**The elasticity system**

(Refer Slide Time: 0:18)

THE ELASTICITY SYSTEM

Let  $\Omega \subset \mathbb{R}^3$  be a bounded open connected set.

$\Gamma = \partial\Omega = \Gamma_1 \cup \Gamma_2$ ,  $\Gamma_1 \cap \Gamma_2 = \emptyset$

(Surface measure of  $\Gamma_0$ )  $> 0$ .  $\nu$  = unit outward normal on  $\Gamma$ .

A body force  $f = (f_1, f_2, f_3)$  acts on  $\Omega$  and surface force

$g = (g_1, g_2, g_3)$  acts on  $\Gamma$ .

Let  $u = (u_1, u_2, u_3)$  be displacement vector.

Strain tensor:  $\epsilon_{ij}(u) = \frac{1}{2} \left( \frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right)$ ,  $1 \leq i, j \leq 3$ .

Stress tensor:  $(\sigma_{ij}(u))_{i,j=1}^3$ .

**Elasticity system:**

Now, our next example is the elasticity system. So, let  $\Omega \subset \mathbb{R}^3$ , so we are restricting ourselves to  $\mathbb{R}^3$ . We are bounded open and connected. This is the volume occupied by an elastic body. So, this is  $\Omega$ , it is a volume occupied by an elastic body. So,

$$\Gamma = \partial\Omega = \Gamma_1 \cup \Gamma_2, \quad \Gamma_1 \cap \Gamma_2 = \emptyset$$

so we have a portion here. So, this is a three dimensional body. So, this part we call as  $\Gamma_0$  and this part of the boundary is  $\Gamma_1$ .

Now, surface measure of  $\Gamma_0$  is strictly positive, that is assumed here, because we are going to impose a Dirichlet condition there. And then  $\nu$  equals unit outward normal on  $\Gamma$ . A body force

$f = (f_1, f_2, f_3)$ , acts on  $\Omega$  and a surface force  $g = (g_1, g_2, g_3)$ , acts on  $\Gamma_1$ . So, there is a force, which acts on  $\Gamma_1$  and then which could be something like a shear force, or something and then you have a force which x. So, we want to study the deformation of the bond.

So, let  $u = (u_1, u_2, u_3)$ , be the displacement vector. This is the one, which we are interested in.

So, when you act this body on with these forces, we want to see how the body deforms, that means we have to compute  $u$  at every point of  $\Omega$ , then we know. Now, we have the

**strain tensor**, we have seen this already in the context of Khan's inequality. So, we have

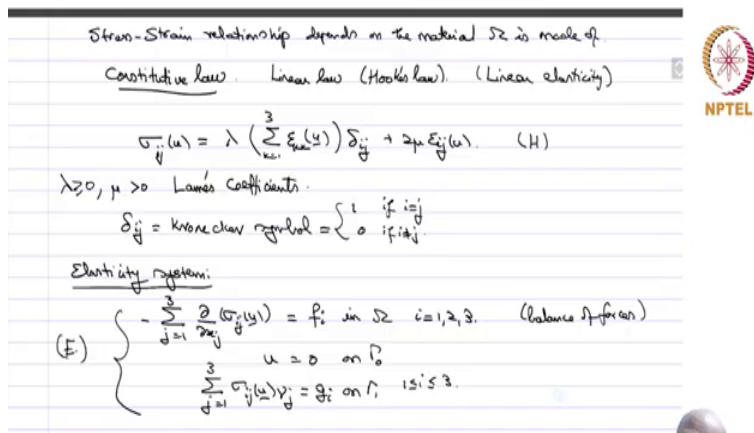

$$\varepsilon_{ij}(u) = \frac{1}{2} \left( \frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right)$$

, this is a symmetric tensor. So,  $1 \leq i, j \leq 3$ .

Now, the

**stress tensor** is  $\{\sigma_{ij}(u)\}_{i,j=1}^3$  and this is the one, which tells you how the body is going to deform under the action of the forces. So, the balance of forces will be written in terms of this.

(Refer Slide Time: 4:16)

Stress-Strain relationship depends on the material & is made of.

Constitutive law: Linear law (Hooke's law). (Linear elasticity)

$$\sigma_{ij}(u) = \lambda \left( \sum_{k=1}^3 \varepsilon_{kk}(u) \right) \delta_{ij} + 2\mu \varepsilon_{ij}(u). \quad (H)$$

$\lambda > 0, \mu > 0$  Lamé coefficients.

$\delta_{ij}$  = Kronecker symbol =  $\begin{cases} 1 & \text{if } i=j \\ 0 & \text{if } i \neq j \end{cases}$

Elasticity system:

$$(E) \quad \begin{cases} -\sum_{j=1}^3 \frac{\partial \sigma_{ij}(u)}{\partial x_j} = f_i & \text{in } \Omega, \quad i=1,2,3. \quad (\text{balance of forces}) \\ u = 0 & \text{on } \Gamma_0 \\ \sum_{j=1}^3 \sigma_{ij}(u) \nu_j = g_i & \text{on } \Gamma_1, \quad 1 \leq i \leq 3. \end{cases}$$

NPTEL

Now, we want to know, what is the material the body is made of, and how the stress and the strain are connected. So, the

**stress- strain relationship** depends on the material  $\Omega$  is made of and it is called the constitutive law. In this case we will assume that it is a linear law, which we call **Hooke's law**. So, this is linear elasticity, so there is a linear relationship between the stress and the strain, which we will now write down.

So, we have

$$\sigma_{i,j}(u) = \lambda \left( \sum_{j=1}^3 \varepsilon_{i,j}(u) \right) \delta_{i,j} + 2\mu \varepsilon_{i,j}(u).$$

$\lambda \geq 0$ ,  $\mu > 0$  these are called Lama's coefficients.

And  $\delta_{i,j}$  is the Kronecker symbol. So, that is equal to 1, if i equals j and 0 if i is not equal to j.

So, this is the stress-strain relationship. So, lambda could be greater than or equal to 0 and mu strictly positive. These are called the lambda Lama's coefficients. So, the

**elasticity system** is the following set of equations

$$-\sum_{j=1}^3 \frac{\partial}{\partial x_j} (\sigma_{i,j}(u)) = f_i \text{ in } \Omega, \quad i = 1, 2, 3.$$

$$u = 0, \quad \text{on } \Gamma_0$$

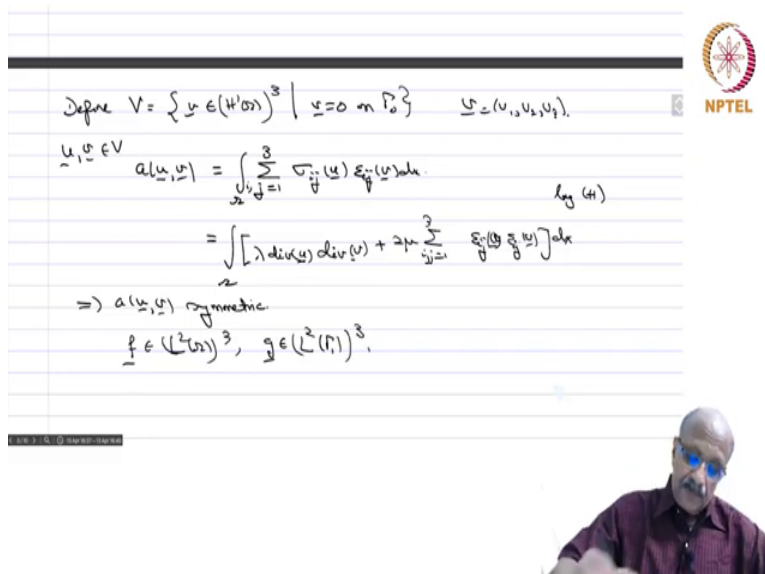

$$\sum_{j=1}^3 \frac{\partial}{\partial x_j} (\sigma_{i,j}(u)) \nu_j = g_i \text{ in } \Gamma_1, \quad i = 1, 2, 3$$

So, this is the elasticity system. So,  $H$  we will call  $H$  as **Hooke's law** and  $E$ , as the elasticity system.

So, we want to write down a weak formulation. So, we as we know from past experience, we are this is a second order equation and the system of equations. So, we are going to work on a product of  $H^1(\Omega)$ . And also we have to put the condition  $u$  equals 0 on comma naught, we have

to impose it, because that is essential boundary condition, namely the Dirichlet boundary condition.

(Refer Slide Time: 8:04)

Define  $V = \{v \in (H^1(\Omega))^3 \mid v = 0 \text{ on } \Gamma_0\}$   $v = (v_1, v_2, v_3)$ .

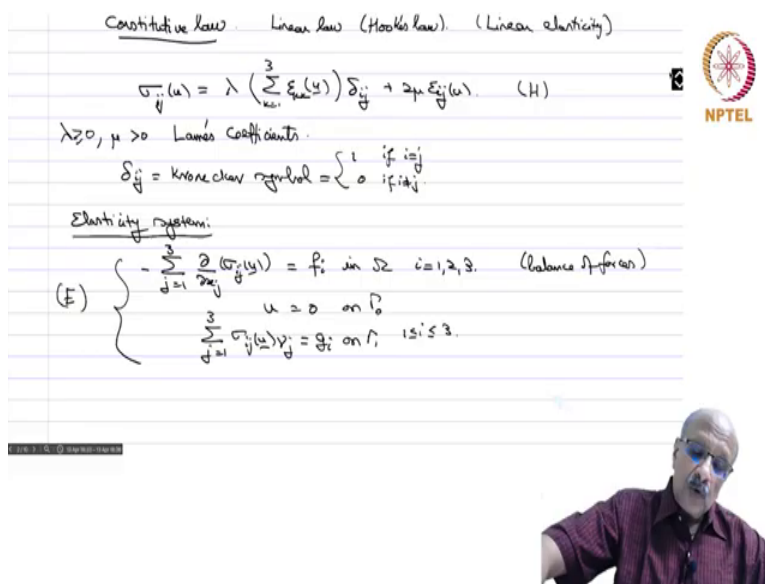

For  $u, v \in V$

$$a(u, v) = \int_{\Omega} \sum_{i,j=1}^3 \sigma_{ij}(u) \varepsilon_{ij}(v) dx \quad \text{by (4)}$$

$$= \int_{\Omega} \left[ \lambda \operatorname{div}(u) \operatorname{div}(v) + 2\mu \sum_{i,j=1}^3 \varepsilon_{ij}(u) \varepsilon_{ij}(v) \right] dx$$

$\Rightarrow a(u, v)$  symmetric

$f \in (L^2(\Omega))^3, g \in (L^2(\Gamma))^3$ .

Constitutive law: Linear law (Hooke's law): (Linear elasticity)

$$\sigma_{ij}(u) = \lambda \left( \sum_{k=1}^3 \varepsilon_{kk}(u) \right) \delta_{ij} + 2\mu \varepsilon_{ij}(u) \quad (H)$$

$\lambda > 0, \mu > 0$  Lamé coefficients.

$\delta_{ij} = \text{Kronecker symbol} = \begin{cases} 1 & \text{if } i=j \\ 0 & \text{if } i \neq j \end{cases}$

Elasticity system:

$$(E) \begin{cases} -\sum_{j=1}^3 \frac{\partial \sigma_{ij}(u)}{\partial x_j} = f_i & \text{in } \Omega, \quad i=1,2,3. \quad (\text{balance of forces}) \\ u = 0 & \text{on } \Gamma_0 \\ \sum_{j=1}^3 \sigma_{ij}(u) \nu_j = g_i & \text{on } \Gamma, \quad 1 \leq i \leq 3. \end{cases}$$

So, we define  $V = \{v \in (H^1(\Omega))^3 \mid v = 0 \text{ on } \Gamma_0\}$ , So, we would be have three components  $v = (v_1, v_2, v_3)$ , So, we define

$$a(u, v) = \int_{\Omega} \sum_{j=1}^3 (\sigma_{ij}(u)) \varepsilon_{ij}(v) dx$$

Now, we put in Hooke's law. So, by  $H$ , so what is Hooke's law,  $\sigma_{ij}$  if  $u$  is a lambda epsilon  $\delta_{ij}$  plus  $2\mu \varepsilon_{ij}$  of  $u$ . So,  $2\mu \varepsilon_{ij}$  of  $u$  to give you here  $i, j$  equal to 1 to 3. And therefore, the so the second term. So, you will get integral on  $\Omega$ .

So, plus  $2\mu \varepsilon_{ij}$  of  $u$ ,  $\varepsilon_{ij}$  of  $v$   $dx$ , and the first term will give you epsilon  $i$  only when  $i$  equals  $j$  you will have  $\delta_{ij} = 1$ . And therefore, so  $\delta_{ij}$  is 1 only if  $i$  equals  $j$ . So, this term will not survive for any other  $ij$  and therefore, when  $i$  equals  $j$   $x$  is on  $k$ ,  $k$  is nothing but, so epsilon  $k$ ,  $k$  is  $\frac{1}{d} \frac{du_k}{dx_k}$  plus  $\frac{1}{d} \frac{du_k}{dx_k}$  a power half. So, half so that is equal to  $\frac{1}{d} \frac{du_k}{dx_k}$  sigma over 1 to 3 will give you just the divergence of  $u$ .

So, this will give you lambda divergence of  $u$ , times divergence of  $v$  plus  $2\mu$  sigma over  $i, j$  equal to 1 to 3, of  $\varepsilon_{ij}(v)$ . So, this form implies that  $a(u, v)$  is symmetric, the first form does not tell you, but the second form tells you that it is a symmetric bilinear form. So,  $f$  in  $L^2(\Omega)$  power 3 and  $g$  belong to  $(L^2(\Omega))^3$ .

Refer Slide Time: 11:05)

Weak formulation. Find  $u \in V$  s.t.

$$a(u, v) = \int_{\Omega} f v \, dx + \int_{\Gamma_1} g v \, d\sigma.$$

$u$  weak form.  $u$  is not enough, we can recover  $(f)$ .

$v$  is not enough,  $u, v \in V$

$$a(u, v) = \int_{\Omega} \sum_{i,j=1}^3 \sigma_{ij}(u) \frac{\partial v}{\partial x_j} \, dx. \quad \sigma_{ij} = \sigma_{ji} \quad \text{symmetric}$$

$$= \int_{\Omega} \sum_{i,j=1}^3 \sigma_{ij}(u) \frac{\partial u_i}{\partial x_j} \, dx$$

$$\int_{\Omega} \sum_{i,j=1}^3 \sigma_{ij}(u) \frac{\partial v}{\partial x_j} \, dx$$

$$= - \int_{\Omega} \sum_{i,j=1}^3 \frac{\partial}{\partial x_j} \sigma_{ij}(u) v_i \, dx + \int_{\Gamma_1} \sigma_{ij}(u) v_i n_j \, d\sigma$$

$v \in (W^1_0(\Omega))^3$

$$(u) \Rightarrow - \int_{\Omega} \sum_{i,j=1}^3 \frac{\partial}{\partial x_j} \sigma_{ij}(u) v_i \, dx = \int_{\Omega} f v \, dx$$

$v \in \mathcal{D}(\Omega) \quad u = (u, \sigma) \quad (\sigma, u)$

$$\Rightarrow - \sum_{i,j=1}^3 \frac{\partial}{\partial x_j} \sigma_{ij}(u) = f_i \quad \text{in } \mathcal{D}(\Omega) \quad i=1,2,3.$$

$$\begin{aligned} \underline{u} &= (u, v, w) \quad (0, 0, 0), (0, 0, 0) \\ \Rightarrow -\sum_{j=1}^3 \frac{\partial \sigma_{ij}(u)}{\partial x_j} &= f_i \text{ in } \Omega, \quad i=1,2,3. \\ \underline{u} &= 0 \text{ on } \Gamma_0 \quad \therefore \underline{u} \in V. \end{aligned}$$

$$\begin{aligned} \int_{\Gamma_1} \sigma_{ij}(u) \nu_j \nu_i \, d\sigma &= \int_{\Gamma_1} g_i \nu_i \, d\sigma \quad \forall \underline{u} \in V. \\ \Rightarrow \sigma_{ij}(u) \nu_j &= g_i \text{ on } \Gamma_1. \end{aligned}$$

Prof. S. Kesavan  
Department of Mathematics  
The Institute of Mathematical Sciences

$$\begin{aligned} \text{Let } \underline{u} &= (u, v, w) \text{ be displacement vector.} \\ \text{Strain tensor } \epsilon_{ij}(u) &= \frac{1}{2} \left( \frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right), \quad 1 \leq i, j \leq 3. \\ \text{Stress tensor } (\sigma_{ij}(u))_{i,j=1}^3 & \quad (\text{Symmetric tensor}) \end{aligned}$$

Stress-Strain relationship depends on the material  $\Omega$  is made of.  
Constitutive law: Linear law (Hooke's law) (Linear elasticity)

$$\sigma_{ij}(u) = \lambda \left( \sum_{k=1}^3 \epsilon_{kk}(u) \right) \delta_{ij} + 2\mu \epsilon_{ij}(u). \quad (H)$$

$\lambda > 0, \mu > 0$  Lamé's coefficients.

$$\delta_{ij} = \begin{cases} 1 & \text{if } i=j \\ 0 & \text{if } i \neq j \end{cases}$$

$$a(u, v) = \int_{\Omega} [\lambda \operatorname{div}(u) \operatorname{div}(v) + 2\mu \sum_{i,j=1}^3 \varepsilon_{ij}(u) \varepsilon_{ij}(v)] dx$$

$\Rightarrow a(u, v)$  symmetric

Let  $f \in (L^2(\Omega))^3$ ,  $g \in (L^2(\Gamma))^3$ .

Weak formulation. Find  $u \in V$  s.t.

$$a(u, v) = \int_{\Omega} f \cdot v dx + \int_{\Gamma} g \cdot v d\sigma \quad \forall v \in V$$

$u$  weak soln. smooth enough, we can recover  $(E)$ .

$v$  smooth enough,  $u, v \in V$ .

So, weak formulation find  $u \in V$ , so the trace is  $v$  such that  $a(u, v)$  equals  $\int_{\Omega} f \cdot v dx$  plus  $\int_{\Gamma} g \cdot v d\sigma$ . So, this is the weak formulation, so you have the linear form, you have the bilinear form, which is symmetric and therefore, we want to know which is.

So, we want to know how we came to this? So, we want to justify this weak formulation. So, if  $u$  were a weak solution smooth enough, we can recover  $E$  how? So, if  $v$  is also smooth enough  $u \cdot v$  in  $V$ . So, you have  $a(u, v)$  equals  $\int_{\Omega} \sum_{i,j=1}^3 \varepsilon_{ij}(u) \varepsilon_{ij}(v) dx$  plus  $\int_{\Gamma} \sum_{i,j=1}^3 \varepsilon_{ij}(u) \varepsilon_{ij}(v) d\sigma$ . But  $\sigma$  is symmetric stress, tensor is always a symmetric tensor. So, I do not know if I said it here, this is symmetric tensor.

So, if you using that fact this is it is easy to check, that this is  $\sigma_{ij}$  equals 1 to 3 and that is equal to  $\int_{\Omega} \sum_{i,j=1}^3 \sigma_{ij} \varepsilon_{ij}(u) \varepsilon_{ij}(v) dx$ . So, the half will get absorbed. So,  $\sigma_{ij}$  equals  $\sigma_{ji}$ . So, this there will be matching terms here, repeated twice each term will be repeated twice of this kind and so the half will go away and therefore, you will only get this  $dx$ .

And that if you use green's theorem, this will be minus  $\int_{\Gamma} \sum_{i,j=1}^3 \sigma_{ij} \varepsilon_{ij}(u) v_i d\sigma$  plus  $\int_{\Omega} \sum_{i,j=1}^3 \sigma_{ij} \varepsilon_{ij}(u) \varepsilon_{ij}(v) dx$  and then the integral on the boundary on  $\gamma$  naught  $v$ , naught  $v$  is 0. So, you will only have an integral on  $\gamma$ ,  $\sum_{i,j=1}^3 \sigma_{ij} \varepsilon_{ij}(u) v_i$  and because we turned over the  $j$ , derivative you have  $d_j u_i \sigma_{ij}$ .

So, now if you take  $v$  is in  $D(\Omega)$ , then the boundary term will disappear and therefore, you will have. So, the weak solution call this  $W$ ,  $W$  will imply that minus integral on  $\Omega$   $\sigma_{ij}$  equals 1 to 3 d by d  $x_j$ ,  $\sigma_{ij}$  of  $u$ ,  $v_i$  d equals integral  $f$  dot  $v$  over  $\Omega$   $dx$ , there also there will be no boundary integral term.

So, now you successively take  $v \in \Omega$  and you take  $v = (v, 0, 0)$  or  $v = (0, v, 0)$  or  $v = (0, 0, v)$  sub 1 by 1. So, you will get that minus  $\sigma_{ij}$  equals 1 to 3 d by d  $x_j$  of  $\sigma_{ij}$   $u$  equals  $f_i$  in  $D'(\Omega)$   $i$  equals 1, 2, 3, and then of course you have that  $u$  equal to 0 on  $\Gamma_R$ , since  $u$  belongs to  $v$ . So, we only have to look at the other boundary condition. So, then of course you know that, this can be made if everything is smooth enough, this relation in  $L^2$  as you can see from these equations here.

And therefore, going back to this equation here, you will get  $\sigma_{ij}$  integral on  $\Gamma_1$ ,  $\sigma_{ij}$  of  $u$   $v_i$   $\mu_j$  d  $\sigma$  equal to 0 for all  $v$  in  $V$ , not equal to 0 equals integral on  $\Gamma_1$  of  $g_i$  dot  $v$  d  $\sigma$  for every  $v$  in  $V$  and from this you can easily go back and get that  $\sigma_{ij}$  of  $u$   $\mu_j$  is equal to  $g_i$  on  $\Gamma_1$ . So, this is the so you cannot recover the original system by means of from the weak formulation.

(Refer Slide Time: 17:35)

$$\int_{\Gamma_1} \sigma_{ij}(u) \mu_j v_i d\sigma = \int_{\Gamma_1} g_i v_i d\sigma \quad \forall u \in V.$$

$$\Rightarrow \sigma_{ij}(u) \mu_j = g_i \text{ on } \Gamma_1.$$

Existence & uniqueness of the weak solution

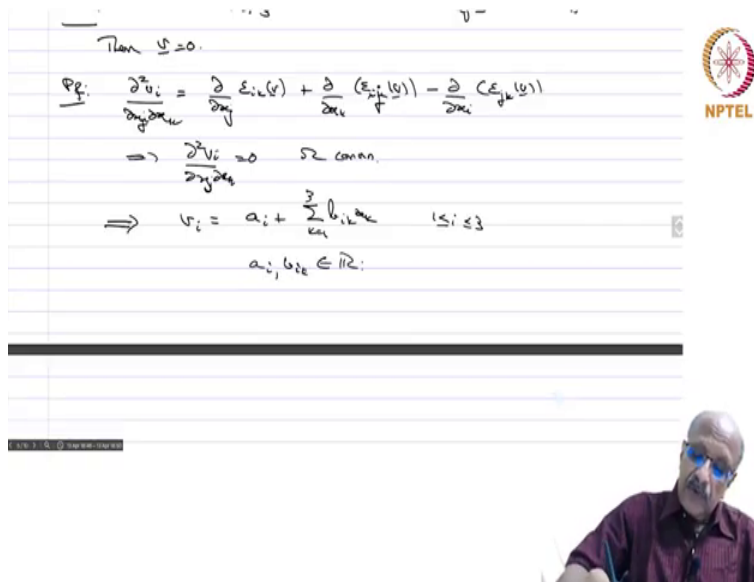

Lemma Let  $v = (v_1, v_2, v_3) \in V$  be such that  $\varepsilon_{ij}(v) = 0 \quad \forall 1 \leq i, j \leq 3$ .

Then  $v = 0$ .

Pr.  $\frac{\partial^2 v_i}{\partial x_j \partial x_k} = \frac{\partial}{\partial x_j} \varepsilon_{ik}(v) + \frac{\partial}{\partial x_k} \varepsilon_{ji}(v) - \frac{\partial}{\partial x_i} \varepsilon_{jk}(v)$

$$\Rightarrow \frac{\partial^2 v_i}{\partial x_j \partial x_k} = 0 \quad \text{for all } i, j, k.$$

Then  $v = 0$ .

Pr.  $\frac{\partial^2 v_i}{\partial x_j \partial x_k} = \frac{\partial}{\partial x_j} (\varepsilon_{ik}(v)) + \frac{\partial}{\partial x_k} (\varepsilon_{ij}(v)) - \frac{\partial}{\partial x_i} (\varepsilon_{jk}(v))$

$\Rightarrow \frac{\partial^2 v_i}{\partial x_j \partial x_k} = 0$  for all  $i, j, k$ .

$\Rightarrow v_i = a_i + \sum_{k=1}^3 b_{ik} x_k \quad 1 \leq i \leq 3$

$a_i, b_{ik} \in \mathbb{R}$ .

So, now we want to study the existence and uniqueness of the weak solution. So, we want to apply **Lax Milgram lemma**, so we have to show that it is elliptic. So, we now proceed to do that and for that we first need a preliminary

**Lemma.** Let  $v = (v_1, v_2, v_3)$ , belong to capital  $V$  be such that  $\varepsilon_{ij} = 0$  for all  $1 \leq i, j \leq 3$ . Then  $v = 0$ .

**Proof,** we have already seen again in the proof of the **Khan's inequality** that

$$\frac{\partial^2 v_i}{\partial x_j \partial x_k} = \frac{\partial}{\partial x_j} (\varepsilon_{ik}(v)) + \frac{\partial}{\partial x_k} (\varepsilon_{ij}(v)) - \frac{\partial}{\partial x_i} (\varepsilon_{jk}(v))$$

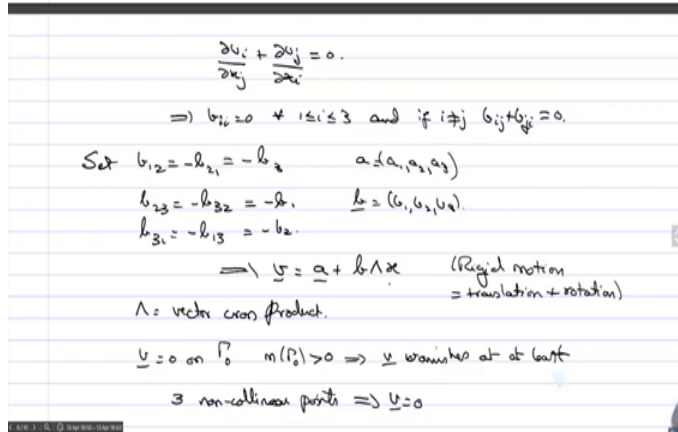

. So, since all the epsilons are 0, this implies that  $\frac{\partial}{\partial x_j} (\varepsilon_{ik}(v)) = 0, i, j, k$ .

Now,  $\Omega$  is connected, so all second derivatives vanish and therefore, this means that  $v$  is linear.

$$\text{So, } v_i = a_i + \sum_{k=1}^3 b_{ik} x_k.$$

since all the second derivative vanishes and  $\Omega$  is connected. So, now so  $a_i, b_j$  are all real numbers.

(Refer Slide Time: 20:29)

$\frac{\partial v_i}{\partial x_j} + \frac{\partial v_j}{\partial x_i} = 0.$   
 $\Rightarrow b_{ii} = 0 \quad \forall i \leq 3 \quad \text{and if } i \neq j \quad b_{ij} + b_{ji} = 0.$   
 Set  $b_{12} = -b_{21} = -b_3 \quad a = (a_1, a_2, a_3)$   
 $b_{23} = -b_{32} = -b_1 \quad b = (b_1, b_2, b_3)$   
 $b_{31} = -b_{13} = -b_2$   
 $\Rightarrow v = a + b \wedge x \quad (\text{Rigid motion} = \text{translation} + \text{rotation})$   
 $\wedge = \text{vector cross product.}$   
 $v = 0 \text{ on } P_0 \quad m(P_0) > 0 \Rightarrow v \text{ vanishes at at least}$   
 $3 \text{ non-collinear points} \Rightarrow v = 0$

So, now you have that

$$\frac{\partial v_i}{\partial x_j} + \frac{\partial v_j}{\partial x_i} = 0,$$

and therefore, you have that  $b_{ii} = 0$ , for all  $i$  and if  $i$  is not equal to  $j$ ,

$$b_{ij} + b_{ji} = 0, \text{ for } i \neq j \text{ and } b_{ii} = 0.$$

So, it is just algebra, you just plug it in here differentiate these expressions, you will get this.

So, now you put set  $b_{12} = -b_{21} = -b_3 = -b_{32} = -b_1$  and

$$b_{31} = -b_{13} = -b_2.$$

And then  $a = (a_1, a_2, a_3)$ , and  $b = (b_1, b_2, b_3)$ , then you will get that

$$v = a + b \wedge x$$

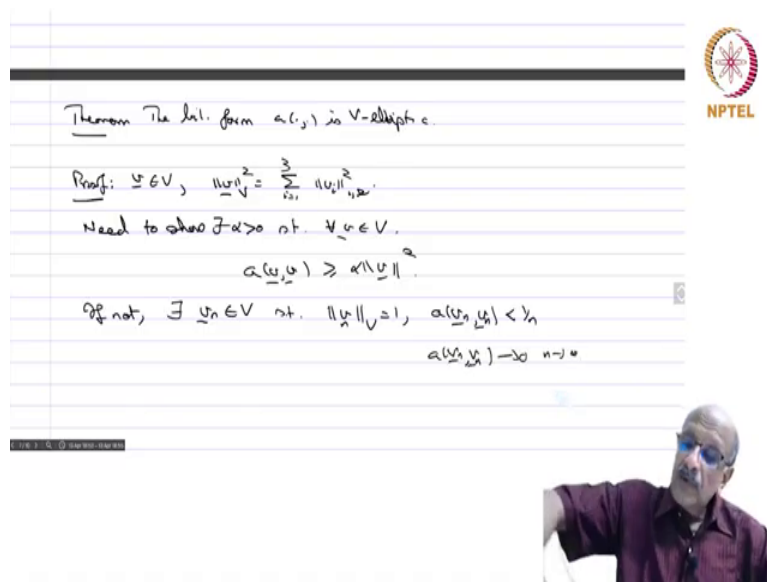

where  $\wedge$  is the vector cross product. So, you just have to check out these calculations.

So, this so this means that, so what does this what do we actually prove? So, when you have the there is no strain in the thing that means, there is no deformation at all. So, we are just moving

the body rigidly, it is just a rigid translation. So, rigid motion equals translation plus a rotation, that is exactly what each  $a$  is the translation part,  $b \times x$  vector product is the rotation part. And therefore, if you have a deformation in which there is no strain, that means the deformation tensor is 0, then it has to be a rigid body motion, that is all we have saw. So,  $v$  equals  $a$  plus  $b \times x$ .

And now  $v$  equal to 0 on gamma naught, a measure of gamma naught is strictly positive and this implies that  $v$  vanishes at, at least 3 non-collinear points and that will imply that  $v$  is equal to 0. So, if you put this equal to 0, then you will get you to put this equal 0 at 3 non-colonial points, then it will happen that  $v$  equal to 0. So, that is just some linear algebra, which you can check. So, now that we have this lemma,

(Refer Slide Time: 23:48)

Theorem The bil. form  $a(\cdot, \cdot)$  is  $V$ -elliptic.

Proof:  $u \in V$ ,  $\|u\|_V^2 = \sum_{i=1}^3 \|u_i\|_{V_i}^2$ .

Need to show  $\exists \alpha > 0$  s.t.  $\forall u \in V$ ,

$$a(u, u) \geq \alpha \|u\|_V^2.$$

If not,  $\exists u_n \in V$  s.t.  $\|u_n\|_V = 1$ ,  $a(u_n, u_n) < \frac{1}{n}$ ,  $a(u_n, u_n) \rightarrow 0$  as  $n \rightarrow \infty$ .

Proof:  $v \in V$ ,  $\|v\|_V^2 = \sum_{i,j=1}^3 \|v_{ij}\|_{1,\Omega}^2$ .  
 Need to show  $\exists \alpha > 0$  s.t.  $\forall v \in V$ ,  
 $a(v,v) \geq \alpha \|v\|_V^2$ .  
 If not,  $\exists v_n \in V$  s.t.  $\|v_n\|_V = 1$ ,  $a(v_n, v_n) < 1/n$ .  
 $a(v_n, v_n) \rightarrow 0$  as  $n \rightarrow \infty$ .  
 $\Rightarrow \varepsilon_{ij}(v_n) \rightarrow 0$  in  $L^2(\Omega)$   $\forall i,j=1,2$ .  
 $\{v_n\}$  bounded in  $V$ , so bounded  $\forall \varepsilon_{ij}(v_n) \in L^2(\Omega)$ .  
 $\Rightarrow$  Rellick-Kondrakov  $\Rightarrow \exists$  subseq.  $n_k$  s.t.  
 $v_{n_k} \rightarrow v$  in  $(L^2(\Omega))^3$ .

We can now state the following theorem.

**Theorem.:** The bilinear form  $a(\cdot)$  is  $V$  elliptic. So,

**Proof,** so for  $v \in V$ , what do you have that

$$\|v\|_V^2 = \sum_{i=1}^3 \|v_i\|_{1,\Omega}^2.$$

So, we need to show, so need to show there exists alpha positive, such that for all  $v \in V$ , you have

$$a(v,v) \geq \alpha \|v\|_V^2$$

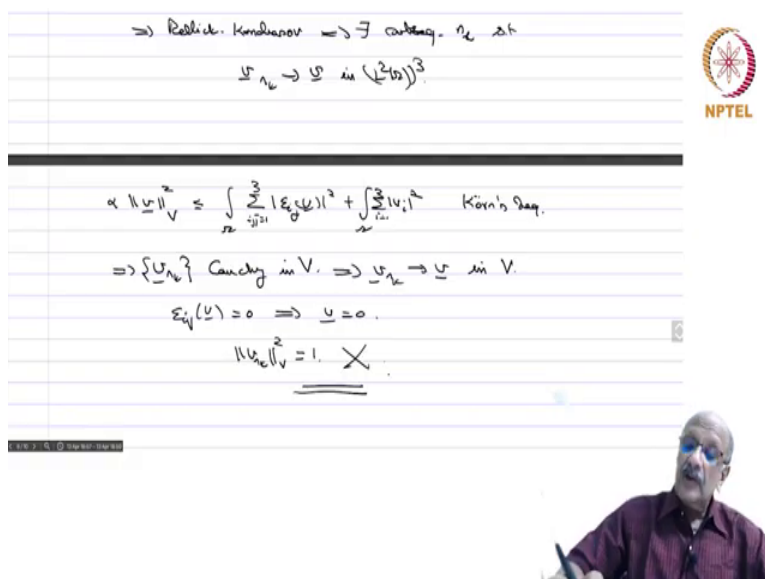

So, if not then for every however small an  $\alpha$  you take, you will get a contradiction to this, that means there is a vector which is not supplying this one.

So, I can put take  $\alpha = 1/n$  and I can also normalize  $v$ , we have done this kind of thing there exists  $v_n \in V$ , such that  $\|v_n\| = 1$  and

$a(v_n, v_n) \rightarrow 0$  as  $n$  tends to infinity. But what is  $a(v_n, v_n)$ ? If you look at  $a(v, v)$ , it is a sum of 2 squares one is divergence  $u \cdot v$  square plus  $\varepsilon_{ij}(v)$  square.

So, this means that, so this implies that  $\varepsilon_{ij}(v_n) \rightarrow 0$ , in  $L^2(\Omega)$  for all  $1 \leq i, j \leq 3$ . So,  $v_n$  is bounded in  $V$ , and  $\Omega$  is bounded  $V$  is of course contained in  $(H^1(\Omega))^3$ . And therefore, **Rellich-Kondrachov** implies there exists a subsequence  $\{v_{n_k}\}$ , such that  $v_{n_k}$  converges to some  $v \in (L^2(\Omega))^3$ . Because it is bounded in  $(H^1(\Omega))^3$ . And therefore, it converges to some  $v \in (L^2(\Omega))^3$ .

(Refer Slide Time: 26:57)

$\Rightarrow$  Rellich-Kondrachov  $\Rightarrow \exists$  subseq.  $n_k$  st  
 $v_{n_k} \rightarrow v$  in  $(L^2(\Omega))^3$ .

---

$\alpha \|v\|_V^2 \leq \int_{\Omega} \sum_{i,j=1}^3 |\varepsilon_{ij}(v)|^2 + \int_{\Omega} \sum_{i=1}^3 |v_i|^2$  Korn's Ineq.

$\Rightarrow \{v_{n_k}\}$  Cauchy in  $V$ .  $\Rightarrow v_{n_k} \rightarrow v$  in  $V$ .

$\varepsilon_{ij}(v) = 0 \Rightarrow v = 0$ .

$\|v\|_V^2 = 1$ .  $\times$

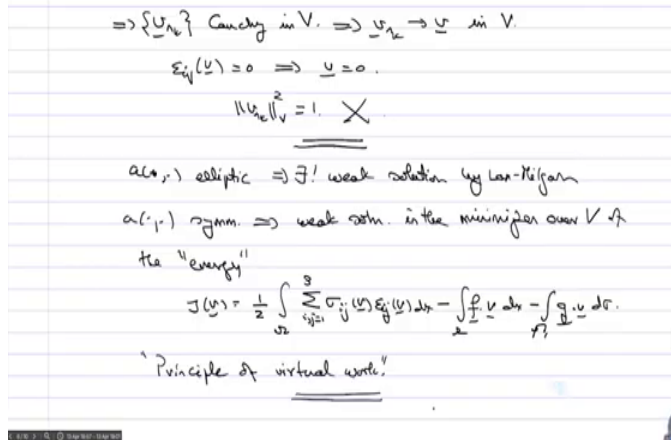

Now, what is we also have **Khan's inequality**. What is Khan's inequality

$$\|v\|_V^2 \leq \int_{\Omega} \sum_{i,j}^3 |\varepsilon_{ij}(v)|^2 + \sum_i^3 |v_i|^2$$

This is Khan's inequality.

Now,  $\varepsilon_{ij}(v) \rightarrow 0$ , and this is convergent in  $L^2$ . So, this means that  $v_{n_k}$  is Cauchy in  $V$ , and this implies that  $v_{n_k}$  converges to  $V$ , in fact in capital. So, since it already converges in  $L^2$ , so it will have to converge in  $V$ . But then  $\varepsilon_{ij}(v) = 0$ , this implies that  $v = 0$ , but then  $\|v\| = 1$ , and this is a contradiction. So, we have a contradiction and therefore, you know that this is elliptic.

(Refer Slide Time: 28:24)

$\Rightarrow \{u_n\}$  Cauchy in  $V$ .  $\Rightarrow u_n \rightarrow u$  in  $V$ .  
 $\varepsilon_{ij}(u) = 0 \Rightarrow u = 0$ .  
 $\|u_n\|_V^2 = 1$ . ~~X~~  
also,  $a$  elliptic  $\Rightarrow \exists!$  weak solution by Lax-Milgram  
 $a(\cdot, \cdot)$  symm.  $\Rightarrow$  weak soln. is the minimizer over  $V$  of the "energy"  
 $J(u) = \frac{1}{2} \int_{\Omega} \sum_{i,j=1}^3 \sigma_{ij}(u) \varepsilon_{ij}(u) dx - \int_{\Omega} f \cdot u dx - \int_{\Gamma_1} g \cdot u d\sigma$ .  
"Principle of virtual work"

Therefore,  $a$  is elliptic, elliptic implies there exists a unique weak solution by **Lax Milgram** and  $a$  is symmetric, implies weak solution is the minimizer over  $V$  of the strain energy. of the energy

$$J(v) = \frac{1}{2} \int_{\Omega} \sum_{i,j}^3 \sigma_{ij}(v) \varepsilon_{ij}(v) dx - \left( \int_{\Omega} f \cdot v dx + \int_{\Gamma_1} g \cdot v d\sigma(x) \right).$$

And this is the energy of the system.

And so for equilibrium you need that it has to be minimized and that is exactly called the principle of virtual work namely, the elasticity system, solution is nothing but the minimizer of the energy, so this thing. So, this is the existence- uniqueness and the weak formulation for the system of elasticity.
