Lecture - 38
Solving Recurrence Relations (Part 1)

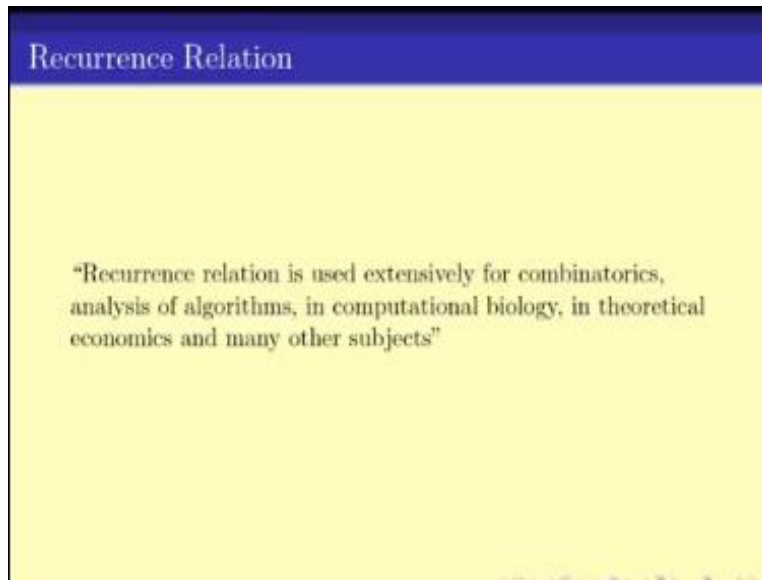

Welcome back. So in the last few lectures, we have seen how to use the recurrence relations to models, various counting problems.

(Refer Slide Time: 00:24)

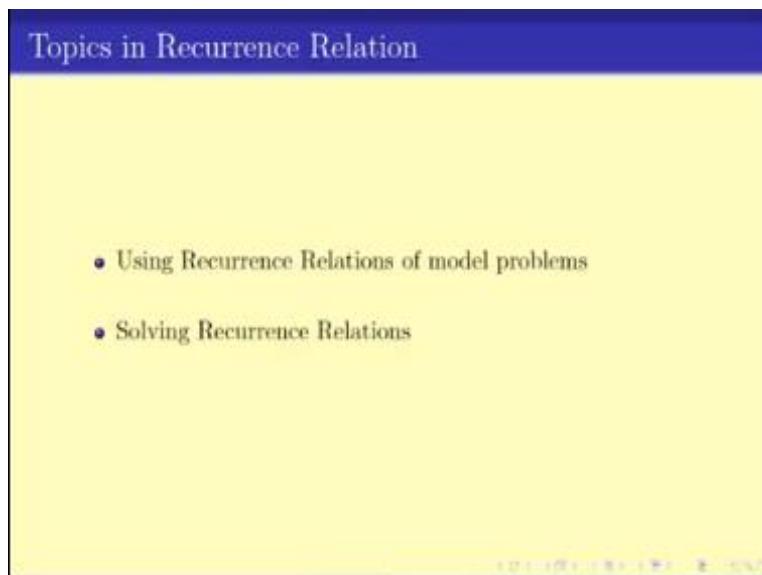

Now, as we have told recurrence relations are very essential part of mathematics or particularly in counting. So in such, recurrence relation is an equation that recursively defines a sequences or multi-dimensional array of the values where they are some use initial terms and the nth term is defined as a the (n) (00:44) terms.

(Refer Slide Time: 00:47)

Recurrence relation is extensively used for combinatorics, analysis of algorithms, in computational biology, in theoretical economics and many other subjects. We have already seen some of recurrence relations.

(Refer Slide Time: 01:05)

And we have seen how recurrence relations can be used to model various problems particularly combinatorics problems. We have not seen how to solve the recurrence relations. In this video, we will be focusing on how to solve recurrence relations. So here some of the recurrence relations that do appear in the real life problems.

(Refer Slide Time: 01:36)

Examples of Recurrence Relations that appear in real problems

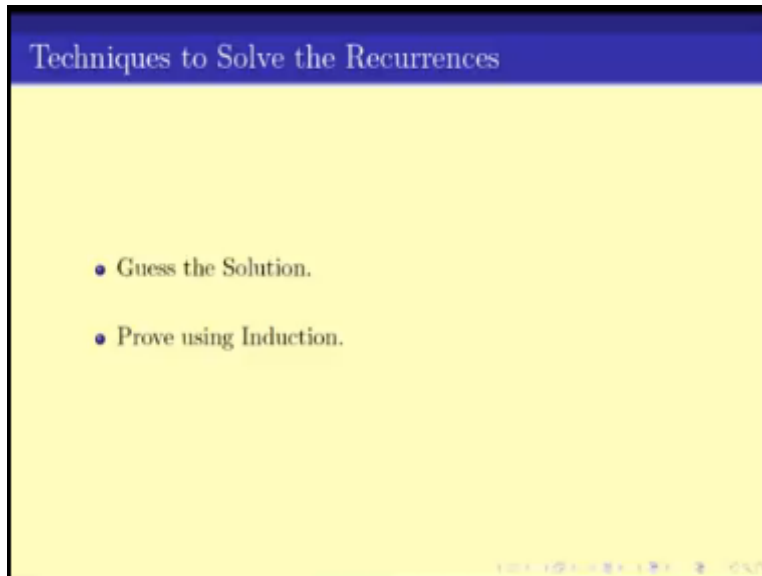

- $T(1) = 1, T(n) = 2 + T(n - 1),$
- $T(1) = 2, T(2) = 3, T(n) = T(n - 1) + T(n - 2).$
- $H(1) = 1, H(2) = 3, H(n) = 2H(n - 1) + 1$
- $F(1) = 1, F(2) = 1, F(n) = F(n - 1) + F(n - 2).$
- $b(1) = 1, b(n) = b(\lceil n/2 \rceil) + 1.$
- $M(1) = 1, M(n) = 2M(\lfloor n/2 \rfloor) + n.$
- $C(1) = 1, C(n + 1) = \sum_{i=0}^n C(i)C(n - i)$

The first one says, T_1 equals to 1 and T_n equals to 2 plus T_{n-1} . The second one say, T_1 equals to 2, T_2 equals to 3 and T_n is equals to T_{n-1} plus T_{n-2} . Or this one is what we got from the Tower of Hanoi problem but H_1 equals to 1, H_2 equals to 3, H_n equals to 2 times H_{n-1} plus 1. This one is basically what we have the Fibonacci series but F_1 equals 1, F_2 equals to 1 and F_n equals to F_{n-1} plus F_{n-2} .

This flow is known as the Fibonacci series quite as same as series that we have this again and again in real life. This one b_1 equals to 1 and b_n equals to $b_{\lceil n/2 \rceil} + 1$. Then we have M_1 equals to 1 and M_n equals to 2 times $M_{\lfloor n/2 \rfloor} + n$. So this 2 appears in various algorithms. Particularly, the binary search algorithm and the merge sort algorithms that are very popular in the algorithm's literature.

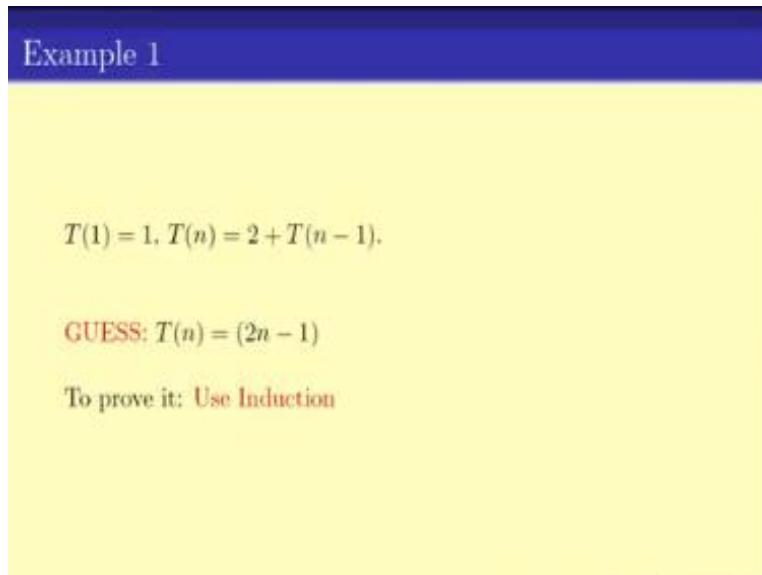

And then we have applied some of complicated one. C_1 equals to 1 and C_{n+1} is equals to submission of i equals to 1 to, 0 to n . $C(i)C_{n-i}$. Now for all of them, we have to now understand how one can solve them. So what is the technique for solving any these recurrences. So how to solve these recurrences.

(Refer Slide Time: 03:46)

Now, the first technique that we have going to look at is the simple thing of guess the solution and prove using induction. In this video, we will see how this technique is useful and then we will - In next video, we will see how one can guess the solution. So say here we have this example.

(Refer Slide Time: 04:14)

T_1 equals to 1, T_n equals to 2 plus T_{n-1} . Now how we solve this particular problem. Now first of all, is somehow magically you can guess this number, then you play. For example, if I tell you, that all guess that T_n equals to $2n - 1$. Now If this is the guess that we made, then we can try to prove this statement using induction. So the technique is first to guess and they are improved by induction. I have kept a big jump of how to guess this number.

We will see that one – see the technique of guessing in the next video as well as in the next whole video. Guessing the solution for the recurrence relation is possibly the most challenging part of solving recurrence relation. But in this video, we will be focusing on how to solve the guess if we have the induction. If we have the guess right. If we guess the thing right, how do you prove? How do you prove by induction?

(Refer Slide Time: 05:39)

Example 1

$T(1) = 1, T(n) = 2 + T(n - 1).$
GUESS: $T(n) = (2n - 1)$

Proof by induction:

✓ Base Case: $n=1$ $T(1) = 1 = 2(1) - 1$

Induction Hypothesis: $T(n) = (2n - 1)$ ←

Inductive Step: To prove $T(n+1) = 2(n+1) - 1 = 2n + 1$

$T(n+1) = 2 + T(n) = 2 + 2n - 1$ [by I.H.]
 $= 2n + 1$ ✓

Hence $T(n) = 2n - 1$ ✓ $\forall n$

Now If you remember, though we should have a base case. In this case, base case is say n equals to 1 and we have, T1 is equals to 1, this is a nothing that is (()) (05:58) which is of course same as T2 times 1 minus 1 right? So this value is correct for T1 right? And now, we have the induction hypothesis, induction hypothesis which says that say for some n Tn equals to 2 times n minus 1.

And in that case, what is the inductive step? Inductive step is to prove the same statement for T(n) plus 1 which is 2 times n plus 1 minus 1 which is 2n plus 1. How do you prove it? Now, of course by the thing that is given to us T of n plus 1 equals to 2 times 2 plus T of n which n equals to 2 plus 2n minus 1 by the - so this is by induction hypothesis which is equals to of course 2n plus 1 and that is what we had to prove. Right? Hence, we are done.

We are proved the inductive step that means T_n equals to $2^n - 1$ which is a for all n greater than or equal to 1. Right? So this is proof by induction for how once we have the guess right. Correct? So let us go over the next one. One more example say, So this example two says that T_1 equals to 1 and T_n equals to n plus T_{n-1} .

Again first of all, you have to guess it and let us imagine that somebody just concept and manages to guess it correctly and say that somebody concept says that T_n equals to n into n plus 1 by 2. Now once someone has guessed it, we have to prove it, we have to ensure that the guess is right and to get that is true, we have to again use induction. So like in the earlier case, we have taking prove this on by induction and let us see how we prove it again.

See base case, n equals to 1, of course T_1 equals to 1 which is 1 times 1 plus 1 by 2 right? Which is what so the thing is correct one the guess was the getting equals to 1. Now we have the induction hypothesis, what is this says that T_n equals to T_n sorry T_n equals to n into n plus 1 by 2. Now inductive step, we have to prove that T of n plus 1 is equals to n plus into n plus 2 by 2. Now how do you prove it? Now T of n plus 1 is given as n plus T_{n-1} which is n plus, see n into n plus 1 by 2.

This is by induction hypothesis which is secondly - sorry I made a mistake here. This is not n , this should be n plus 1 right? So, this is also (()) (11:08) T_n equals to n plus T_{n-1} , T_n plus 1, has to be n plus 1 plus T_n . And this is equals to n plus 1 plus the given induction hypothesis which is n into n plus 1 by 2. Now I can take n plus 1 common in that case, I get 1 plus n by 2, so this is 2 plus n by 2 which is of course n plus 1 into n plus 2 by 2 which is what we had to prove.

So we have T of n equals to n into n plus 1 by 2 for all n greater than equal to 1. Again the idea is simple if you can guess the value correctly for T_n , then you can prove what T_n is by induction. Right? Let us see one more example, what can be the various guesses?

(Refer Slide Time: 12:48)

Example: Tower of Hanoi

$$H(1) = 1, H(n) = 1 + 2H(n-1).$$

GUESS: $H(n) = 2^n - 1$

To prove it: Use Induction

So, this is a Tower of Hanoi problem, right, so $T_1 H_1$ equals to 1 and H_n equals to 1 plus H_{n-1} minus 1. Again, we first have to guess it. Now, what is the guess here? The guess is H_n equals to 2 power n minus 1 and again we have to prove this one by induction. Note here that if you guess it wrong, we will not be able to prove it by induction or if you learn, able to prove it periodic.

So thus, only if you guess it right we will be able to prove this statement. There are people who actually come up with these cases by some intuitions of their brain but and there are some techniques also which will help to come up with the correct cases which we will study in next few lectures. But again it for this particular problem, how do we prove this statement?

(Refer Slide Time: 14:10)

Example: Tower of Hanoi

$$H(1) = 1, H(n) = 1 + 2H(n-1).$$

GUESS: $H(n) = 2^n - 1$

Proof by induction:

base case: $n=1$. $H(1) = 2^1 - 1 = 1$ ✓

Induction Hypothesis: $H(n) = 2^n - 1$

Induction step: To prove $H(n+1) = 2^{n+1} - 1$

$$\begin{aligned} H(n+1) &= 1 + 2H(n) = 1 + 2(2^n - 1) \text{ [by I.H.]} \\ &= 1 + 2^{n+1} - 2 = 2^{n+1} - 1 \quad \checkmark \end{aligned}$$

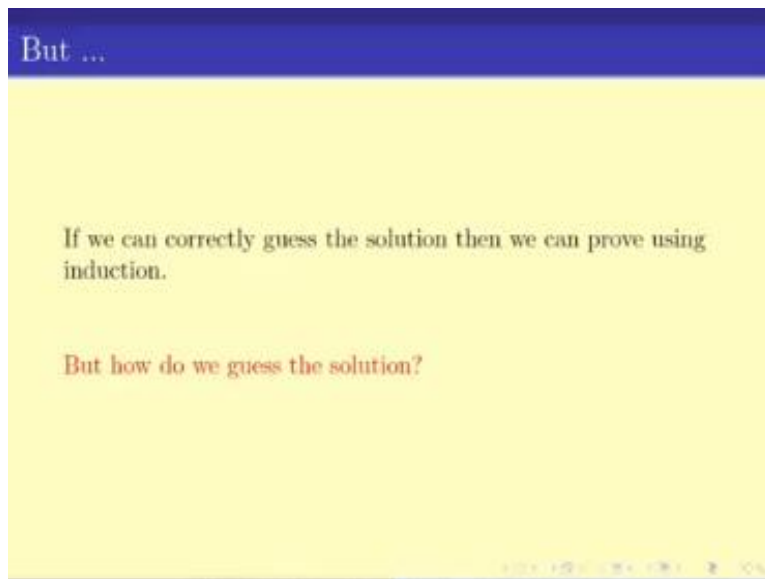

$$H(n) = 2^n - 1 \quad \forall n \geq 1.$$

Again and again, we have to look at the base case, so base case n equals to 1. So here, H_1 equals to 1 which is $2^1 - 1$ which is 1 which is right. So base is correct. So induction hypothesis says H_n equals to $2^n - 1$, inductive step, so we have to prove, so to prove, H_{n+1} equals to $2^{n+1} - 1$. Now let us see, H_{n+1} equals to sorry, H_{n+1} equals to by (1) (15:04) $2 \times H_n + 1$ which is $1 + 2 \times (2^n - 1) + 1$.

This is again by induction hypothesis which is $1 + 2 \times (2^n - 1) + 1$ which is $2 \times 2^n - 2 + 2$ which is 2×2^n plus 1 minus 1 and this is what we had to prove. So H_n equals to $2^n - 1$ for all n greater than or equal to 1. Note that, this is not only a way to proving the recurrence, this also if you go back to our previous video, this gives a compact form for the number of moves required for the Tower of Hanoi problem.

So the Tower of Hanoi problem, therefore requires $2^n - 1$ moves and we got by first modelling it as a recurrence relation and then solve the recurrence relation. Now how did you solve the recurrence relation, we first guess the recurrence relation and then we prove that the guess is right.

(Refer Slide Time: 15:04)

This is how most of the counting problems work, you first model it a recurrence relation and then you solve the recurrence relation. But this is all the (1) (16:41) fine, if you can guess the recurrence relations correctly. You first guess the recurrence relation then prove it using

induction. The main question is how do you guess the solution? and we will be doing this problem and how to guessing the solution to the recurrence relation in the next video.

We will see one of the techniques and then the next few videos we will see the other techniques.

Thank you.
