$H_2 \subset H_1 \subset H_3$

Sol. Assume not. $\exists \varepsilon > 0$ s.t. $\forall n \exists u_n \in H_1$,
 $\|u_n\|_{H_2} > \varepsilon \|u_n\|_{H_1} + c \|u_n\|_{H_3}$

Normalize. $\|u_n\|_{H_2} = 1$.
 $1 > \varepsilon \|u_n\|_{H_1} + c \|u_n\|_{H_3}$

$\Rightarrow \|u_n\|_{H_1} \leq \frac{1}{\varepsilon} \quad \|u_n\|_{H_3} \rightarrow 0$
 $\Rightarrow \exists$ subseq. (again denoted u_n) $u_n \rightarrow$

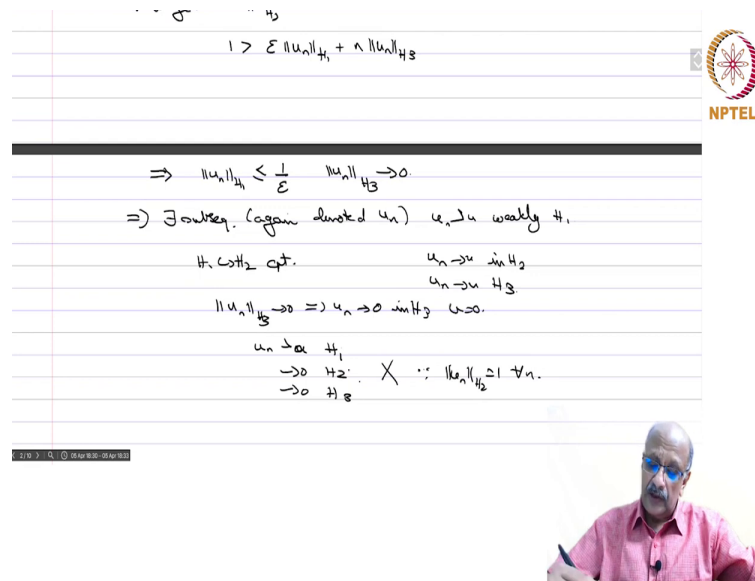

So, now we will do some more exercises. One, so let H_i , i equals 1, 2, 3 be Hilbert spaces such that we have the continuous inclusions H_1, H_2, H_3 . Assume that the inclusion H_1 in H_2 is compact. a, show that for every epsilon positive, let us, this itself is a. There exists c epsilon greater than 0 such that for every u in H_1 , we have norm u in H_2 is less than equal to epsilon times norm u in H_2 1 plus c epsilon times norm u in H_3 .

So, if $u \in H_1$ then it is in on in all the three spaces H_1, H_2, H_3 . What we are saying is we can estimate norm of u in the middle space H_2 by epsilon times norm u in H_1 . So, we are putting a very small coefficient for H_1 but then we pay a price, c epsilon will be somewhat large for H_3 . So, this is the idea.

So, solution. Assume not, then there exists an epsilon positive such that for every n you have there exists a u_n in H_1 which violates this with the constant n. So, however bigger the constant n you put for epsilon it will still violate. So, norm u_n of H_2 is bigger than epsilon times norm u_n in H_1 plus n times norm u_n in H_2 .

So, we can normalize and so you can assume that norm u_n in H_2 equal to 1, and then therefore you have 1 is bigger than, so you divide throughout by norm u_n in H_2 . So, that will give you a new vector u_n . So, that is u_n by norm u_n in H_2 , u_n in H_2 by norm u_n in H_2 , that will have norm 1 in H_2 . So, 1 is bigger than epsilon times norm u_n in H_1 plus n times norm u_n in H_3 .

(Refer Slide Time: 04:08)

Handwritten notes on a slide:

$$1 > \epsilon \|u_n\|_{H_1} + n \|u_n\|_{H_3}$$

$$\Rightarrow \|u_n\|_{H_1} \leq \frac{1}{\epsilon} \|u_n\|_{H_3} \rightarrow 0$$

\Rightarrow Bounded seq. (again denoted u_n) $u_n \rightarrow u$ weakly H_1 .

$H_1 \hookrightarrow H_2$ cpt. $u_n \rightarrow u$ in H_2
 $u_n \rightarrow u$ in H_3

$\|u_n\|_{H_3} \rightarrow 0 \Rightarrow u_n \rightarrow 0$ in H_3 $u=0$.

$u_n \rightarrow 0$ in H_1
 $\rightarrow 0$ in H_2
 $\rightarrow 0$ in H_3

$\times \because \|u_n\|_{H_2} \geq 1 \forall n$

NPTEL logo and a video feed of a lecturer in a pink shirt.

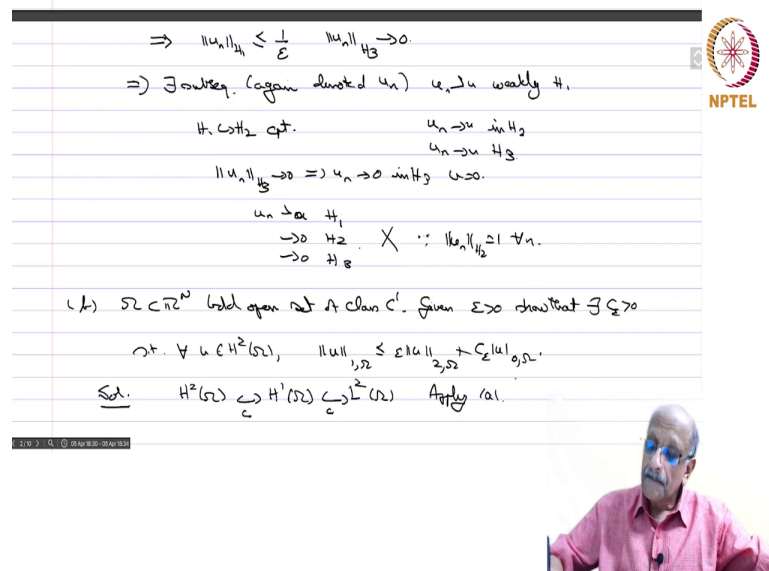

So, this will imply that norm u_n in H_1 is less than 1 by epsilon. So, it is bounded, and if you want, and then norm u_n in H_3 it goes to 0 because it is less than 1 by n and therefore it goes to 0.

So, you have, we are in the Hilbert space, we are in a bounded sequence in the Hilbert space, so there exists a subsequence again, denoted u_n , I have done this

often, so I am going to work with that subsequence, so I do not want to put the u and k , and so on because I am not interested in the original sequence anymore. So, again I define it as u_n such that u_n converges to u weakly in H_1 .

But then H_1 to H_2 is compact, so H_1 to H_2 compact, so weak convergence becomes strong, so u_n goes to u in H_2 and therefore obviously u_n will go to u in H_3 . But norm u_n goes to 0 in H_3 , and this implies, norm u_n in H_3 goes to 0, so implies u_n goes to 0 in H_3 and therefore u equal to 0. So, u_n goes to, weakly to u in H_1 , weakly to 0 in H_1 , in norm in H_2 and also in norm in H_3 . But this is a contradiction since norm u_n is 1 for all n . So, it cannot go to 0 in norm. So, this is a contradiction, and therefore we have that the inequality is valid.

(Refer Slide Time: 06:13)

Handwritten notes on a slide:

- $\Rightarrow \|u_n\|_{H_1} \leq \frac{1}{\varepsilon} \|u_n\|_{H_3} \rightarrow 0.$
- $\Rightarrow \exists$ subseq. (again denoted u_n) $u_n \rightharpoonup u$ weakly H_1 .
- $H_1 \hookrightarrow H_2$ cpt. $u_n \rightarrow u$ in H_2
- $u_n \rightarrow u$ in H_3
- $\|u_n\|_{H_3} \rightarrow 0 \Rightarrow u_n \rightarrow 0$ in H_3 $\hookrightarrow u = 0.$
- $u_n \rightharpoonup u$ in H_1
- $\rightarrow 0$ in H_2 $\times \because \|u_n\|_{H_2} = 1 \forall n.$
- $\rightarrow 0$ in H_3
- (b) $\Omega \subset \mathbb{R}^N$ bounded open set of class C^1 . Given $\varepsilon > 0$ show that $\exists \delta > 0$
- s.t. $\forall u \in H^2_0(\Omega), \|u\|_{1,\Omega} \leq \varepsilon \|u\|_{2,\Omega} + \delta \|u\|_{0,\Omega}.$
- Sol. $H^2_0(\Omega) \hookrightarrow H^1_0(\Omega) \hookrightarrow L^2(\Omega)$ Apply (a).

NPTEL logo and video feed of a professor in a pink shirt.

So, (b), $\Omega \subset \mathbb{R}^N$ bounded open set of class C^1 given epsilon positive. Show that there exists a δ epsilon which is positive such that for every u in $H^2_0(\Omega)$, we have norm u in $L^2(\Omega)$ is less than epsilon times norm u in $H^2_0(\Omega)$ plus δ epsilon times norm u in $L^2(\Omega)$.

Solution is one line. So, you have $H_2(\Omega)$ is continuously included in $H_1(\Omega)$ and that is completely in $L^2(\Omega)$. And then we have seen by Rayleigh (07:21) in fact both these inclusions are compact. This one is compact by Rayleigh's theorem, and this and this by iteration we said that every H^m will be in H^m compact, so apply a.

(Refer Slide Time: 07:40)

$$\text{ex. } A \in C^2(\Omega), \quad \|u\|_{1,\Omega} \leq \varepsilon \|u\|_{2,\Omega} + C_\varepsilon \|u\|_{0,\Omega}.$$

Sol. $H^2(\Omega) \subset_c H^1(\Omega) \subset_c L^2(\Omega)$ Apply (a).

(c) Prove same res. in \mathbb{R}^2 and show that $C_\varepsilon = C\varepsilon^{-1}$.

$$u \in H^2(\mathbb{R}^N).$$

$$\int_{\mathbb{R}^n} (1+|x|^2)^{-1} |\hat{u}(x)|^2 dx = \int_{|x|<1} + \int_{|x|\geq 1}$$

$$= \int_{|x|<1} (1+|x|^2)^{-1} |\hat{u}(x)|^2 dx + \int_{|x|\geq 1} \frac{(1+|x|^2)^{-1} |\hat{u}(x)|^2}{|x|^2} dx$$

$$= \int_{|z| < 1} (4|z|^2) |\hat{u}(z)|^2 dz + \int_{|z| \geq 1} \frac{(4|z|^2)^2 |\hat{u}(z)|^2}{4|z|^2} dz.$$

$$\leq (1+\eta^2) \int_{\mathbb{R}^N} |\hat{u}(z)|^2 dz + \frac{1}{4\eta^2} \int_{\mathbb{R}^N} (1+|z|^2)^2 |\hat{u}(z)|^2 dz.$$

$$\|u_n\|_{1, \mathbb{R}^N}^2 \leq (1 + \eta^2) \|u\|_{0, \mathbb{R}^N}^2 + \frac{1}{1 + \eta^2} \|u_k\|_{2, \mathbb{R}^N}^2.$$

$$\alpha^2 \beta^2 \leq (\alpha \beta)^2 \quad \|u\|_{1/2} \leq \sqrt{\frac{1}{2}} \|u\|_1 + \frac{1}{\sqrt{2}} \|u\|_2$$

Then c, prove same inequality in \mathbb{R}^N , so now no longer you can use the previous theorem because you do not have compact inclusions, and that, and show that c epsilon can be taken as c times epsilon power minus 1.

So, let u belong to $H^2(\mathbb{R}^N)$. And then we want to look at the H^1 norm. So, integral on \mathbb{R}^N 1 plus mod ξ square, we are going to use the Fourier interpretation, mod u

that $\int_{\mathbb{R}^N} |\xi|^2 d\xi = \int_{|\xi| \leq \eta} |\xi|^2 d\xi + \int_{|\xi| > \eta} |\xi|^2 d\xi$.

So that is, $\int_{\mathbb{R}^N} |\xi|^2 d\xi \leq \int_{|\xi| \leq \eta} |\xi|^2 d\xi + \int_{|\xi| > \eta} |\xi|^2 d\xi$. The first term is bounded by $\eta^2 \int_{|\xi| \leq \eta} d\xi \leq \eta^2 C \eta^N$. The second term is bounded by $\int_{|\xi| > \eta} |\xi|^2 d\xi \leq \int_{|\xi| > \eta} |\xi|^2 d\xi$. So we have got the L^2 norm here.

Plus, again $|\xi|$ is bigger than η and therefore it is in the denominator $1 + |\xi|^2$. So, here also let me just write η^2 . $\int_{\mathbb{R}^N} |\xi|^2 d\xi \leq \int_{|\xi| \leq \eta} |\xi|^2 d\xi + \int_{|\xi| > \eta} |\xi|^2 d\xi$. Now I am going to write integral on \mathbb{R}^N because I am going to, $|\xi| > \eta$ is what I have to write, I am going to write the bigger integral $1 + |\xi|^2$, whole square $\int_{\mathbb{R}^N} |\xi|^2 d\xi$.

So, you get that $\|u\|_{L^2(\mathbb{R}^N)}^2 \leq \int_{\mathbb{R}^N} |\xi|^2 d\xi \leq \int_{|\xi| \leq \eta} |\xi|^2 d\xi + \int_{|\xi| > \eta} |\xi|^2 d\xi$. So, $a^2 + b^2 \leq (a+b)^2$ and therefore you have $\|u\|_{L^2(\mathbb{R}^N)} \leq \sqrt{1 + \eta^2} \|u\|_{L^2(\mathbb{R}^N)}$. And then you take $1 + \eta^2 = \epsilon$. And then you are done.

(Refer Slide Time: 11:45)

② $\Omega \subset \mathbb{R}^N$ open set $E \subset \Omega$ arbitrary subset

Capacity of E w.r.t. Ω :

$$\text{Cap}_\Omega(E) \stackrel{\text{def}}{=} \inf \left\{ \int_\Omega |\nabla u|^2 dx \mid u \in H_0^1(\Omega), u \equiv 1 \text{ in a nbhd of } E \right\}.$$

(a) $E \subset F \subset \Omega \Rightarrow \text{Cap}_\Omega(E) \leq \text{Cap}_\Omega(F)$.

$u \in H_0^1(\Omega)$ $u \equiv 1$ nbhd of $F \Rightarrow u \equiv 1$ nbhd of E .

$\Rightarrow \text{Cap}_\Omega(E) \leq \text{Cap}_\Omega(F)$.

(b) $\text{Cap}_\Omega(E) = \inf \{ \text{Cap}_\Omega(\Omega') \mid E \subset \Omega' \subset \Omega, \Omega' \text{ open} \}$.

$\text{Cap}_\Omega(E) \leq \text{Cap}_\Omega(\Omega') \quad \forall E \subset \Omega' \subset \Omega$.

$\text{Cap}_\Omega(E) \leq \inf_{E \subset \Omega' \subset \Omega} \{ \text{Cap}_\Omega(\Omega') \}$

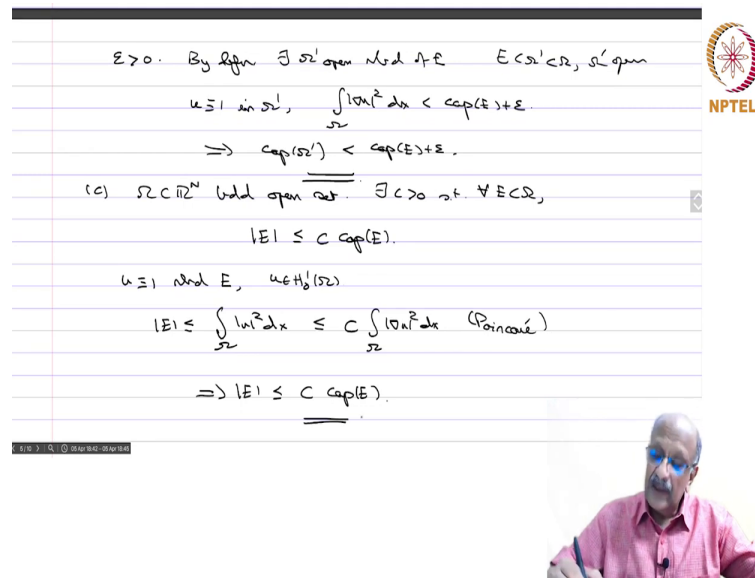

Second one. So, Ω contained in \mathbb{R}^N open set and E contained in Ω arbitrary subset. So, we define capacity of E with respect to Ω . So, we write this as cap of E , so you should put an Ω here, $\text{cap } \Omega$ of E but we may, I may drop it when I am talking only of, so this is the definition. \inf of integral over Ω mod $|\nabla u|^2 dx$, where u is in H_0^1 of Ω and u identically 1 in a neighborhood of E .

So, this is called the capacity, sometimes called the electrostatic capacity because this comes from the electrostatic, theory of electrostatics and you in fact these functions will come there so there is a condenser in the center, the E will represent a certain condenser and then around it you have an electrical field, and this is the kind of functions which we will study there.

So, a, if E is contained in F is contained in Ω , this implies cap , so I will drop the Ω now, so $\text{cap } E$ is less than equal to $\text{cap } F$. So, this obvious, if u is in H_0^1 of Ω , u identically 1 neighborhood of F implies u is identically 1 in a neighborhood of E . And therefore, you are taking the infimum of a bigger set for E , so the infimum will be smaller and therefore this implies that $\text{cap } E$ is less than equal to $\text{cap } F$. This from the notion of an infimum.

Now, $\text{cap } E$ equals \inf of $\text{cap } \omega$ prime such that E is contained in ω prime contained in ω , ω prime open. So, obviously $\text{cap } E$ is, is less than equal to $\text{cap } \omega$ prime for all E contained in ω prime contained in ω , and therefore $\text{cap } E$ is less than or equal to infimum of $\text{cap } \omega$ prime, ω prime contained in ω , E contained in ω prime So one, one inequality is clear. So, we have to show the reverse inequality.

(Refer Slide Time: 14:50)

$\varepsilon > 0$. By defn $\exists \Omega'$ open s.t. $E \subset \Omega' \subset \Omega$, Ω' open
 $u \equiv 1$ in Ω' , $\int_{\Omega'} |\nabla u|^2 dx < \text{cap}(E) + \varepsilon$.
 $\Rightarrow \text{cap}(\Omega') < \text{cap}(E) + \varepsilon$.
 (c) $\Omega \subset \mathbb{R}^N$ bounded open set. $\exists c > 0$ s.t. $\forall E \subset \Omega$,
 $|E| \leq c \text{cap}(E)$.
 $u \equiv 1$ in Ω' , $u \in H_0^1(\Omega)$
 $|E| \leq \int_{\Omega'} |\nabla u|^2 dx \leq c \int_{\Omega'} |\nabla u|^2 dx$ (Poincaré)
 $\Rightarrow |E| \leq c \text{cap}(E)$.

So, let epsilon be greater than 0. So, by definition there exists omega prime open neighborhood of E, so E is contained in omega prime contained in omega, omega prime open, such that integral u is identically 1 in omega prime and integral of omega mod grad u square d x is less than cap E plus epsilon because that is the definition of the infimum. So, the E, cap E is infimum. So, we can find one which you can do like this.

So, now because u is 1 in omega prime, that is the neighborhood of omega prime, its omega prime is an open set and therefore this implies that cap of omega prime which is the infimum of such functions is less than cap E plus epsilon. And that proves the result. So, we have that in fact the infimum is equal to the whole thing.

c, omega in \mathbb{R}^N , bounded open set, there exists a c greater than 0, such that for all E contained in omega, you have measure of E this is the Lebesgue measure of E is less than equal to c times capacity of E. So, this capacity is something like the measure. It is comparable to the measure. So, it is another kind of measure of a set. How big a set is can be found in a different way.

So, we have u identically 1 in the neighborhood of E, u in $H_0^1(\Omega)$. Let us take any such function. So, then you have mod E is less than equal to integral on omega mod

$u^2 dx$ because $\int u^2 dx$ over Ω is greater than or equal to $\int u^2 dx$ over E and then it is identical in a neighborhood so it is C^1 , and so that is equal to $\int u^2 dx$ over E . So, this is trivial.

And now by the Poincaré inequality this is less than equal $c \int |\nabla u|^2 dx$ and this is nothing but Poincaré inequality. So, this is true for any such u . So, you take the infimum so $\int u^2 dx$ is less than equal to c times capacity of u . So, that these are some elementary facts about the capacity.

(Refer Slide Time: 17:45)

③ Let $\Omega \subset \mathbb{R}^N$ be a bounded open convex set and let $0 \in \Omega$.
 Let $0 < \lambda < 1$, $\lambda\Omega = \{\lambda x \mid x \in \Omega\} \subset \Omega$.
 Let $1 \leq p < N$. Let $u \in W^{1,p}_0(\Omega)$, $|u|_{0,p,\Omega} = 1$.
 Define $u_k(x) = \begin{cases} \int_{\lambda\Omega \cap B_k(x)} u(x) dx & x \in \lambda\Omega \\ 0 & x \in \mathbb{R}^N \setminus \lambda\Omega \end{cases}$.
 Show that $u_k \in W^{1,p}_0(\Omega)$.
 $|u_k|_{p,\Omega} = |u|_{p,\Omega} \quad \forall k$.
 $|u_k|_{0,p,\Omega} = |u|_{0,p,\Omega} \quad \forall k$.
 Deduce that $W^{1,p}_0(\Omega) \hookrightarrow L^p(\Omega)$ is NOT compact.

(3), so let $\Omega \subset \mathbb{R}^N$ be a bounded open convex set, and let $0 \in \Omega$. Let $0 \leq \lambda \leq N$, then define $\lambda\Omega$ equals set of all λx , x is in Ω . So, 0 is in Ω and any x is in Ω , so λx for all 0 to λ , it is, will be in Ω itself, so this is contained in Ω . Let $1 \leq p \leq N$. Let u belong to $W^{1,p}_0(\Omega)$ $|u|_{0,p,\Omega} = 1$.

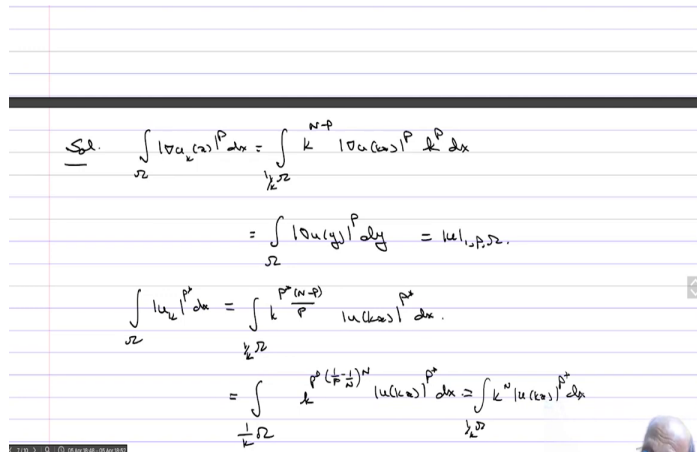

So, we choose such a function. You can always find, you can find any u which is non-zero divided by the L^p star norm because $W^{1,p}_0$ is contained in L^p star and that will have norm L^p star 1. So, define

$$u_k(x) = k^{\frac{N-p}{p}} u(kx) \quad \text{if } x \in \frac{1}{k}\Omega$$

$$= 0 \quad \text{if } x \in \Omega \setminus \frac{1}{k}\Omega$$

Then show that $u_k \in W^{1,p}_0(\Omega)$, $\|u_k\|_{W^{1,p}_0(\Omega)} = \|u\|_{W^{1,p}_0(\Omega)}$, for all k and $\text{mod } u_k \rightarrow 0$ in L^p star Ω equals $\text{mod } u \rightarrow 0$ in L^p star Ω for all k . Deduce that $W^{1,p}_0(\Omega)$ included in L^p star Ω is not compact. So, here we have an example, explicit example of a domain which is a convex open set containing the origin where $W^{1,p}_0(\Omega)$ and hence $W^{1,p}(\Omega)$ also in L^p star is not compact. We saw in the (20:56) theorem the L^p star was excluded.

(Refer Slide Time: 21:05)

Slide content:

$$\begin{aligned} \int_{\Omega} |\nabla u_k(x)|^p dx &= \int_{\frac{1}{k}\Omega} k^{N-p} |\nabla u(x)|^p k^p dx \\ &= \int_{\Omega} |\nabla u(y)|^p dy = \|u\|_{W^{1,p}_0(\Omega)}^p. \\ \int_{\Omega} |u_k|^p dx &= \int_{\frac{1}{k}\Omega} k^{\frac{p(N-p)}{p}} |u(x)|^p dx \\ &= \int_{\frac{1}{k}\Omega} k^{p(\frac{1}{p}-1)N} |u(x)|^p dx = \int_{\frac{1}{k}\Omega} |u(x)|^p dx. \end{aligned}$$

NPTEL logo is visible in the top right corner of the slide.

$$\begin{aligned}
 &= \int_{\Omega} |\nabla u(y)|^p dy = |u|_{1,p,\Omega}. \\
 \int_{\Omega} |u_k|^p dx &= \int_{\frac{1}{k}\Omega} k^{\frac{p(N-p)}{p}} |u(kx)|^p dx \\
 &= \int_{\frac{1}{k}\Omega} k^{\frac{p}{p}(\frac{N-p}{p})^N} |u(kx)|^p dx = \int_{\frac{1}{k}\Omega} |u(kx)|^p dx \\
 &= \int_{\Omega} |u(y)|^p dy = 1. \\
 \Rightarrow u_k &\in W^{1,p}(\Omega), \text{ it vanishes outside } \frac{1}{k}\Omega \Rightarrow u_k \in W_0^{1,p}(\Omega).
 \end{aligned}$$

Solution

$$\int_{\Omega} |\nabla u_k(x)|^p dx = \int_{\frac{1}{k}\Omega} k^{N-p} |\nabla u(kx)|^p k^p dx$$

$$= \int_{\Omega} |\nabla u(x)|^p dx = |u|_{1,p,\Omega}$$

$$\int_{\Omega} |u(x)|^p dx = \int_{\frac{1}{k}\Omega} k^{p^*(N-p)/p} |ku(x)|^{p^*} dx$$

$$= \int_{\frac{1}{k}\Omega} k^{p(1/p-1/N)N} |ku(x)|^{p^*} dx$$

$$= \int_{\frac{1}{k}\Omega} |u(kx)|^{p^*} dx$$

$$= \int_{\Omega} |u(x)|^{p^*} dx = |u|_{1,p,\Omega}.$$

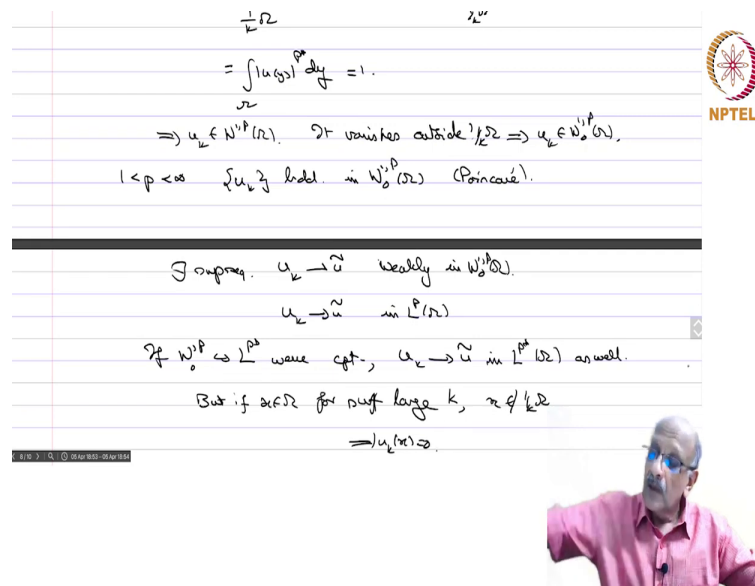

So now if you make a change of variable kx equal to y , then $k^N dx$ will be dy , and therefore this will be equal to, and this k^{N-P} and k^P would have got cancelled so this will become integral on $\Omega \bmod \text{grad } u$ $y^P dy$ which is equal to $\int_{\Omega \bmod \text{grad } u} y^P dy$.

Integral on $\Omega \bmod u$ $k^P dx$ will be equal to integral over Ω by k^N k^{N-P} dx . So, that is equal to integral 1 over Ω , I will take a k^N outside.

So, if I take k^N outside, I will get k^P into $\int_{\Omega} 1 dx$ which is exactly $\int_{\Omega} 1 dx$, sorry and what is in the bracket, this 1 by k^P will cancel with this k^P , so you will just get $\int_{\Omega} k^N dx$. So, this is not into k^N , it is just into N . I am just rewriting the expression like this. Now, 1 by k^P and 1 by k^P that is cancelled, so that just becomes integral over $\int_{\Omega} k^N dx$.

Now, you again make a change of variable, that is equal to integral $\int_{\Omega \bmod u} y^P dy$ and that is equal to $\int_{\Omega} 1 dx$. So, this proves, so this implies that u belongs to $W^{1,p}(\Omega)$ but it vanishes outside Ω and therefore this implies that u belongs to $W^{1,p}_0(\Omega)$ for all k this, so this 1 by k closure is again, so you can, we have seen this theorem. It vanishes outside a closed set so you can take the closure also, and therefore it is.

(Refer Slide Time: 25:02)

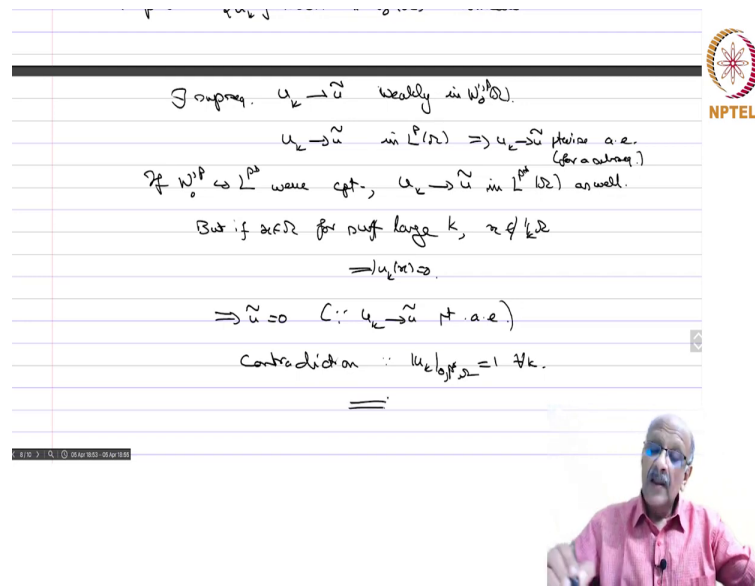

$\frac{1}{k} \Omega$ Ω
 $= \int_{\Omega} |u_k| dy = 1.$
 $\Rightarrow u_k \in W^{1,p}_0(\Omega).$ It vanishes outside $\frac{1}{k} \Omega \Rightarrow u_k \in W^{1,p}_0(\Omega).$
 $1 < p < \infty$ $\{u_k\}$ hold in $W^{1,p}_0(\Omega)$ (Poincaré).

 \exists subseq. $u_k \rightharpoonup \tilde{u}$ weakly in $W^{1,p}_0(\Omega).$
 $u_k \rightarrow \tilde{u}$ in $L^p(\Omega)$
 If $W^{1,p}_0 \hookrightarrow L^p$ were cpt., $u_k \rightarrow \tilde{u}$ in $L^p(\Omega)$ as well.
 But if $x \in \Omega$ for suff large k , $x \notin \frac{1}{k} \Omega$
 $\Rightarrow u_k(x) = 0.$

So, let $1 < p < \infty$, so u_k is bounded in $W^{1,p}_0(\Omega)$ because its mod 1, is bounded and therefore by Poincaré, so this is Poincaré, and therefore there exists a subsequence such that, so I will again call it u_k , u_k converges some \tilde{u} in, weakly, in $W^{1,p}_0(\Omega)$. Because it is a reflexive space if you have a bounded sequence in a reflexive space then you have the thing.

So, now if and by (26:03) this converges \tilde{u} in L^p of Ω . So, if $W^{1,p}_0(\Omega)$ to L^p star were compact, then u_k will go to \tilde{u} in L^p star Ω . But if x belongs to Ω for sufficiently large k , x is not in $\frac{1}{k} \Omega$ implies $u_k(x) = 0$.

(Refer Slide Time: 26:58)

\exists subseq. $u_k \rightharpoonup \tilde{u}$ weakly in $W_0^{1,p}(\Omega)$.
 $u_k \rightharpoonup \tilde{u}$ in $L^p(\Omega) \Rightarrow u_k \rightarrow \tilde{u}$ ptwise a.e. (for a subseq.)
 If $W_0^{1,p} \hookrightarrow L^p$ were cpt., $u_k \rightarrow \tilde{u}$ in $L^p(\Omega)$ as well.
 But if a.e. for nft large k , $u_k \neq 0$
 $\Rightarrow u_k(x) \rightarrow 0$
 $\Rightarrow \tilde{u} = 0$ (i.e. $u_k \rightarrow \tilde{u}$ pt. a.e.)
 Contradiction $\because \|u_k\|_{L^p(\Omega)} = 1 \forall k$.
 \Rightarrow

So after, after some level every point $u_k(x)$ becomes 0, so this implies that \tilde{u} equal to 0. Since u_k converges to \tilde{u} , pointwise almost everywhere, almost everywhere, again, for a subsequence. So, I am going, keeping on working with the, smaller and smaller subsequence and therefore you have this. But that is a contradiction since $\|u_k\|_{L^p(\Omega)} = 1$ for all k . So, it cannot go to 0 in the L^p norm. So, that proves this thing. We will continue with this.
