this  $v$ ,  $y + u + v = 0$   $y$  is in  $w_1$  intersection  $w_2$  let me write this belongs to  $w_1$  intersection  $w_2$  this belongs to  $w_1$   $u$  is a linear combination of  $u_1$  etcetera  $u_s$  this is in  $w_1$  similarly this is in  $w_2$ , so let me rewrite this as follows  $y + u = -v$   $y + u$  equals minus  $v$   $y + u$  belongs to  $w_1$   $u$  belongs to  $w_1$  so this belongs to  $w_1$   $v$  belongs to  $w_2$  a similar argument as before this belongs to  $w_2$  so  $v$  belongs to  $w_1$  intersection  $w_2$ , is that clear?  $v$  belongs to  $w_1$  intersection  $w_2$   $v$  or minus  $v$   $w_1$  intersection  $w_2$  is a subspace.

Now  $w_1$  intersection  $w_2$  has this as a basis, okay that is this means  $v$  can be written as  $\delta_1 y_1$  etcetera plus  $\delta_l y_l$  because  $y_1, y_2$  etcetera,  $y_l$  is a basis of  $w_1$  intersection  $w_2$  but look at what  $v$  is write down the expanded form of  $v$  this implies I can write this and then equate this or push everything to one side and write this as  $\delta_1 y_1$  etcetera plus  $\delta_l y_l$  minus  $v$  equals 0 that is minus  $\gamma_1 v_1$  minus  $\gamma_2 v_2$  etcetera minus  $\gamma_k v_k$  equals 0, this minus  $v$  equals 0 is what I have written down here but look at this last equation this is a linear combination of  $y_1$  etcetera  $y_l$   $v_1$  etcetera  $v_k$  look at what I have here  $y_1$  etcetera  $y_l$   $v_1$  etcetera  $v_k$  that is a basis they are linearly independent.

(Refer Slide Time: 48:26)

So this equation tells me each of the scalars here is 0, is that okay? Maybe I will use that part, since  $y_1$  etcetera  $y_l$   $v_1$  etcetera  $v_k$  are linearly independent vectors it follows that these scalars  $\delta_1$  equals  $\delta_2$  etcetera equals  $\delta_l$  equals  $\gamma_1$  etcetera equals  $\gamma_k$  equals 0 in particular  $\gamma_1$  etcetera  $\gamma_k$  equals 0 what that means is that  $\gamma_1$  etcetera  $\gamma_k$

each of these scalars is 0 so I go back to this definition of  $v$   $v$  is  $\gamma_1 v_1$  etcetera  $\gamma_k v_k$  so  $v$  is 0 from this  $v$  is 0 then I get the equation  $y + u = 0$ , okay in particular  $v$  is 0 so  $y + u = 0$  that is  $y = -u$   $y$  belongs to  $w_1 \cap w_2$   $u$  belongs to  $w_1$ , so both in particular belong to  $w_1$  write down the equations again you will be able to show that  $y$  as well as  $u$  are 0, okay that is, okay let us we already have the expressions for  $y$  and  $u$  and it follows immediately.

So let me write down this quickly that is I have  $y_1$ , I am sorry what is this scalar  $\alpha_1 y_1 + \alpha_2 y_2$  etcetera plus  $\alpha_1 y_1$  this is  $y + u$  there is no need to go to this plus  $u$ ,  $u$  is what is the scalar for  $u$ ,  $\beta_1 u_1 + \beta_2 u_2$  etcetera plus  $\beta_s u_s = 0$  this is what I have from the equation  $y + u = 0$  but  $y_1, y_2, \dots, y_n, u_1, u_2, \dots, u_s$  they form a basis of  $w_1$  so they are linearly independent so it follows that  $\alpha_1 = \alpha_2 = \dots = \alpha_n = \beta_1 = \beta_2 = \dots = \beta_s = 0$ , I have simply used the definition of  $y$  and  $u$  and the fact that  $y_1, \dots, y_n, u_1, \dots, u_s$  are linearly independent being part of being members of this basis, okay so let me stop with this, this concludes our discussion on vector spaces, subspaces, linear independence, basis, dimension.

From the next lecture onwards I will discuss the notion of linear transformations matrices of linear transformations, properties etcetera.
