## **Convolution of Distribution - Part 3**

(Refer Slide Time: 00:18)

So, we had  $T, S \in D'(\mathbb{R}^N)$  at least one of them with compact support. Then we define  $T * S \in D'(\mathbb{R}^N)$  which is characterized by the following conditions :

$$(T * S)(\varphi) = (T * (S * \varphi^v))(0)$$

$$(T * S) * \varphi = T * (S * \varphi)$$

and both these for all  $\varphi \in D(\mathbb{R}^N)$ . So, either of these we will verify, we will characterize  $T$  star it is a unique one.

So, now, we want to show that this convolution has all the properties with functions and therefore, we have the following theorem. So,  $T_1$  and  $T_2$  distributions on  $\mathbb{R}^N$  at least one with compact support then

$$(i) \quad T_1 * T_2 = T_2 * T_1$$

(ii)  $T_1$  and  $T_2$  as the above. Then

$$\text{supp}(T_1 * T_2) \subset \text{supp}(T_1) + \text{supp}(T_2).$$

(iii)  $T_1, T_2, T_3 \in D'(\mathbb{R}^N)$  at least 2 of them with compact support. Then

$$T_1 * (T_2 * T_3) = (T_1 * T_2) * T_3$$

(iv)  $T_1, T_2 \in D'(\mathbb{R}^N)$  as in (i)  $\alpha$  any multi-index. Then

$$D^\alpha (T_1 * T_2) = D^\alpha T_1 * T_2 = T_1 * D^\alpha T_2.$$

So, you can push the derivative wherever you like.

(Refer Slide Time: 04:44)

Prf: (i) let  $\varphi_1, \varphi_2 \in \mathcal{D}(\mathbb{R}^N)$  arbitrary.

$$\begin{aligned} (T_1 + T_2) * (\varphi_1 + \varphi_2) &= T_1 * (\varphi_1 + \varphi_2) + T_2 * (\varphi_1 + \varphi_2) \\ &= T_1 * (\varphi_1 + \varphi_2) + T_2 * (\varphi_1 + \varphi_2) \\ &= T_1 * (\varphi_1 + \varphi_2) + T_2 * (\varphi_1 + \varphi_2) \\ &= (T_1 + T_2) * (\varphi_1 + \varphi_2). \end{aligned}$$

$$\begin{aligned} \text{Similarly } (T_1 + T_2) * (\varphi_1 + \varphi_2) &= (T_1 + T_2) * (\varphi_1 + \varphi_2) \\ &= (T_1 + T_2) * (\varphi_1 + \varphi_2) = (T_1 + T_2) * (\varphi_1 + \varphi_2). \end{aligned}$$

$$\begin{aligned} (T_1 + T_2) * (\varphi_1 + \varphi_2) &= (T_1 + T_2) * (\varphi_1 + \varphi_2) \\ &= (T_1 + T_2) * (\varphi_1 + \varphi_2) = (T_1 + T_2) * (\varphi_1 + \varphi_2). \end{aligned}$$

$$\begin{aligned} (T_1 + T_2) * (\varphi_1 + \varphi_2) &= (T_1 + T_2) * (\varphi_1 + \varphi_2) \\ &= (T_1 + T_2) * (\varphi_1 + \varphi_2) = (T_1 + T_2) * (\varphi_1 + \varphi_2). \end{aligned}$$

NPTEL

$$\begin{aligned} \text{Similarly } (T_1 + T_2) * (\varphi_1 + \varphi_2) &= (T_1 + T_2) * (\varphi_1 + \varphi_2) \\ &= (T_1 + T_2) * (\varphi_1 + \varphi_2) = (T_1 + T_2) * (\varphi_1 + \varphi_2). \end{aligned}$$

$$\begin{aligned} (T_1 + T_2) * (\varphi_1 + \varphi_2) &= (T_1 + T_2) * (\varphi_1 + \varphi_2) \\ &= (T_1 + T_2) * (\varphi_1 + \varphi_2) = (T_1 + T_2) * (\varphi_1 + \varphi_2). \end{aligned}$$

$$\begin{aligned} (T_1 + T_2) * (\varphi_1 + \varphi_2) &= (T_1 + T_2) * (\varphi_1 + \varphi_2) \\ &= (T_1 + T_2) * (\varphi_1 + \varphi_2) = (T_1 + T_2) * (\varphi_1 + \varphi_2). \end{aligned}$$

$$\begin{aligned} (T_1 + T_2) * (\varphi_1 + \varphi_2) &= (T_1 + T_2) * (\varphi_1 + \varphi_2) \\ &= (T_1 + T_2) * (\varphi_1 + \varphi_2) = (T_1 + T_2) * (\varphi_1 + \varphi_2). \end{aligned}$$

NPTEL

So, now let us give a proof of these properties which mirror the properties of convolution of functions. So, first one, so let  $\varphi_1, \varphi_2 \in D(\mathbb{R}^N)$  arbitrary. So, let us take  $(T_1 * T_2) * (\varphi_1 * \varphi_2)$ . So, this again an infinity functions with compact support. So, therefore, we know you have 2 functions 2 distributions 1 of them compact support and c infinity functions with compact support. So, we have proved this theorem

$$= T_1 * (T_2 * (\varphi_1 * \varphi_2))$$

$$= T_1 * ((T_2 * \varphi_1) * \varphi_2)$$

Again, we have shown this when you have 2 with compact support and 1 is a distribution So, you have this, so you have distribution into functions compact support, so once again I am using the theorem. Now, this is equal to

$$= T_1 * (\varphi_2 * (T_2 * \varphi_1))$$

I am just using the commutativity of the convolution of functions.

Now, so now, I want suppose  $T_2$  has compact support then this has  $T_2 * \varphi_1$  will also have compact support we have seen that and this has compact support, so we can use the associativity law. If  $T_1$  has compact support then you have again  $\varphi_2$  has compact support and this is the c infinity function once again we have used we had the second theorem which we proved that can be used and therefore, this can be written as  $T_1 * ((T_2 * \varphi_1) * \varphi_2)$  using the 2 preceding theorems.

Similarly,

$$(T_2 * T_1) * (\varphi_1 * \varphi_2) = (T_1 * T_2) * (\varphi_1 * \varphi_2)$$

. And now going by what went, you have first with the second and second with the first. So, this is

$$= (T_2 * \varphi_1) * (T_1 * \varphi_2)$$

$$= (T_1 * \varphi_2) * (T_2 * \varphi_1)$$

So, these 2 are equal, so we have

$$(T_1 * T_2) * (\varphi_1 * \varphi_2) = (T_2 * T_1) * (\varphi_1 * \varphi_2)$$

And now, this is

$$((T_1 * T_2) * \varphi_1) * \varphi_2 = ((T_2 * T_1) * \varphi_1) * \varphi_2$$

But then by the fourth part of the first one that is if

$$T * \varphi = 0 \text{ for all } \varphi \in D(\mathbb{R}^N) \text{ then } T = 0.$$

So, this is a very important thing. So, I can cancel this, and so you get

$$(T_1 * T_2) * \varphi_1 = (T_2 * T_1) * \varphi_1$$

this is for all  $\varphi_1, \varphi_2$  and this is for all  $\varphi_1$ .

Again, this is true for all  $\varphi_1$  and therefore, I can once more cancel it and so, I will get

$$T_1 * T_2 = T_2 * T_1$$

So, this proves the first part

(Refer Slide Time: 09:03)

$$(T_1 + T_2) * \phi_1 = (T_1 * T_2) * \phi_1 \quad \forall \phi_1$$

$$T_1 * T_2 = T_2 * T_1.$$

---

(ii) By (i) we assume  $T_2$  has cft. supp

$$\phi \in \mathcal{D}(\mathbb{R}^N) \quad (T_1 * T_2)(\phi) = (T_1 * (T_2 * \phi))(0).$$

$$= T_1((T_2 * \phi)^v).$$

$$\text{Supp } (T_2 * \phi)^v \subset \text{supp } T_2 - \text{supp } \phi.$$

By  $\text{Supp } T_1 \cap (\text{supp } \phi - \text{supp } T_2) = \emptyset \Rightarrow (T_1 * T_2)(\phi) = 0$

$$\Rightarrow T_1 + T_2 \text{ vanishes on the complement of } \text{supp } T_1 + \text{supp } T_2.$$

$$\Rightarrow \text{Supp } (T_1 * T_2) \subset \text{Supp } T_1 + \text{Supp } T_2.$$

**Prof. S. Kesavan**  
Department of Mathematics  
The Institute of Mathematical Sciences

$$\phi \in \mathcal{D}(\mathbb{R}^N) \quad (T_1 * T_2)(\phi) = 0$$

$$\Rightarrow T_1 + T_2 \text{ vanishes on the complement of } \text{supp } T_1 + \text{supp } T_2.$$

$$\Rightarrow \text{Supp } (T_1 * T_2) \subset \text{Supp } T_1 + \text{Supp } T_2.$$

---

(iii) Assume  $T_3$  has cft. supp  $\phi \in \mathcal{D}(\mathbb{R}^N)$

$$(T_1 * (T_2 * T_3)) * \phi = T_1 * ((T_2 * T_3) * \phi) = T_1 * (T_2 * (T_3 * \phi))$$

$$(T_1 + T_2) * T_3 * \phi = (T_1 * T_2) * \underbrace{(T_3 * \phi)}_{\text{cft. supp}} = T_1 * T_2 * (T_3 * \phi)$$

Therefore  $\Rightarrow T_1 * (T_2 * T_3) = (T_1 * T_2) * T_3.$

So, the second part, so by 1 without loss of generality assume  $T_2$  has compact support. So, we have  $T_1$  and  $T_2$ . So, if 1 of them has compact support, if you, if  $T_1$  has compact support then  $T_1 * T_2 = T_2 * T_1$ . So, the second 1 you can say always has compact support. Now, if you take any  $\phi \in D(\mathbb{R}^N)$ , then you have the

$$(T_1 * T_2)(\phi) = (T_1 * (T_2 * \phi^v))(0)$$

So, you have, this is  $C^\infty$  function with compact support, this distribution and you are evaluating at 0. So,

$$= T_1((T_2 * \varphi^\vee)^\vee)$$

That is I am just using the definition of the function, the convolution of this distribution and the  $C^\infty$  function with compact support. But what is support of  $T_2 * \varphi$  check,

$$\text{supp}(T_2 * \varphi^\vee) \subset \text{supp}(T_2) - \text{supp}(\varphi)$$

So, if

$$\text{supp}(T_1) \cap (\text{supp}(T_2) - \text{supp}(\varphi)) = \emptyset \Rightarrow (T_1 * T_2)(\varphi) = 0$$

.So, that means, this will be 0 because this has a support which is the minus of this 1. So, we have to take the minus of that, because we have a check support  $\varphi$  to minus support of  $T_2$  because that is the minus of this and therefore, which is the support of  $T_2 * \varphi$  check check and therefore, these 2 are disjoint then this will be 0.

So, this implies that 2 should not be disjoint that means, implies support of  $T_1$  and  $T_2$ . So, the  $T_1 * T_2$  will vanish on the complement of, so this implies  $T_1$  and  $T_2$  vanishes on the complement of support  $T_1$  plus support  $T_2$  from this it follows. And therefore, this means

$$\text{supp}(T_1 * T_2) \subset \text{supp}(T_1) + \text{supp}(T_2)$$

So, that is the second part. So, now, let us take the third one.

So, if  $T_1, T_2, T_3$  two of them have compact support, I already checked that you can define any of those triple operations. So, let us assume, that assume  $T_3$  has compact support, at least 2 of them will have. So, let us assume  $T_3$  is compact support. Let  $\varphi \in D(\mathbb{R}^N)$ . So,

$$(T_1 * (T_2 * T_3)) * \varphi = T_1 * ((T_2 * T_3) * \varphi)$$

Again, I am using the fact that you have 2 distributions and the star, so it is characterised the convolution is characterized this way. And that equal to

$$= T_1 * (T_2 * (T_3 * \varphi))$$

$$((T_1 * T_2) * T_3) * \varphi = (T_1 * T_2) * (T_3 * \varphi) = T_1 * (T_2 * (T_3 * \varphi))$$

And then  $((T_1 * T_2) * T_3) * \varphi$  now the last 1 is possible because  $T_3$  start phi is a infinity function with compact support because phi and  $T_3$  are both having compact support.

So, this has compact support. And therefore, I can use the characterization and so these 2 are equal. So, they are equal for all phi, so this implies true for all phi. So,  $T_1$  star by the cancellation theorem, you have

$$T_1 * (T_2 * T_3) = (T_1 * T_2) * T_3$$

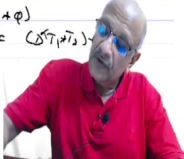

So, what happens if  $T_3$  does not have compact support?

(Refer Slide Time: 15:20)

$T_3$  does not have cft supp, then  $T_1, T_2$  have cft supp.

$$\begin{aligned}
 T_1 * (T_2 * T_3) &= T_1 * (T_3 * T_2) = (T_3 * T_2) * T_1 \quad \text{cft. supp.} \\
 &= T_3 * (T_2 * T_1) \\
 &= (T_2 * T_1) * T_3 = (T_1 * T_2) * T_3.
 \end{aligned}$$

(iv).  $\varphi \in \mathcal{D}(\mathbb{R}^n)$  a any multi-index

$$\begin{aligned}
 \mathcal{D}^*(T_1 * T_2) * \varphi &= (T_1 * T_2) * \mathcal{D}^* \varphi = (T_2 * T_1) * \mathcal{D}^* \varphi \\
 &= T_1 * (T_2 * \mathcal{D}^* \varphi) = T_2 * (T_1 * \mathcal{D}^* \varphi) \\
 &= T_1 * (\mathcal{D}^* T_2 * \varphi) = T_2 * (\mathcal{D}^* T_1 * \varphi) \\
 &= (T_1 * \mathcal{D}^* T_2) * \varphi = (T_2 * \mathcal{D}^* T_1) * \varphi = (\mathcal{D}^* T_1 * T_2) * \varphi
 \end{aligned}$$

$$\begin{aligned}
 T_1 * (T_2 * T_3) &= T_1 * (T_3 * T_2) = (T_3 * T_2) * T_1 \quad \text{cft. supp.} \\
 &= T_3 * (T_2 * T_1) \\
 &= (T_2 * T_1) * T_3 = (T_1 * T_2) * T_3.
 \end{aligned}$$

(iv).  $\varphi \in \mathcal{D}(\mathbb{R}^n)$  a any multi-index

$$\begin{aligned}
 \mathcal{D}^*(T_1 * T_2) * \varphi &= (T_1 * T_2) * \mathcal{D}^* \varphi = (T_2 * T_1) * \mathcal{D}^* \varphi \\
 &= T_1 * (T_2 * \mathcal{D}^* \varphi) = T_2 * (T_1 * \mathcal{D}^* \varphi) \\
 &= T_1 * (\mathcal{D}^* T_2 * \varphi) = T_2 * (\mathcal{D}^* T_1 * \varphi) \\
 &= (T_1 * \mathcal{D}^* T_2) * \varphi = (T_2 * \mathcal{D}^* T_1) * \varphi = (\mathcal{D}^* T_1 * T_2) * \varphi
 \end{aligned}$$

$$\Rightarrow \mathcal{D}^*(T_1 * T_2) = T_1 * \mathcal{D}^* T_2 = \mathcal{D}^* T_1 * T_2$$

Now, we use the commutativity  $T$  if  $T_3$  does not have compact support then  $T_1$  and  $T_2$  have compact support. So, we get

$$T_1 * (T_2 * T_3) = T_1 * (T_3 * T_2) = (T_3 * T_2) * T_1$$

by the commutativity this equal to  $T_3$  start  $T_1$ . Now,  $T_1$  has compact support and therefore, by the first part of this, of this section, so you have this and that proves the whole thing.

So, now 4, so  $\varphi \in D(\mathbb{R}^N)$  and  $\alpha$  any multi-index, so then again we will use the cancellation

$$\begin{aligned}
 D^\alpha(T_1 * T_2) * \varphi &= (T_1 * T_2) * D^\alpha \varphi = (T_2 * T_1) * D^\alpha \varphi \\
 &= T_1 * (T_2 * D^\alpha \varphi) = T_2 * (T_1 * D^\alpha \varphi) \\
 &= T_1 * (D^\alpha T_2 * \varphi) = T_2 * (D^\alpha T_1 * \varphi) \\
 &= (T_1 * D^\alpha T_2) * \varphi = (T_2 * D^\alpha T_1) * \varphi = (D^\alpha T_1 * T_2) * \varphi \\
 \Rightarrow D^\alpha(T_1 * T_2) &= T_1 * D^\alpha T_2 = D^\alpha T_1 * T_2
 \end{aligned}$$

So, this proves the (18:51).

(Refer Slide Time: 19:00)

Thm.  $T \in \mathcal{T}'(\mathbb{R}^N)$   $\delta = \text{Dirac dist.}^\circ$  (concentrated at the origin).

Then  $T = \delta * T = T * \delta$

$\alpha$  any multi-index  $D^\alpha T = (D^\alpha \delta) * T$ .

Pr.  $\varphi \in \mathcal{D}(\mathbb{R}^N)$ .

$(\delta * \varphi)(x) = \delta(\underline{x} * \check{\varphi}) = (\underline{x} * \check{\varphi})(0) = \check{\varphi}(-x) = \varphi(x)$

$\delta * \varphi = \varphi$ .

$(T * \delta) * \varphi = T * (\delta * \varphi) = T * \varphi$

$\Rightarrow T * \delta = T$

||

$\delta * T$ .

$D^\alpha T = D^\alpha T * \delta = T * (D^\alpha \delta) = \delta * T$ .

So, now, as an example, and also it is important the Dirac distribution plays a particular important state, has a special status with respect to convolution.

So, theorem  $T \in D'(\mathbb{R}^N)$ ,  $\delta =$  Dirac distribution concentrated at 0. Then

$$T = \delta * T = T * \delta$$

So, if you, it is liking acting like the identity element in this binary operation. Delta is like the binary.

If  $\alpha$  any multi-index then

$$D^\alpha T = (D^\alpha \delta) * T$$

Remember, delta has support singleton and the origin so do all its derivatives. And therefore, it is a distribution with compact support therefore, you can convolve it with any other distribution there is no problem. So, proof let  $\varphi \in D(\mathbb{R}^N)$  then

$$(\delta * \varphi)(x) = \delta(\tau_x \varphi^\vee) = (\tau_x \varphi^\vee)(0) = \varphi^\vee(-x) = \varphi(x)$$

$$\Rightarrow \delta * \varphi = \varphi$$

So, if you take

$$(T * \delta) * \varphi = T * (\delta * \varphi) = T * \varphi$$

and so, by the cancellation like and again cancel this and therefore, you get

$$T * \delta = T = T * \delta.$$

Now, if you take

$$D^\alpha T = D^\alpha T * \delta = T * (D^\alpha \delta) = D^\alpha \delta * T$$

So, this proves this theorem. So, if you have a remark.

(Refer Slide Time: 21:48)

Remark:  $T_1, \dots, T_n \in \mathcal{D}'(\mathbb{R}^n)$  by pairwise convolution in any order ( $\because$  we have comm. & asso.) we can define  $T_1 * \dots * T_n$  provided at least  $n-1$  of them have cpt. support.

Ex:  $T_1 = 1$ ,  $T_2 = \delta'$ ,  $T_3 = H$

$T_1(\varphi) = \int \varphi$ ,  $T_2(\varphi) = -\varphi'(0)$ ,  $T_3(\varphi) = \int H\varphi$

$\delta' * H = \delta * H' = \delta * \delta = \delta$   
 $1 * \delta' = 1' * \delta = 0 * \delta = 0$

$1 * (\delta' * H) = 1 * \delta = 1$ ,  $(1 * \delta') * H = 0 * H = 0$

If you have  $T_1$  to  $T_n \in \mathcal{D}'(\mathbb{R}^N)$  then by pairwise convolution in any order since we have commutativity and associativity, we can define  $T_1 * \dots * T_n$  provided this is really important, at least  $n$  minus 1 of them have compact support. So, this, without this compact support, you cannot have the associative law and therefore, you cannot in an unambiguous way define the convolution in all this. So, let us give an example.

So, let us take 3 distributions, So,

$$T_1 = 1, \quad T_1(\varphi) = \int \varphi$$

$$T_2 = \delta', \quad T_2(\varphi) = -\varphi'(0)$$

$$T_3 = H, \quad T_3(\varphi) = \int H\varphi$$

So, this is 3 distributions we have. So let us take

$$\delta' * H = \delta * H' = \delta * \delta = \delta,$$

Now,

$$1 * \delta' = 1' * \delta = 0 * \delta = 0$$

So, let us take

$$1 * (\delta' * H) = 1 * \delta = 1;$$

On the other hand you have

$$(1 * \delta') * H = 0 * H = 0;$$

so these 2 are not equal. So, you do not have the associative law. So, therefore, it is important and why is it so, this is not of compact, not compact support so support not compact, in fact, is entire real line. This is support compact, and this support not compact, it is the negative, positive real axis.

So, therefore, you have to have them with non-compact supports and therefore, you cannot do this, so much about the convolution of distributions. Now, we will look at some applications.
