Compactness theorems – Part 3

So we were proving the various compactness theorems, namely the Rellich - Kondrachov theorem, which said that in a bounded open set the Sobolev embeddings almost all of them are compact embeddings, except one, namely when $p < N$, $W^{1,p} \rightarrow L^{p^*}$ is not compact. Apart from that all the rest we have compact and we proved it, for the case p bigger than n it comes directly from the Ascoli Arzela theorem.

And the fact that functions are in $W^{1,p}$ are Holder continuous. For $p = N$, We proved it using $p < N$ and for $p < N$ we use the Frechet Kolmogorov theorem, which characterizes relatively compact sets in L^{p^*} analogous to the Ascoli Arzela theorem. So, now we, these theorems are very useful when studying partial differential equations, especially nonlinear problems and Eigenvalue problems. And now we will see an application of this theorem.

(Refer Slide Time: 1:19)

Theorem: $\Omega \subset \mathbb{R}^N$ a bounded and connected open set of class C^1 . Let $P_m(\Omega)$ denote the vector space of all polynomials in the variables x_1, \dots, x_N over Ω and of degree less than or equal to m . Let $1 \leq p < \infty$. Let $u \in W^{m,p}(\Omega)$ and let \bar{u} be the equiv. class of u in the quotient space $W^{m,p}(\Omega)/P_m(\Omega)$, equipped with the norm

$$\|\bar{u}\|_{m,p,\Omega} = \inf_{p \in P_m(\Omega)} \|u+p\|_{m,p,\Omega}.$$

This norm is equivalent to the norm defined by

$$\bar{u} \mapsto \|u\|_{m,p,\Omega}.$$

P.

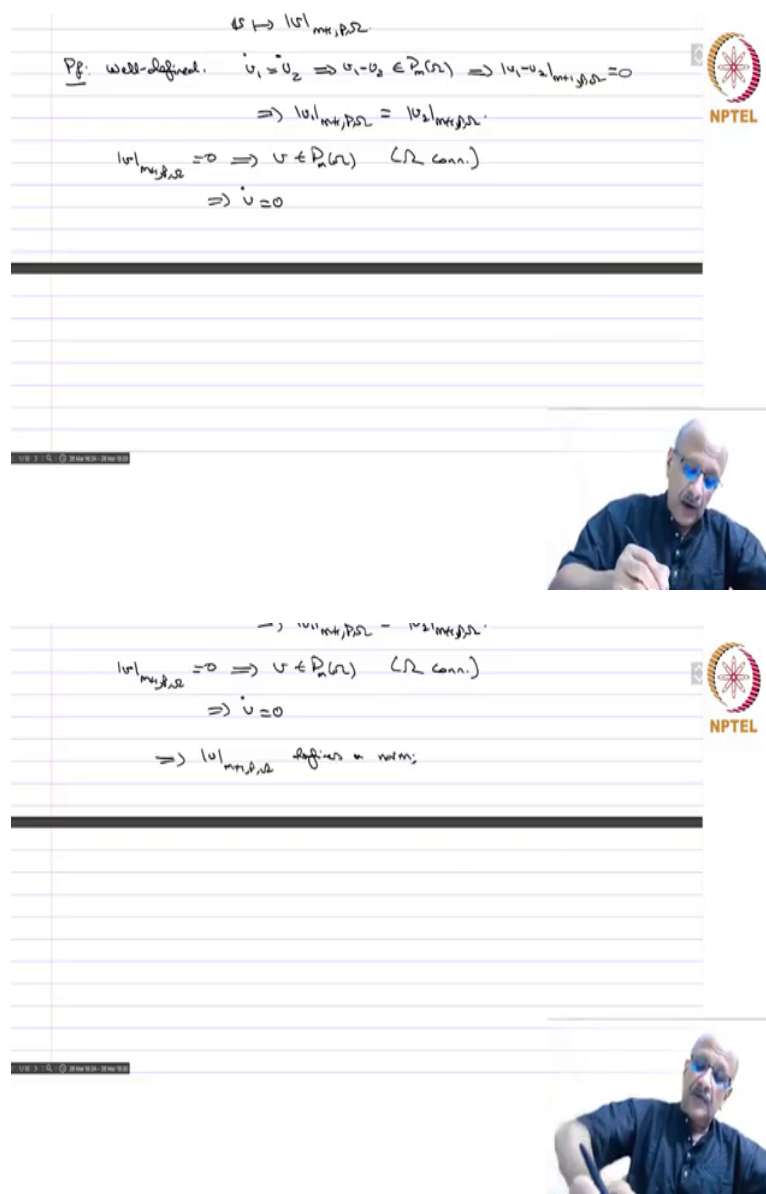

Theorem: $\Omega \subset \mathbb{R}^N$ -a bounded and connected open set of class C^1 . Let $P_m(\Omega)$ denote the vector space of all polynomials in the variables x_1, x_2, \dots, x_N over Ω and of degree less than or

equal to m . Let $1 \leq p < \infty$, let $W^{m+1,p}(\Omega)$ and let \dot{v} be the equivalence class of v , in the quotient space $W^{m+1,p}(\Omega)/P_m(\Omega)$, equipped with the norm

$$\|\dot{v}\|_{m+1,p,\Omega} = \inf_{P \in P_m(\Omega)} \|v + \tilde{P}\|_{m+1,p,\Omega}.$$

So, this is the classical norm. This norm, so the theorem is this, is equivalent to the norm defined by $\dot{v} \rightarrow |v|_{m+1,p,\Omega}$.

(Refer Slide Time: 4:53)

The slide displays a handwritten mathematical proof in blue ink on a lined background. The proof is divided into two sections by a horizontal line. The top section shows the derivation of the norm equivalence, starting with the definition of the equivalence class \dot{v} and the norm $\|\dot{v}\|_{m+1,p,\Omega}$. It then proves that the norm is well-defined by showing that if $\dot{v}_1 = \dot{v}_2$, then $\|v_1 - v_2\|_{m+1,p,\Omega} = 0$, which implies $v_1 - v_2 \in P_m(\Omega)$. The bottom section shows that the norm $|v|_{m+1,p,\Omega}$ is well-defined and satisfies the properties of a norm, including the triangle inequality and the property that $|v|_{m+1,p,\Omega} = 0$ if and only if $v \in P_m(\Omega)$. The NPTEL logo is visible in the top right corner of the slide. A video feed of a lecturer is shown in the bottom right corner of the slide.

Handwritten text on the slide:

$\dot{v} \mapsto |v|_{m+1,p,\Omega}$

Pf. well-defined. $\dot{v}_1 = \dot{v}_2 \Rightarrow v_1 - v_2 \in P_m(\Omega) \Rightarrow |v_1 - v_2|_{m+1,p,\Omega} = 0$

$\Rightarrow |v_1|_{m+1,p,\Omega} = |v_2|_{m+1,p,\Omega}$

$|v|_{m+1,p,\Omega} = 0 \Rightarrow v \in P_m(\Omega) \quad (\Omega \text{ conn.})$

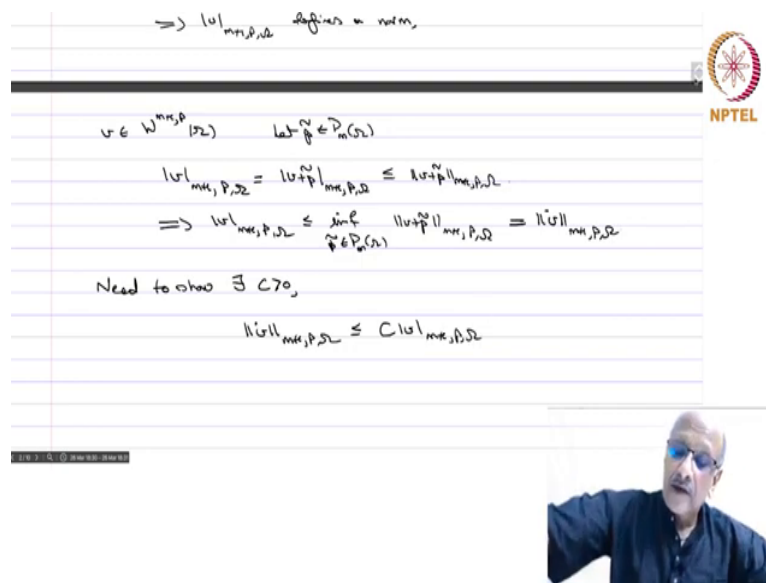

$\Rightarrow \dot{v} = 0$

$\Rightarrow |v|_{m+1,p,\Omega}$ satisfies a norm.

proof. First of all, we want to show that this is well defined. So, if $\dot{v}_1 = \dot{v}_2$, this implies that

$v_1 - v_2 \in P_m(\Omega) \Rightarrow |v_1 - v_2|_{m+1,p,\Omega} = 0 \Rightarrow |v_1|_{m+1,p,\Omega} = |v_2|_{m+1,p,\Omega}$ and therefore it is well defined. It does not depend on the representative which you are choosing in the quotient space. So, that is fine. So, the norm is well defined. And secondly if you have $|v|_{m+1,p,\Omega} = 0$, so this means that $v \in P_m(\Omega)$ because Ω is connected, so if the first derivative vanishes it is a constant, if the second derivative vanishes is the polynomial of degree 1, if the third derivative vanishes the polynomial degree 2 etcetera, if the $m+1$ th order derivative vanishes then it has to be a polynomial of degree m .

That means v dot is equal to the 0 element in the quotient space, so therefore, and the converse of course is true, and therefore you have that this defines a norm. So, this $|v|_{m+1,p,\Omega}$ is in fact a norm on the quotient space, so there is no problem about that. (Refer Slide Time: 6:52)

$\Rightarrow |v|_{m+1,p,\Omega}$ defines a norm,

$v \in W^{m,p}(\Omega) \quad \text{let } \tilde{v} \in P_m(\Omega)$

$|v|_{m+1,p,\Omega} = |v + \tilde{v}|_{m+1,p,\Omega} \leq \|v + \tilde{v}\|_{m+1,p,\Omega}$

$\Rightarrow |v|_{m+1,p,\Omega} \leq \inf_{\tilde{v} \in P_m(\Omega)} \|v + \tilde{v}\|_{m+1,p,\Omega} = \|v\|_{m+1,p,\Omega}$

Need to show $\exists C > 0$,

$\|v\|_{m+1,p,\Omega} \leq C |v|_{m+1,p,\Omega}$

Need to show $\exists C > 0$,

$$\|v\|_{m+1,p,\Omega} \leq C \|v\|_{m,p,\Omega} \quad \forall v \in W^{m+1,p}(\Omega) \quad (*)$$

Assume (*) fails $\forall C > 0$.

$$\forall n \exists \tilde{v}_n \in W^{m+1,p}(\Omega) \quad \|\tilde{v}_n\|_{m+1,p,\Omega} > n \|\tilde{v}_n\|_{m,p,\Omega}$$

Normalizing, $\exists v_n \in W^{m+1,p}(\Omega)$ s.t. $\|v_n\|_{m+1,p,\Omega} = 1$,

$$\|v_n\|_{m,p,\Omega} \rightarrow 0 \text{ as } n \rightarrow \infty.$$

WLOG, by a choice of suitable representative, we can assume

$$\|v_n\|_{m,p,\Omega} \leq 2.$$

So, now let us assume that $v \in W^{m+1,p}(\Omega)$, then you have $\tilde{P} \in P_m(\Omega)$, it is a polynomial of degree less than equal to m, then

$$\|v\|_{m+1,p,\Omega} = \|v + \tilde{P}\|_{m+1,p,\Omega} \leq \|v + \tilde{P}\|_{m+1,p,\Omega}$$

and this is true for all p. And therefore this implies that

$$\|v + \tilde{P}\|_{m+1,p,\Omega} \leq \inf_{\tilde{P} \in P_m(\Omega)} \|v + \tilde{P}\|_{m+1,p,\Omega} = \|v\|_{m+1,p,\Omega}$$

So, one-way inequality we already have. So we want to show that the reverse inequality, so to need to show there exists a constant C positive such that the reverse is true,

$$\|v\|_{m+1,p,\Omega} \leq C \|v\|_{m,p,\Omega}, \quad v \in W^{m+1,p}(\Omega) \quad \text{-----} (*)$$

So, we will do it by contradiction, so this is the standard method of doing it and see how compactness will come into play. So, assume the star fails. So, assume that this fails for every c positive. So, what does it mean? That means even if I take, however large C I take there will always be one for which the inequality will fail. So, I take C equals n for every n and therefore for every n there exists $\tilde{v}_n \in W^{m+1,p}(\Omega)$ such that

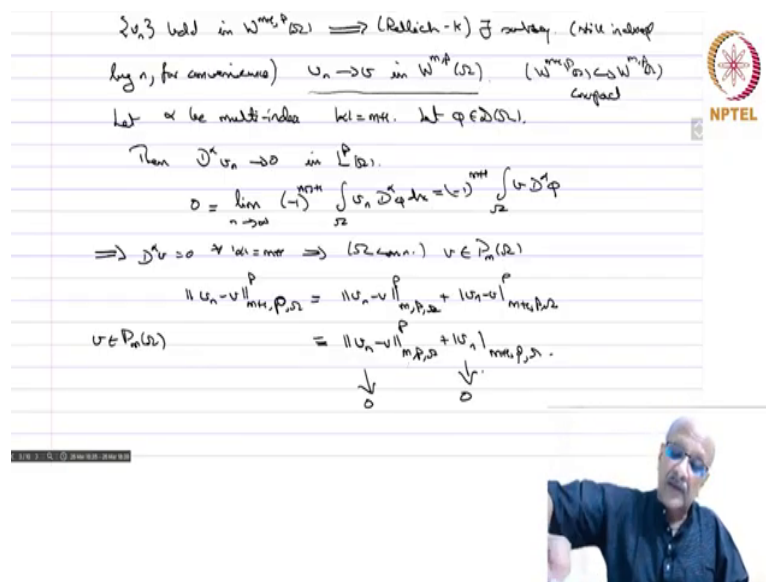

$$\|\tilde{v}_n\|_{m+1,p,\Omega} > n \|\tilde{v}_n\|_{m,p,\Omega}$$

So, we can normalize this, so normalizing there exists $v_n \in W^{m+1,p}(\Omega)$ such that

$$\|v_n\|_{m+1,p,\Omega} = 1 \text{ and } \|v_n\|_{m+1,p,\Omega} \rightarrow 0 \text{ as } n \rightarrow \infty.$$

So, now we have to, so we assume the inequality fails for every constant and we have got a sequence. Now, we have to get a contradiction. So, without loss of generality by choosing a suitable representative we can assume $\|v_n\|_{m+1,p,\Omega} \leq 2$. So, we can choose a p tilde suitably such that it is also the infimum is 1, so there must be 1 p tilde for which it will be less than 2, so if we add that to this nothing changes in all these inequalities, so we can assume that norm v_n is less than equal to 2. Just by the definition of the norm in the quotient space.

(Refer Slide Time: 11:35)

$\{v_n\}$ hold in $W^{m,p}(\Omega) \Rightarrow$ (Rellich-K) ∇ strong (Hilbert) inner product
 by n , for convenience $u_n \rightarrow u$ in $W^{m,p}(\Omega)$ ($W^{m,p}(\Omega) \hookrightarrow W^{m,p}(\Omega)$)
 let α be multi-index $|\alpha| = m+1$. let $q \in \partial\Omega$.
 Then $\nabla^\alpha u_n \rightarrow 0$ in $L^p(\Omega)$.
 $0 = \lim_{n \rightarrow \infty} (-1)^{|\alpha|} \int_{\Omega} u_n \nabla^\alpha q \, dx = (-1)^{|\alpha|} \int_{\Omega} u \nabla^\alpha q \, dx$
 $\Rightarrow \nabla^\alpha u = 0 \quad \forall |\alpha| = m+1 \Rightarrow (\Omega \hookrightarrow \mathbb{R}^n) \quad u \in \mathcal{P}_m(\Omega)$
 $\|u_n - u\|_{m,p,\Omega}^p = \|u_n - u\|_{m,p,\Omega}^p + \|u_n - u\|_{m,p,\Omega}^p$
 $\downarrow \quad \downarrow$
 $0 \quad 0$

Handwritten notes on lined paper showing mathematical derivations. The text includes:

$$v \in P_m(\Omega) = \|v_n - v\|_{m,p,\Omega}^p + \|v_n\|_{m,p,\Omega}^p$$

$$\Rightarrow v_n \rightarrow v \text{ in } W^{m,p}(\Omega)$$

$$\Rightarrow v_n \rightarrow v = 0 \quad (v \in P_m(\Omega) \text{ in } W^{m,p}(\Omega) / P_m(\Omega))$$

But $\|v_n\|_{m,p,\Omega} = 1$ (crossed out)

NPTEL logo is visible in the top right corner of the paper.

So, now v_n is bounded in $W^{m+1,p}(\Omega)$ and so by Rellich - Kondrachov or Rellich you have, so we will work with the subsequences, there exists a subsequence, still indexed by n for convenience because and I will work with that subsequence, so I do not want the original sequence anymore, so there is no need to write a n, k and all that, so we will just, such that a bounded sequence is as convergent subsequence, so $v_n \rightarrow v$ in $W^{m+1,p}(\Omega)$.

So, we proved the last corollary, which we proved is $W^{m+1,p}(\Omega) \rightarrow W^{m,p}(\Omega)$ is compact and we iterated it subsequently and then we have that this is compact. So, if you have a bounded sequence there will have to be a convergence of sequence in the image and therefore since it is just the inclusion map so we have $v_n \rightarrow v$ in $W^{m,p}(\Omega)$. So, let α be a multi index such that $|\alpha| = m + 1$. So, let $\phi \in D(\Omega)$, then $D^\alpha v_n \rightarrow 0$ in $L^p(\Omega)$, because that we know, because v_n in $m + 1, p$ Ω goes to 0 that means for all the $m + 1$ th order derivatives they have to go to 0 in $L^p(\Omega)$, so you have

$$0 = \lim_{n \rightarrow \infty} (-1)^{m+1} \int_{\Omega} v_n D^\alpha \phi \, dx = (-1)^{m+1} \int_{\Omega} v D^\alpha \phi \, dx .$$

So, this implies that $D^\alpha v = 0, \forall |\alpha| = m + 1$.

and that therefore Ω - connected again implies that $v \in P_m(\Omega)$. So,

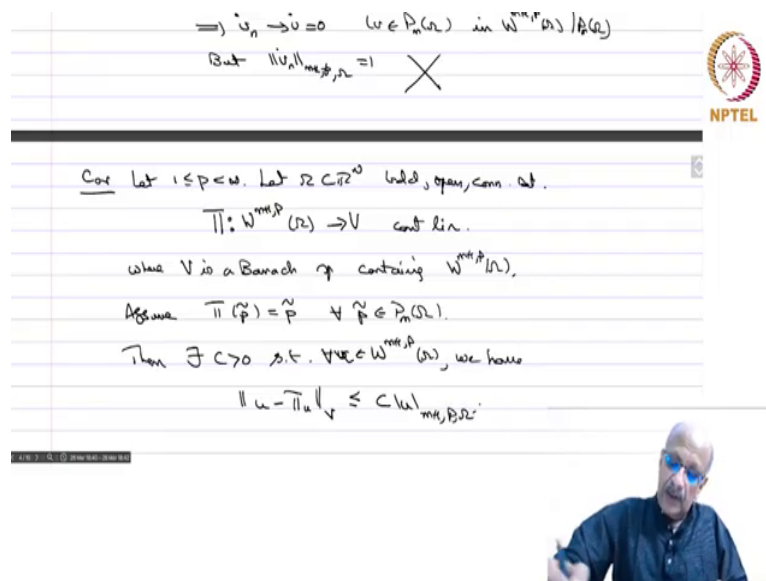

$$\begin{aligned} \|v_n - v\|_{m+1,p,\Omega}^p &= \|v_n - v\|_{m,p,\Omega}^p + \|v_n - v\|_{m+1,p,\Omega}^p \\ &= \|v_n - v\|_{m,p,\Omega}^p + \|v_n\|_{m+1,p,\Omega}^p \rightarrow 0 \end{aligned}$$

as $v \in P_m(\Omega)$, (so this v_n minus v m plus 1th order derivatives of v will all disappear).

Now, this goes to 0 since v_n converges to v in $W^{m,p}(\Omega)$, so you have that and therefore this goes to 0 and this goes to 0 by the assumption on the subsequence here and therefore both of these go to 0 and therefore this means that $v_n \rightarrow v$ in $W^{m+1,p}(\Omega)$ and then

$\dot{v}_n \rightarrow \dot{v}$, but $\dot{v} = 0$ since $v \in P_m(\Omega)$ but in $W^{m+1,p}(\Omega)/P_m(\Omega)$. But $\|v_n\|_{m+1,p,\Omega} = 1$, that was our definition, assumption. So, and therefore we have a contradiction and this completes the proof.

(Refer Slide Time: 17:11)

$\Rightarrow \dot{v}_n \rightarrow \dot{v} = 0$ ($v \in P_m(\Omega)$ in $W^{m+1,p}(\Omega)/P_m(\Omega)$)
 But $\|v_n\|_{m+1,p,\Omega} = 1$ ~~X~~
 Cor: Let $1 \leq p < \infty$. Let $\Omega \subset \mathbb{R}^N$ be bounded, open, conn. set.
 $\Pi: W^{m+1,p}(\Omega) \rightarrow V$ cont. lin.
 where V is a Banach space containing $W^{m+1,p}(\Omega)$.
 Assume $\Pi(\tilde{P}) = \tilde{P}$ $\forall \tilde{P} \in P_m(\Omega)$.
 Then $\exists C > 0$ s.t. $\forall u \in W^{m+1,p}(\Omega)$, we have
 $\|u - \Pi u\|_V \leq C \|u\|_{m+1,p,\Omega}$

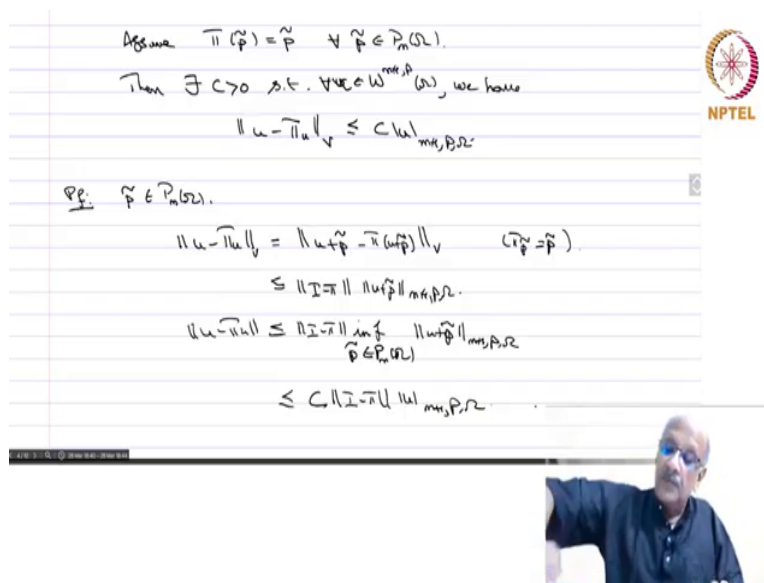

corollary: so let $1 \leq p < \infty$, let $\Omega \subset \mathbb{R}^N$ —bounded open connected set and

$\Pi: W^{m+1,p}(\Omega) \rightarrow V$, continuous linear where V is a Banach space containing $W^{m+1,p}(\Omega)$.

Assume $\Pi(\tilde{P}) = \tilde{P}$, for every $\tilde{P} \in P_m(\Omega)$. So, it preserves all the polynomials. Then there exists a $C > 0$ such that for every $u \in W^{m+1,p}(\Omega)$, we have

$$\|u - \Pi u\|_V \leq C \|u\|_{m+1,p,\Omega}.$$

(Refer Slide Time: 19:12)

Assume $\Pi(\tilde{p}) = \tilde{p} \quad \forall \tilde{p} \in P_m(\Omega)$.

Then $\exists C > 0$ s.t. $\forall u \in W^{m,p}(\Omega)$, we have

$$\|u - \Pi u\|_V \leq C |u|_{m,p,\Omega}$$

Proof: $\tilde{p} \in P_m(\Omega)$.

$$\begin{aligned} \|u - \Pi u\|_V &= \|u + \tilde{p} - \Pi(u + \tilde{p})\|_V \quad (\Pi \tilde{p} = \tilde{p}) \\ &\leq \|I - \Pi\| \|u + \tilde{p}\|_{m,p,\Omega} \\ \|u - \Pi u\| &\leq \|I - \Pi\| \inf_{\tilde{p} \in P_m(\Omega)} \|u + \tilde{p}\|_{m,p,\Omega} \\ &\leq C \|I - \Pi\| |u|_{m,p,\Omega} \end{aligned}$$

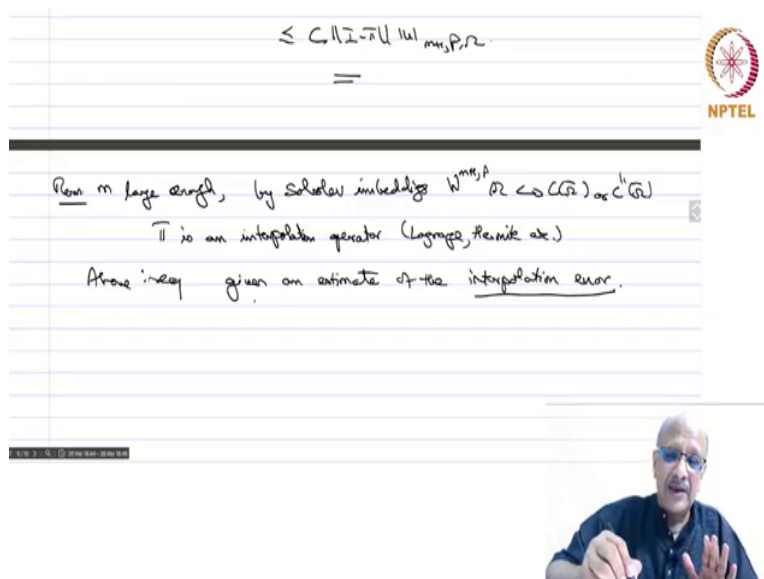

Proof: So, let $\tilde{p} \in P_m(\Omega)$, so

$$\|u - \Pi u\|_V = \|u + \tilde{p} - \Pi(u + \tilde{p})\|_V \leq \|I - \Pi\| \|u + \tilde{p}\|_{m+1,p,\Omega}.$$

$$\Rightarrow \|u - \Pi u\|_V \leq \|I - \Pi\| \inf_{\tilde{p} \in P_m(\Omega)} \|u + \tilde{p}\|_{m+1,p,\Omega} \leq C \|I - \Pi\| |u|_{m+1,p,\Omega}.$$

So, that tells you, that completes the proof.

(Refer Slide Time: 20:41)

$$\leq C \|I - \Pi\| |u|_{m,p,\Omega}$$

Now m large enough, by Sobolev imbedding $W^{m,p}(\Omega) \hookrightarrow C(\bar{\Omega}) \subset C^1(\bar{\Omega})$

Π is an interpolation operator (Lagrange, Remez etc.)

Above inequality gives an estimate of the interpolation error.

Now, how is this theorem useful?

remark: if m large enough, then by Sobolev embeddings, we have

$W^{m+1,p}(\Omega) \rightarrow C(\bar{\Omega})$ or $C^k(\bar{\Omega})$ it depends for some k . So, we can assume Π is an interpolation operator Lagrange, Hermite, etcetera, so that, so there will be, so these interpolation operators means that for some degree they will reproduce polynomials as it is and any other function they will give you another function here.

So, the above estimate, gives an estimate; above inequality gives an estimate of the interpolation error that means u by Πu is the interpolated polynomial operator and then you get the u minus Πu is the interpolation error, so this is very useful in numerical analysis, especially in the error estimate error analysis of methods like the finite element method.

(Refer Slide Time: 22:45)

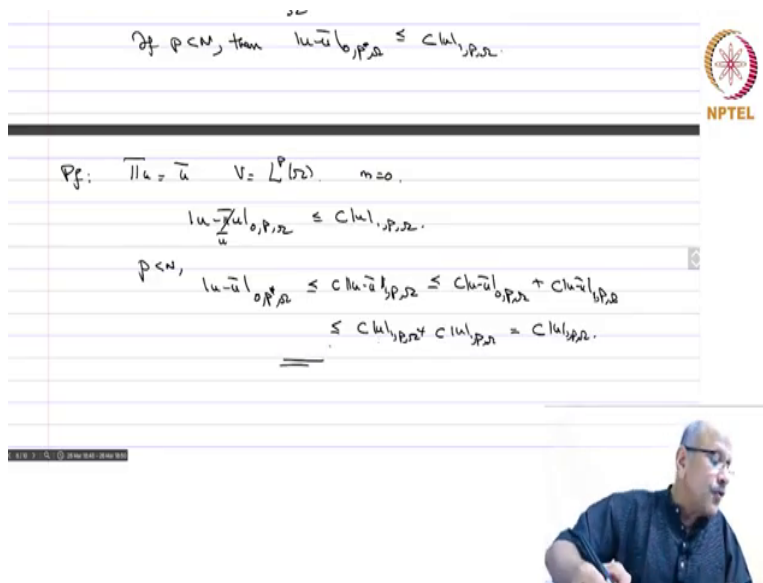

Theorem (Poincaré - Wirtinger Ineq.)
 $1 \leq p < \infty$. $\Omega \subset \mathbb{R}^N$ bounded, conn. set of class C^1 . Then \exists a
const. $C > 0$ s.t. $\forall u \in W^{1,p}(\Omega)$,
 $|u - \bar{u}|_{0,p,\Omega} \leq C|u|_{1,p,\Omega}$
where $\bar{u} = \frac{1}{|\Omega|} \int_{\Omega} u \, dx$.
If $p < N$, then $|u - \bar{u}|_{0,p^*,\Omega} \leq C|u|_{1,p,\Omega}$.

Now, we have another consequence of this theorem which is a very important inequalities extension of the Poincare inequality.

Theorem: (Poincare-Wirtinger inequality). So, $1 \leq p < \infty$, let $\Omega \subset \mathbb{R}^N$ —bounded open connected set of class C^1 . Then there exists a constant $C > 0$ such that for every $u \in W^{1,p}(\Omega)$, we have $|u - \bar{u}|_{0,p,\Omega} \leq C|u|_{1,p,\Omega}$, where $\bar{u} = \frac{1}{|\Omega|} \int_{\Omega} u(y) dy$.

If $p < N$, then $|u - \bar{u}|_{0,p^*,\Omega} \leq C|u|_{1,p,\Omega}$.

(Refer Slide Time: 24:32)

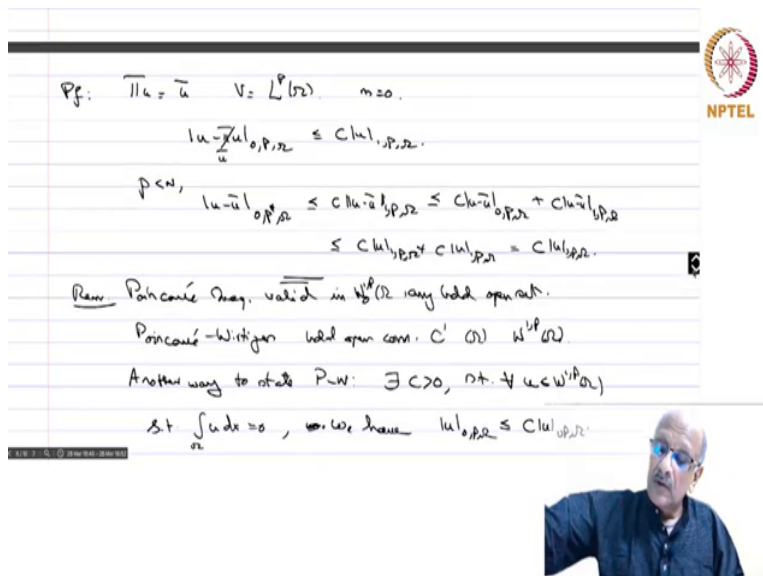

Proof: So, we are going to take $\Pi u = \bar{u}$, so this is like an interpolation operator. So, we have $V = L^p(\Omega)$, it contains $W^{m+1,p}(\Omega)$ and m equal to 0. We have m equal to 0 and so we have

$$|u - \Pi u|_{0,p,\Omega} \leq C|u|_{1,p,\Omega}.$$

If $p < N$, then you have that

$$\begin{aligned} |u - \bar{u}|_{0,p^*,\Omega} &\leq C|u - \bar{u}|_{1,p,\Omega} \leq C|u - \bar{u}|_{0,p,\Omega} + C|u - \bar{u}|_{1,p,\Omega} \\ &\leq C|u|_{1,p,\Omega} + C|u|_{1,p,\Omega} = C|u|_{1,p,\Omega}. \end{aligned}$$

(Refer Slide Time: 26:49)

remark: Poincare inequality is valid in $W^{1,p}_0(\Omega)$ for any bounded open set Ω . Poincare-Wirtinger is bounded, open, connected $C^1(\Omega)$ and, but it is valid in $W^{1,p}(\Omega)$. So, there is a price we have to pay with this. So, another way to state Poincare-Wirtinger is that there exists a constant C positive, such that for all $u \in W^{1,p}(\Omega)$, such that $\int_{\Omega} u dx = 0$, we have $|u|_{0,p,\Omega} \leq C|u|_{1,p,\Omega}$. So, this is the analog of the Poincare inequality, L^p norm bounded by H^1 , but on a condition namely that the average is 0. So, then we have this.
