Problem Session

(Refer Slide Time: 00:25)

Problem 1: Let $n > 1$ and suppose $c_0 > c_1 > \dots > c_n > 0$ be real numbers and let $p(z) = c_0 + c_1 z + \dots + c_n z^n$. Then prove that there does not exist a root of p whose absolute value does not exceed 1.

Solution: We want to show that if $p(z_0) = 0$ for some $z_0 \in \mathbb{C}$, then $|z_0| > 1$.

PROBLEM 1. Let $n > 1$ and suppose $c_0 > c_1 > \dots > c_n > 0$ be real numbers and let $p(z) = c_0 + c_1 z + \dots + c_n z^n$. Then prove that there does not exist a root of p whose absolute value does not exceed 1.

SOLUTION 1. We want to show that if $p(z_0) = 0$ for some $z_0 \in \mathbb{C}$, then $|z_0| > 1$.

Consider the polynomial $(1 - z)p(z)$,

$$\begin{aligned}(1 - z)p(z) &= (c_0 + c_1z + \cdots + c_nz^n) - (c_0z + \cdots + c_nz^{n+1}) \\ &= c_0 + (c_1 - c_0)z + \cdots + (c_n - c_{n-1})z^n - c_nz^{n+1} \\ &= c_0 - ((c_0 - c_1)z + \cdots + (c_{n-1} - c_n)z^n + c_nz^{n+1}).\end{aligned}$$

Then note that all the coefficients of the terms inside the parentheses are positive numbers.

Let $z_0 \in \mathbb{C}$ such that $p(z_0) = 0$. Then we want to prove that $|z_0| > 1$. We may consider the case when z_0 is in the unit disc, $|z_0| \leq 1$

(Refer Slide Time: 05:50)

$$\text{Let } z_0 \in \mathbb{C} \text{ s.t. } p(z_0) = 0$$

$$\begin{aligned}|c_0| &= |(c_0 - c_1)z_0 + \cdots + (c_{n-1} - c_n)z_0^n + c_nz_0^{n+1}| \\ &= |z_0| (|(c_0 - c_1) + \cdots + (c_{n-1} - c_n)z_0^{n-1} + c_nz_0^n|)\end{aligned}$$

$$\leq |z_0| (|c_0 - c_1| + |(c_2 - c_1)z_0| + \cdots + |(c_{n-1} - c_n)z_0^{n-1}| + |c_nz_0^n|)$$

$$\leq |z_0| (c_0 - c_1 + (c_2 - c_1))$$

$$\begin{aligned}
c_0 = |c_0| &= |(c_0 - c_1)z_0 + \cdots + (c_{n-1} - c_n)z_0^{n-1} + c_n z_0^n| \\
&= |z_0| (|(c_0 - c_1) + \cdots + (c_{n-1} - c_n)z_0^{n-1} + c_n z_0^n|) \\
&\leq |z_0| (|(c_0 - c_1)| + \cdots + |(c_{n-1} - c_n)z_0^{n-1}| + |c_n z_0^n|) \\
&= |z_0| ((c_0 - c_1) + \cdots + (c_{n-1} - c_n)|z_0^{n-1}| + c_n |z_0^n|) \\
&\leq (c_0 - c_1) + (c_2 - c_1) + \cdots + (c_{n-1} - c_n) + c_n \\
&= c_0
\end{aligned}$$

Since we started with c_0 and ended with c_0 , all the inequalities in the above equations will be equalities.

(Refer Slide Time: 10:31)

Therefore, we have

$$\begin{aligned}
|z_0| & \left| (c_0 - c_1) + (c_2 - c_1)z_0 + \cdots + (c_{n-1} - c_n)z_0^{n-1} + c_n z_0^n \right| \\
&= |z_0| (|c_0 - c_1| + |(c_2 - c_1)z_0| + \cdots + |(c_{n-1} - c_n)z_0^{n-1}| + |c_n z_0^n|)
\end{aligned}$$

If $z_0 = 0$, then $P(z_0) = 0 \Rightarrow c_0 = 0$ (a contradiction)

Hence

$$|(c_0 - c_1) + (c_2 - c_1)z_0 + \cdots + (c_{n-1} - c_n)z_0^{n-1} + c_n z_0^n| = |c_0 - c_1| + |(c_2 - c_1)z_0| + \cdots$$

Therefore, we have

$$|z_0| \left(|(c_0 - c_1) + \cdots + (c_{n-1} - c_n)z_0^{n-1} + c_n z_0^n| \right) = |z_0| \left(|(c_0 - c_1)| + \cdots + |(c_{n-1} - c_n)z_0^{n-1}| + |c_n z_0^n| \right)$$

If $z_0 = 0$, then $p(z_0) = 0 \implies c_0 = 0$, which is a contradiction. Hence $z_0 \neq 0 \implies$

$$\left(|(c_0 - c_1) + \cdots + (c_{n-1} - c_n)z_0^{n-1} + c_n z_0^n| \right) = \left(|(c_0 - c_1)| + \cdots + |(c_{n-1} - c_n)z_0^{n-1}| + |c_n z_0^n| \right)$$

(Refer Slide Time: 12:53)

If $z_0 = 0$, then $p(z_0) = 0 \implies c_0 = 0$ (a contradiction)

Hence

$$|(c_0 - c_1) + (c_2 - c_1)z_0 + \cdots + (c_{n-1} - c_n)z_0^{n-1} + c_n z_0^n| = |c_0 - c_1| + |(c_2 - c_1)z_0| + \cdots$$

Prove using C-S that if $|a+b| = |a| + |b|$,
then $a = \lambda b$ for $\lambda \in \mathbb{R}$.

By an induction argument

$$(c_0 - c_1) = \lambda (c_2 - c_1) z_0$$

NPTEL

74 / 84

Reader should verify using Cauchy-Schwarz inequality that if $|a+b| = |a| + |b|$, then $a = \lambda b$ for $\lambda \in \mathbb{R}$.

Then, by an induction argument that reader should verify,

(Refer Slide Time: 14:44)

$\neg$ c_0 $\overline{\lambda(c_2 - c_1)}$ $\in \mathbb{R}$

Notice that if $z_0 > 0$, then

$$p(z_0) = c_0 + (c_1 z_0 + \dots + c_n z_0^n) \geq c_0 \neq 0$$

Hence z_0 cannot be a root.

If $z_0 < 0$, $z_0 = -a$ where $a > 0$
 If n is odd,

$$p(z_0) = \frac{(c_0 - c_1 a)}{>0} + \frac{a^2(c_2 - c_3 a)}{>0} + \dots + \frac{a^{n-1}(c_{n-1} - c_n a)}{>0}$$

$$\Rightarrow p(z_0) > 0$$

75 / 84

for $\lambda \in \mathbb{R}$, $(c_0 - c_1) = \lambda(c_2 - c_1)z_0 \Rightarrow z_0 = \frac{c_0 - c_1}{\lambda(c_2 - c_1)} \in \mathbb{R}$.

Note that if $z_0 > 0$, then $p(z_0) = c_0 + c_1 z_0 + \dots + c_n z_0^n \geq c_0 \neq 0$. Hence z_0 cannot be root.

If $z_0 < 0$, $z_0 = -a$, $a > 0$.

If n is odd, $p(z_0) = (c_0 - c_1 a) + a^2(c_2 - c_3 a) + \dots + a^{n-1}(c_{n-1} - c_n a)$, then each term inside the parentheses of the sum on RHS is positive. Hence in this case also $p(z_0) > 0$.

If n is even, $p(z_0) = (c_0 - c_1 a) + a^2(c_2 - c_3 a) + \dots + a^{n-2}(c_{n-2} - c_{n-1} a) + a^n c_n$, then here also each term inside the parentheses of the sum on RHS is positive $\Rightarrow p(z_0) \neq 0$.

Hence we have proved that if $|z_0| \leq 1 \Rightarrow p(z_0) \neq 0$.

PROBLEM 2. Let $z, w \in \mathbb{C}$ such that $(1 + |z|^2)w = (1 + |w|^2)z$. Then either $z = w$ or $z\bar{w} = 1$.

SOLUTION 2. We know that $|z|^2 = z\bar{z}$. Then,

$$(1 + |z|^2)w = (1 + |w|^2)z$$

$$w + z\bar{z}w = z + w\bar{w}z$$

$$w(1 - \bar{w}z) = z(1 - \bar{z}w).$$

If $z = 0 \implies w = 0$, hence $z = w$.

Suppose $z \neq 0$ and $z\bar{w} \neq 1$, then

$$\frac{w}{z} = \frac{(1 - \bar{z}w)}{(1 - \bar{w}z)} \implies \left| \frac{w}{z} \right| = \left| \frac{1 - \bar{z}w}{1 - \bar{w}z} \right| = \frac{|1 - \bar{z}w|}{|1 - \bar{w}z|} = 1 \implies |w| = |z| \implies (1 + |w|^2) = (1 + |z|^2).$$

$$\text{Hence } (1 + |w|^2)z = (1 + |z|^2)w \implies z = w.$$

(Refer Slide Time: 25:46)

Definition: A path γ from z to w is a polygonal

if $\exists z_0 = z, z_1, \dots, z_{n-1}, z_n = w \in \mathbb{C}$ s.t

$$\gamma = \gamma_{z_0, z_1} \cdot \gamma_{z_1, z_2} \cdots \gamma_{z_{n-1}, z_n} \quad \text{where}$$

$$\gamma_{z_i, z_{i+1}}(s) = (1-s)z_i + sz_{i+1}.$$

NPTEL

78 / 84

DEFINITION 3. A path γ from z to w is a polygonal if $\exists z = z_0, z_1, \dots, z_{n-1}, z_n = w \in \mathbb{C}$ such that $\gamma = \gamma_{z_0, z_1} \cdot \gamma_{z_1, z_2} \cdots \gamma_{z_{n-1}, z_n}$ where $\gamma_{z_i, z_{i+1}}(s) = (1-s)z_i + sz_{i+1}$.

That is polygonal path between two points in the complex plane is obtained by concatenating straight line paths between finite number of points.

(Refer Slide Time: 29:18)

Problem: Let $\Omega \subseteq \mathbb{C}$ be a connected open set. Then prove that given $z, w \in \Omega$, $\exists$ a polygonal path from z to w consisting of straight lines parallel to the real or imaginary axis.

NPTEL

79 / 84

PROBLEM 3. Let $\Omega \subseteq \mathbb{C}$ be a connected open set. Then prove that given $z, w \in \Omega$, $\exists$ a polygonal path from z to w consisting of straight lines parallel to the real or imaginary axis.

(Refer Slide Time: 30:56)

If $z_0 = a_0 + b_0 i$ & $z = a + bi$
 let z' be the pt. $a + b_0 i$

Then $\gamma_{z_0 z'}(s) = (1-s)z_0 + s z'$ (parallel to the real axis)
 $\gamma_{z' z}(s) = (1-s)z' + s z$ (" " imaginary axis)
 Define $\gamma = \gamma_{z_0 z'} \cdot \gamma_{z' z}$
 Hence the

80 / 84

SOLUTION 4. Suppose $z_0 \in \mathbb{C}$ and $r > 0$. Then we shall first prove that $D(z_0, r)$ satisfies the given condition.

If $z'_0 = a_0 + i b_0$ and $z = a + i b$ be two points inside $D(z_0, r)$. Let $z'' = a + i b_0 \in D(z_0, r)$. (Reader is strongly suggested to draw a picture with given details to get a good idea.)

$$\gamma_{z'_0, z''}(s) = (1-s)z'_0 + s z'' \text{ (parallel to real axis)}$$

$$\gamma_{z'', z}(s) = (1-s)z'' + s z \text{ (parallel to imaginary axis)}$$

Define $\gamma = \gamma_{z'_0, z''} \cdot \gamma_{z'', z}$, then γ will be a polygonal path from z'_0 to z with desired condition.

(Refer Slide Time: 36:10)

Hence the the Disc $D(z_0, r)$ satisfies the conclusion of the problem.

Fix $z_0 \in \Omega$.

Define $A = \{z \in \Omega : z \text{ can be joined to } z_0 \text{ by a polygonal path parallel to the axes}\}$

Exercise: Prove that A is both open & closed.

Since $z_0 \in A$, we have $A = \Omega$. — $\blacksquare$.

Hence the disc $D(z_0, r)$ satisfies the condition of the problem.

Now, fix $z_0 \in \Omega$, define $A = \{z \in \Omega : z \text{ can be joined to } z_0 \text{ by a polygonal path parallel to axes}\}$. Now it is left to reader to verify that A is both open and closed. Since $z_0 \in A \implies A \neq \emptyset \implies A = \Omega$, as Ω is connected.

(Refer Slide Time: 38:28)

Since $z_0 \in A$, we have $A = \Omega$. $\square$

Definition: A function $f: X \rightarrow Y$ is said to be a closed map if $f(C)$ is closed in Y whenever C is closed in X .

DEFINITION 5. Let X, Y be metric spaces. A function $f: X \rightarrow Y$ is said to be a closed map if $f(C)$ is closed in Y whenever C is closed in X .

PROBLEM 4. Let $f: X \rightarrow Y$ be a continuous mapping from a compact metric space to another metric space. Then f is a closed map.

(Refer Slide Time: 40:30)

space. Then f is a closed map.

Proof: Let $E \subset X$ be a closed set.
Since X is compact, E is compact.

Claim: $f(E)$ is compact.

Let $\mathcal{U} = \{U_\alpha\}_{\alpha \in A}$ be an open cover of $f(E)$.

Define $\mathcal{V} := \{f^{-1}(U_\alpha)\}_{\alpha \in A}$

SOLUTION 6. Let $E \subset X$ be a closed subset of X . Since X is compact, E is compact.

Claim: $f(E)$ is compact.

Let $\mathcal{U} = \{U_\alpha\}_{\alpha \in A}$ be an open cover of $f(E)$. Define $\mathcal{V} := \{f^{-1}(U_\alpha)\}_{\alpha \in A}$, then $\mathcal{V}$ is an open cover of E .

(Refer Slide Time: 42:14)

Let $\mathcal{U} = \{U_\alpha\}_{\alpha \in A}$ be an open cover of $f(E)$.

Define $\mathcal{V} := \{f^{-1}(U_\alpha)\}_{\alpha \in A}$ is an open cover of E

Complete the proof of claim

Hence $f(E)$ is a compact subset of Y and hence closed. □

Now it is left as an exercise to reader to conclude that $f(E)$ is also compact. Then $f(E)$ is compact in $Y \implies f(E)$ is closed.

THEOREM 5 (Heine-Borel). A subset $K \subseteq \mathbb{R}^n$ is compact if and only if K is closed and bounded in $\mathbb{R}^n$.

PROOF. ($\implies$) Let K be compact, then K is closed. Consider $\mathcal{U} = (B(0, n))_{n \in \mathbb{N}}$. Then $\mathcal{U}$ is an open cover of K . Since K is compact, $\exists n \in \mathbb{N}$ such that

$$K \subset B(0, 1) \cup \dots \cup B(0, n)$$

. Hence K is bounded.

($\Leftarrow$) Assume that K is closed and bounded.

(Refer Slide Time: 47:26)

($\Leftarrow$) Assume that K is closed and bounded.

$$K - \text{bounded} \Rightarrow K \subset \underbrace{[a_1, b_1] \times \cdots \times [a_n, b_n]}_{\text{closed subset of } \mathbb{R}^n}.$$

Claim: $[a, b]$ is sequentially

K is bounded $\Rightarrow K \subset [a_1, b_1] \times \cdots \times [a_n, b_n]$.

Claim: $[a, b]$ is sequentially compact.

(Refer Slide Time: 49:14)

Claim: $[a, b]$ is sequentially compact

Let $\{x_n\}$ be a sequence in $[a, b]$

Then $\exists$ a subsequence converging to
the $\sup(A)$ where $A = \{x_n : n \in \mathbb{N}\}$.

Claim : $[a, b] \times [c, d]$ is sequentially compact.

Let $\{x_n\}_{n \in \mathbb{N}}$ be a sequence in $[a, b]$. Let $A = \{x_n : n \in \mathbb{N}\}$, then $\exists$ a subsequence converging to $\sup(A)$ by using Bolzano- Weierstrass theorem. Since $[a, b]$ is a closed set, supremum will belong $[a, b]$. Hence $[a, b]$ is sequentially compact.

Claim: $[a, b] \times [c, d]$ is sequentially compact.

Let $\{(x_n, y_n)\}_{n \in \mathbb{N}}$ be a sequence in $[a, b] \times [c, d]$. Let $\{x_{n_k}\}_{k \in \mathbb{N}}$ be a convergent subsequence of $\{x_n\}_{n \in \mathbb{N}}$ in $[a, b]$, whose existence is obtained by above claim. Similarly, let $\{y_{n_k}\}_{k \in \mathbb{N}}$ be a convergent subsequence of $\{y_n\}_{n \in \mathbb{N}}$ in $[c, d]$.

(Refer Slide Time: 53:18)

Now consider the sequence $\{y_{n_k}\}_{k \in \mathbb{N}}$ in $[c, d]$

By going to a further ^{convergent subseq} subseq. of $\{y_{n_k}\}_{k \in \mathbb{N}}$ given by $\{y_{n_{k_\ell}}\}_{\ell \in \mathbb{N}}$ we obtain a subsequence $\{x_{n_{k_\ell}}, y_{n_{k_\ell}}\} \rightarrow \{\lim x_{n_{k_\ell}}, \lim y_{n_{k_\ell}}\}$

By induction $[a_1, b_1] \times \cdots \times [a_n, b_n]$ is compact.

————— $\square$.

Now we obtain a subsequence $\{(x_{n_k}, y_{n_k})\}_{k \in \mathbb{N}}$ of $\{(x_n, y_n)\}_{n \in \mathbb{N}}$. Hence $[a, b] \times [c, d]$ is also sequentially compact.

By induction $[a_1, b_1] \times \cdots \times [a_n, b_n]$ is also sequentially compact. We know that in a metric space sequentially compactness coincides with compactness, hence $[a_1, b_1] \times \cdots \times [a_n, b_n]$ is compact set. Since K is a closed subset of a compact set, K is also compact.

$\square$
