REGULARITY

$A$  infl. gen. of a contraction semigroup  $\{S(t)\}_{t \geq 0}$

$D(A^k) = \{u \in D(A) \mid Au \in D(A^{k-1})\}$

$k \geq 2$  pos. integer

$D(A^k) = \{u \in D(A^{k-1}) \mid Au \in D(A^{k-1})\}$

$u \in D(A^k) \Rightarrow Au = A^{k-1}(Au)$

Lemma.  $A$  infl. gen. of a contraction semigroup on a Banach sp.  $X$ .

Then  $D(A^2)$  is dense in  $D(A)$  (with the graph norm)

We will now talk about Regularity. Regularity means when the data is more the solution is smarter than what we normally expect it to be. So, if you look at  $A$  infinitesimal generator is  $\{A(t)\}$  then in look at think of the 2 examples which we saw. We saw that the space was  $H^1_0$  and in case of  $u \mapsto Au$  equals  $u$  dash the domain was  $H^1_0$ . And in case of  $Au$  equals Laplacian  $u$  the domain was  $H^2_0$ .

So, the domain of the operator is normally a space of smoother functions than the ambient space where we are working. Now, if we look at  $A$  applied to itself again  $A^2$  that will be an unbounded operator whose domain will be even smoother for instance if you have  $u$  dash if you apply it twice you get  $u$  double dash. So, you would need at least  $H^2$  functions to make sense.

Similarly, if you have Laplacian and then you apply again Laplacian square then you get  $H^4$  should be the space where these functions will be ultimately coming into  $H^2$  and therefore, the

higher the domain or power of the operator is the domain will become smoother and smoother functions. And therefore, if your the initial data belongs to those then you can expect the solution to be smooth also. So, that is the principle on which we are going to work today.

So,  $A$  is infinitesimal generators of a semigroup and so, we define

$$D(A^2) = \{u \in D(A): Au \in D(A)\}.$$

And if more generally if  $k \geq 2$  is a positive integer. Then we define

$$D(A^k) = \{u \in D(A^{k-1}): A^{k-1}u \in D(A)\}.$$

and then we define  $A^k(u) = A^{k-1}(Au)$ . So, for  $u \in D(A^k)$ ,  $A^k(u) = A^{k-1}(Au)$  because it is in the domain of  $Au$ .

$Au$  is in the domain and therefore,  $A^{k-1}(u)$  and  $Au$  is well defined. So, this is how we define the higher order higher powers of the generator of an infinitesimal semi group. So, then we have the following

**Lemma:**  $A$  infinitesimal generator of a contraction semigroup on a Banach space. Then  $D(A^2)$  is dense in  $D(A)$  remember whenever we want  $D(A)$  to be a independent Banach space so we need to put it with the graph norm. So, this is the lemma which we want to do

(Refer Slide Time: 4:10)

$$u \in D(A^*) \Rightarrow A^*u = A^{*-1}(Au)$$

Lemma. A infl. gen. of a contraction semigroup on a Banach sp.:

Then  $D(A^*)$  is dense in  $D(A)$  (with the graph norm).

Pr.  $u \in D(A)$ . Define  $u_\lambda = \lambda R(\lambda)u$ ,  $\lambda > 0$ .

$$u_\lambda \in D(A) \quad u_\lambda \rightarrow u$$

$$u_\lambda = R(\lambda)(\lambda u), \quad (\lambda I - A)u_\lambda = \lambda u.$$

$$u = \lambda^{-1}(\lambda I - A)u_\lambda.$$

$$\Rightarrow Au_\lambda = \lambda u_\lambda - \lambda u \in D(A)$$

**Proof.** So, what do you want to show? You want to show that  $u \in D(A)$ . So, we want to produce a sequence or a set of approximations which are in  $D(A^2)$ . And such that they approximate  $u$  in the sense of the graph norm. So, let us define

$$u_\lambda = \lambda R(\lambda)u, \quad \lambda > 0.$$

Then  $u_\lambda \in D(A)$  we know that because  $R(\lambda)$  has its range in  $D(A)$ .

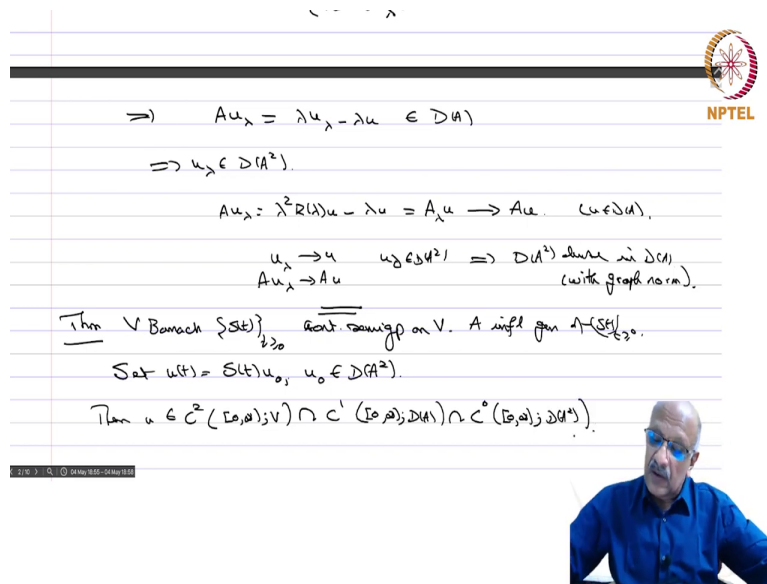

And further you know that  $R(\lambda)u$  always converges to  $u$ . And therefore,  $u_\lambda$  converges to  $u$ . So, this is the one first lemma we proved.

Therefore, we know this so this we know. Now, what about so,  $u_\lambda$  is nothing but  $R(\lambda)u_\lambda$ . So, that means  $(\lambda I - A)u_\lambda = \lambda u$ . So,

$$u = \frac{1}{\lambda}(\lambda I - A)u_\lambda.$$

So, what is  $Au_\lambda$ ?  $Au_\lambda = \lambda u_\lambda - \lambda u$  from this equation here. And that we know belongs to  $D(A)$  because  $u_\lambda$  belongs to  $D(A)$  and  $u$  also belongs to  $D(A)$ . So, the  $Au_\lambda \in D(A)$ .

(Refer Slide Time: 6:17)

Handwritten notes on a slide:

$$\Rightarrow Au_\lambda = \lambda u_\lambda - \lambda u \in D(A)$$

$$\Rightarrow u_\lambda \in D(A^2)$$

$$Au_\lambda = \lambda^2 R(\lambda)u - \lambda u = A_\lambda u \rightarrow Au \quad (u \in D(A)),$$

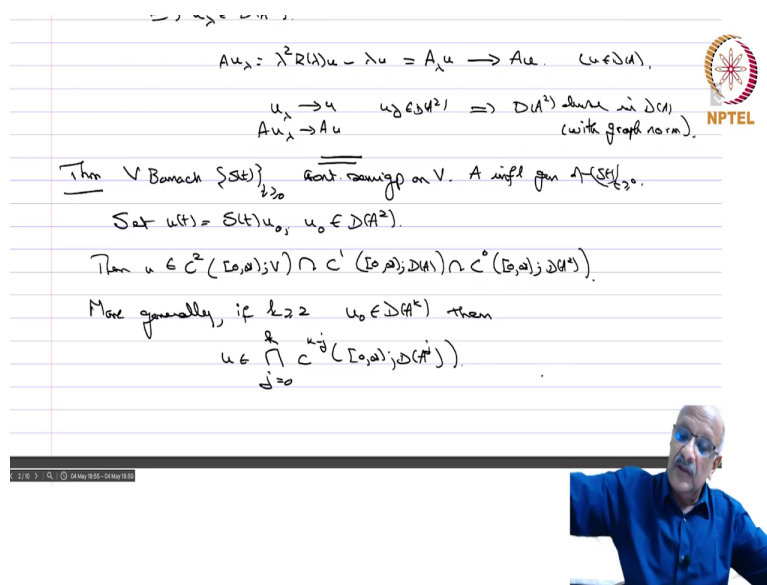

$$\begin{matrix} u_\lambda \rightarrow u & u_\lambda \in D(A^2) \Rightarrow D(A^2) \text{ dense in } D(A) \\ Au_\lambda \rightarrow Au & \text{(with graph norm)} \end{matrix}$$

Then  $\forall$  Banach  $\{S(t)\}_{t \geq 0}$  semi-group on  $V$ . A right gen  $A(S(t))_{t \geq 0}$ .

Set  $u(t) = S(t)u_0$ ,  $u_0 \in D(A^2)$ .

Then  $u \in C^2([0, \infty); V) \cap C^1([0, \infty); D(A)) \cap C^0([0, \infty); D(A^2))$ .

NPTEL logo and video feed of a professor in a blue shirt.

Handwritten notes on a slide:

$$Au_\lambda = \lambda^2 R(\lambda)u - \lambda u = A_\lambda u \rightarrow Au \quad (u \in D(A)),$$

$$\begin{matrix} u_\lambda \rightarrow u & u_\lambda \in D(A^2) \Rightarrow D(A^2) \text{ dense in } D(A) \\ Au_\lambda \rightarrow Au & \text{(with graph norm)} \end{matrix}$$

Then  $\forall$  Banach  $\{S(t)\}_{t \geq 0}$  semi-group on  $V$ . A right gen  $A(S(t))_{t \geq 0}$ .

Set  $u(t) = S(t)u_0$ ,  $u_0 \in D(A^2)$ .

Then  $u \in C^2([0, \infty); V) \cap C^1([0, \infty); D(A)) \cap C^0([0, \infty); D(A^2))$ .

More generally, if  $k \geq 2$ ,  $u_0 \in D(A^k)$  then

$$u \in \bigcap_{j=0}^k C^j([0, \infty); D(A^j)).$$

NPTEL logo and video feed of a professor in a blue shirt.

So, therefore, you have that  $u_\lambda \in D(A^2)$  further  $Au_\lambda = \lambda u_\lambda$  which is  $\lambda^2 R(\lambda)u - \lambda u$  from this equation and the definition of  $\lambda$ . But this is nothing but  $A_\lambda u$  and  $A_\lambda u$  of course converges to  $Au$  we know because  $u \in D(A)$ . So, you have  $u_\lambda$  converges to  $u$  and  $Au_\lambda$  converges to  $Au$ .

of  $u$  and  $u_\lambda \in D(A^2)$ . And therefore, this implies  $D(A^2)$  square dense in  $D(A)$  with graph norm. So, that proves that lemma.

So, now we have a nice theorem. So,

**Theorem:**  $V$  Banach space  $\{S(t)\}_{t \geq 0}$  contraction semigroup on  $V$  and  $A$  infinitesimal generator of  $\{S(t)\}_{t \geq 0}$ . Set  $u(t) = S(t)u_0$ , where  $u_0 \in D(A^2)$ . So, we are assuming now  $u_0$  usually we can solve the differential equation if  $u_0 \in D(A)$  we are now assuming further smoothness as I explained earlier we are assuming it is in  $D(A^2)$ .

So, we expect the solution to be smooth then  $u$  belongs to  $C^2$ . So, it is usually it was in  $C^1$  now it is in  $u \in C^2([0, \infty); V) \cap C^1([0, \infty]; D(A)) \cap C([0, \infty]; D(A^2))$ . So, the solution is very smooth I mean it is twice differentiable.

And the  $u_t$  itself is very smooth it belongs to  $D(A^2)$ . For more generally if  $k$  greater or equal to 2 it is a positive integer and  $u_0 \in D(A^k)$ . Then

$$u \in \bigcap_{j=0}^k C^{k-j}([0, \infty); D(A^j)).$$

So, this is the general theorem. So, we have a lot of smoothness in the case of the contraction semigroup.

(Refer Slide Time: 09:56)

Proof: Let  $u_0 \in D(A^2)$ ,  $Au_0 \in D(A)$ ,  $v(t) = S(t)Au_0$ .  
 $v(t)$  cont. diffble.  $v'(t) = Av(t)$   $v(0) = Au_0$ .  
 $v(t) \in D(A)$   $t \geq 0$ .  
 $v(t) = S(t)Au_0 = AS(t)u_0 = Au(t) = u'(t)$ .  
 $\Rightarrow u(t) \in D(A)$ .  $Au(t) = v(t) \in D(A) \Rightarrow u(t) \in D(A^2)$ .  
 $v \in C^1([0, \infty); V) \cap C([0, \infty); D(A))$ .  $u' = v$   
 $u \in C^2([0, \infty); V) \cap C^1([0, \infty); D(A)) \cap C^0([0, \infty); D(A^2))$ .  
 Gen case follows by induction on  $k$ .

**Proof:** the smoother the data the smoother the solution. So, let us assume so, let  $u_0 \in D(A^2)$  then  $Au_0$  belongs to  $D(A)$  that is the definition. Now, you said

$$v(t) = S(t)Au_0 = AS(t)u_0 = Au(t) = u'(t).$$

Then  $v(t)$  is differentiable and  $v'(t)$  is equal to  $A$  of  $v(t)$ . And  $v(0)$  equals  $A$  of  $u_0$ . And  $v(t)$  of course belongs to  $D(A)$  for every  $t$  positive is all standard stuff. So, now what is  $v(t)$ ?  $v(t)$  is  $S(t)$  of  $A(u_0)$  which is  $A$  of  $S(t)$  of  $u_0$  which is  $A$  of  $u(t)$  and  $A$  of  $u(t)$  is  $u'(t)$ . So,  $v(t)$  is equal to  $u'(t)$ .

Therefore, this belongs means so,  $v(t) \in D(A)$ .  $u'(t)$  is  $A$  of  $u(t)$  so, with  $u(t)$  belongs to  $D(A)$ . And  $A$  of  $u(t)$  is equal to  $v(t)$  also belongs to  $D(A)$ . So, this implies that  $u(t)$  belongs to  $D(A)^2$ . And  $u$  itself  $v$  itself belongs to  $C^1$  of  $0$  infinity with values in  $V$  intersection  $C$  of  $0$  infinity with values in  $D(A)$ . And therefore, the  $u$  and  $u'$  equal to  $v$ .

And therefore, you have  $u$  belongs to  $C^2$  intersection  $0$  infinity with values in  $V$  intersection  $C^1$  of  $0$  infinity with values in  $D(A)$ . And of course it is  $C$  of  $0$  infinity it is a continuous function and its values are in  $D(A^2)$  so, this we have. Now general case follows by induction on  $k$ . So, that is

the theorem about the regularity. Now, we want to prove one more theorem which will be useful later on probably.

(Refer Slide Time: 12:48)

Thm. V Banach  $\{S(t)\}_{t \geq 0}$  cont. semigrp,  $A$  inf. l. gen.  
 Let  $u_0 \in D(A^2)$ .  
 $u(t) = S(t)u_0$  and  $u_\lambda(t) = e^{tA_\lambda} u_0, \lambda > 0$ .  
 where  $A_\lambda = \lambda^2 R(\lambda) - \lambda I = \text{Yosida Approx.}$ . Then  
 $u_\lambda(t) \rightarrow u(t)$  as  $\lambda \rightarrow \infty$ , unif on bdd intervals of  $t$ .  
Pr. By defn.  $u_\lambda \rightarrow u$  (Hille-Yosida thm.)  
 Let  $U_\lambda(t) \approx \partial u$ .  $U'(t) = A_\lambda U(t), t > 0, U(0) = A_\lambda u_0$ .  
 $U_\lambda(t) = e^{tA_\lambda} A_\lambda u_0 = A_\lambda e^{tA_\lambda} u_0 = A_\lambda u_\lambda(t) = u'_\lambda(t)$ .  
 $U_\lambda = A_\lambda u_\lambda = A(\lambda R(\lambda))$

$u(t) = S(t)u_0$  and  $u_\lambda(t) = e^{tA_\lambda} u_0, \lambda > 0$ .  
 where  $A_\lambda = \lambda^2 R(\lambda) - \lambda I = \text{Yosida Approx.}$ . Then  
 $u_\lambda(t) \rightarrow u(t)$  as  $\lambda \rightarrow \infty$ , unif on bdd intervals of  $t$ .  
Pr. By defn.  $u_\lambda \rightarrow u$  (Hille-Yosida thm.)  
 Let  $U_\lambda(t) \approx \partial u$ .  $U'(t) = A_\lambda U(t), t > 0, U(0) = A_\lambda u_0$ .  
 $U_\lambda(t) = e^{tA_\lambda} A_\lambda u_0 = A_\lambda e^{tA_\lambda} u_0 = A_\lambda u_\lambda(t) = u'_\lambda(t)$ .  
 $U_\lambda = A_\lambda u_\lambda = A(\lambda R(\lambda)) u_\lambda$ .  

$$\| \lambda R(\lambda) u_\lambda - u \| \leq \underbrace{\| \lambda R(\lambda) \|}_{\leq 1} \| u_\lambda - u \| + \underbrace{\| \lambda R(\lambda) u - u \|}_{\rightarrow 0}$$

$$\leq \underbrace{\| u_\lambda - u \|}_{\rightarrow 0} + \underbrace{\| \lambda R(\lambda) u - u \|}_{\rightarrow 0}$$

**Theorem:** so V Banach  $\{S(t)\}_{t \geq 0}$  contraction semigroup and  $A$  infinitesimal generator let  $u_0 \in D(A^2)$ . And you take

$$u(t) = S(t)u_0 \text{ and } u_\lambda(t) = e^{tA_\lambda} u_0, \lambda > 0,$$

that is the usual solution of the differential equations. So, where  $A_\lambda = \lambda^2 R(\lambda) - \lambda I$  equals equals **Yosida approximation**.

Then  $u'_\lambda(t) \rightarrow u'(t)$  as  $\lambda \rightarrow \infty$  uniformly on bounded intervals of  $t$ . So, this is the theorem. So, we now did we define the semigroup at all we define the semigroup in fact so

**Proof:** by definition  $u_\lambda$  goes to  $u(t)$  is the Hille Yosida theorem. So, how did we produce the semigroup we simply took it as the limit of  $S(t)$  of  $A_\lambda u$   $S(t)$  of  $u_0$  is nothing but the limit of  $e^{tA_\lambda} u_0$  as  $\lambda$  tends to infinity.

That was the definition that is how we constructed the semigroup and therefore  $u_\lambda$  goes to  $u$  is just straightforward solutions. Now, let so we want to show that  $A_\lambda u$  goes to  $Au$  also and the 2 uniformly unbounded interval so that is what we want to show. So, let us take  $v_\lambda$  equal to solution of  $v_\lambda' = A_\lambda v_\lambda$ ,  $t$  positive and  $v_\lambda(0) = A_\lambda(u_0)$ . So, then what is the solution  $v_\lambda$  of  $t$ .

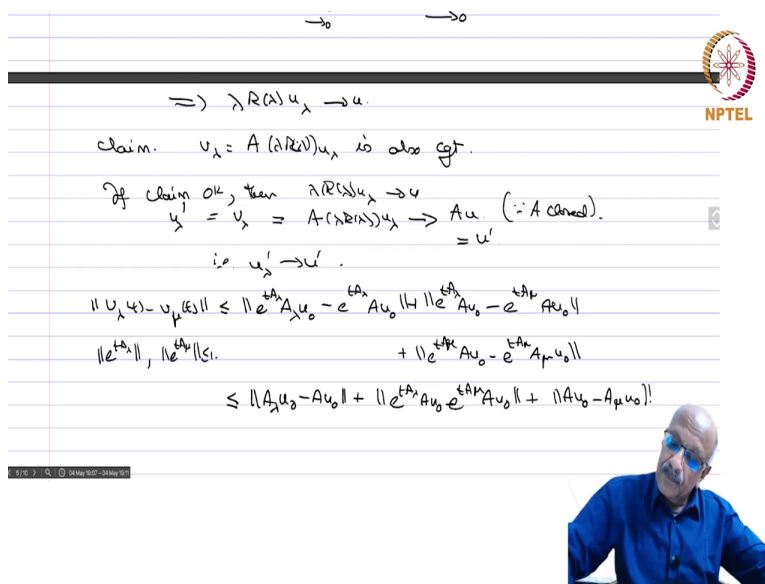

$v_\lambda(t)$  is  $e^{tA_\lambda}$  times the initial condition  $A_\lambda u_0$  it is equal to  $A_\lambda e^{tA_\lambda} u_0$  which is  $A_\lambda v_\lambda$ . Sorry  $A_\lambda u_\lambda(t)$  which is nothing but  $u_\lambda'(t)$  that is how because it is the solution of the differential equation.  $e^{tA_\lambda} u_0$  is the solutions of this differential equation. So,  $A_\lambda u_\lambda(t)$  is nothing but  $u_\lambda'(t)$ . So, we have  $v_\lambda = u_\lambda'$ . And what is  $A_\lambda$ ? Which is  $A_\lambda R(\lambda)$  of  $u_\lambda$ .

So,

$$\begin{aligned} \|\lambda R(\lambda)u_\lambda - u\| &\leq \|\lambda R(\lambda)(u_\lambda - u)\| + \|\lambda R(\lambda)u - u\| \\ &\leq \|u_\lambda - u\| + \|\lambda R(\lambda)u - u\|. \end{aligned}$$

Now,  $\|\lambda R(\lambda)\| \leq 1$  and therefore, this is less than equal to norm of  $u_\lambda$  minus  $u$  plus norm of  $\lambda R(\lambda)u$  minus  $u$ . Now, we know for all  $u$  this goes to 0 and then this goes to 0. Because we saw by the Hille Yosida theorem  $u$  goes to 0.

(Refer Slide Time: 17:37)

Handwritten notes on a slide:

$\Rightarrow \lambda R(\lambda) u_\lambda \rightarrow u.$

claim.  $v_\lambda = A(\lambda R(\lambda) u_\lambda)$  is also cgt.

If claim ok, then  $\lambda R(\lambda) u_\lambda \rightarrow v$   
 $v_\lambda = v_\lambda = A(\lambda R(\lambda) u_\lambda) \rightarrow Au \quad (\because A \text{ closed}).$   
 $= u'$   
 i.e.  $u'_\lambda \rightarrow u'.$

$\|v_\lambda(t) - v_\mu(t)\| \leq \|e^{tA_\lambda} A_\lambda u_0 - e^{tA_\lambda} A u_0\| + \|e^{tA_\lambda} A u_0 - e^{tA_\mu} A u_0\|$   
 $\|e^{tA_\lambda}\|, \|e^{tA_\mu}\| \leq 1$   
 $\leq \|A_\lambda u_0 - A u_0\| + \|e^{tA_\lambda} A u_0 - e^{tA_\mu} A u_0\| + \|A u_0 - A_\mu u_0\|$

NPTEL logo and a video feed of a lecturer in a blue shirt.

So, we have that so this implies that  $\Rightarrow \lambda R_\lambda(u_\lambda) \rightarrow u$  and what is

$$v_\lambda = A(\lambda R(\lambda) u_\lambda).$$

And we claim is also convergent suppose we prove this claim so, you

$\lambda R_\lambda u_\lambda \rightarrow u$  and  $v_\lambda$  is  $A$  of  $\lambda R_\lambda$  is also convergent  $A$  is a closed operator. So,  $v_\lambda$  must go to  $v$ . So, and therefore, you will have by the closeness you will have it will go to  $u$  of  $t v_\lambda$  will  $v_\lambda$  is  $u_\lambda$  dash  $t$  which will go which will converge to  $u$  dash of  $t$ . So, that is what it will go to  $A$  of  $u$  which is  $u$  dashed of  $t$  by the closeness of the operator and therefore, you have so, if claim then  $\lambda R_\lambda u_\lambda$  goes to  $u$  and  $A_\lambda R(\lambda) u_\lambda$  must converge to something which must converge to  $A$  of  $u$  since  $A$  is closed. And that is but  $\lambda R(\lambda)$  is  $v_\lambda$  which is  $u_\lambda$  dash and that goes to  $A u$  which is equal to  $u$  dash.

And we will show that this happens uniformly unbounded introverts that is  $u'_\lambda \rightarrow u'$ . So, that is what we want. So, we want to show the claim so now so we will show that  $\{v_\lambda\}$  is a Cauchy sequence. So,

$$\|v_\lambda(t) - v_\mu(t)\| \leq \|e^{tA_\lambda} A_\lambda u_0 - e^{tA_\lambda} A u_0\| + \|e^{tA_\lambda} A u_0 - e^{tA_\mu} A u_0\| + \|e^{tA_\mu} A u_0 - e^{tA_\mu} A_\mu u_0\|.$$

That is the definition of  $v_\mu(t)$ . So, we have all these things. So, now

$$\|e^{tA_\lambda}\| \leq 1 \text{ and } \|e^{tA_\mu}\| \leq 1$$

So, we call that so, this will be less than or equal to first one is nothing but

$$\begin{aligned} \|e^{tA_\lambda} A u_0 - e^{tA_\mu} A u_0\| &\leq t \|A_\lambda A u_0 - A_\mu A u_0\| \\ &\leq t \|A_\lambda(A u_0) - A(A u_0)\| + t \|A_\mu(A u_0) - A(A u_0)\| \end{aligned}$$

(Refer Slide Time: 21:27)

$\leq \|A_\lambda u_0 - A u_0\| + \|e^{tA_\mu} A u_0 - A u_0\| + \|A u_0 - A_\mu u_0\|.$

Hille-Yosida Proof (Step 1):

$$\|e^{tA_\lambda} A u_0 - e^{tA_\mu} A u_0\| \leq t \|A_\lambda A u_0 - A_\mu A u_0\|$$

$$\leq t \|A_\lambda(A u_0) - A(A u_0)\| + t \|A_\mu(A u_0) - A(A u_0)\|.$$

---

$$\|u_\lambda(t) - v_\mu(t)\| \leq \underbrace{\|A_\lambda u_0 - A u_0\|}_{\rightarrow 0} + \underbrace{\|A_\mu u_0 - A u_0\|}_{\rightarrow 0} + t \underbrace{\|A_\lambda(A u_0) - A(A u_0)\|}_{\rightarrow 0} + t \underbrace{\|A_\mu(A u_0) - A(A u_0)\|}_{\rightarrow 0}.$$

$u_0, A u_0 \in D(A)$

$\Rightarrow$  unif in both intervals with  $t^2 + 1$ .

$\Rightarrow \{u_\lambda(t)\}$  unif convy  $\Rightarrow u$

If claim OK, then  $\lim_{\lambda \rightarrow \infty} R(\lambda)u_\lambda \rightarrow u$   
 $u'_\lambda = v_\lambda = A(\lambda B(\lambda))u_\lambda \rightarrow Au$  ( $\because A$  closed).  
 i.e.  $u'_\lambda \rightarrow u'$ .

$\|v_\lambda(t) - v_\mu(t)\| \leq \|e^{tA_\lambda} u_0 - e^{tA_\mu} u_0\| + \|e^{tA_\lambda} u_0 - e^{tA_\mu} u_0\|$   
 $\|e^{tA_\lambda}\|, \|e^{tA_\mu}\| \leq 1$

$\leq \|A_\lambda u_0 - A_\mu u_0\| + \|e^{tA_\lambda} A_\mu u_0 - e^{tA_\mu} A_\mu u_0\| + \|A_\mu u_0 - A u_0\|$

Hille-Yosida Proof (Step 1):  
 $\|e^{tA_\lambda} A_\mu u_0 - e^{tA_\mu} A_\mu u_0\| \leq t \|A_\lambda A_\mu u_0 - A_\mu A_\mu u_0\|$   
 $\leq t \|A_\lambda(A_\mu u_0) - A(A_\mu u_0)\| + t \|A_\mu(A_\mu u_0) - A(A_\mu u_0)\|$

So, now let us see what is the middle term. So again, from the Hille Yosida proof and that is step 1. We have already seen this  $e$  power Now, that is well defined because  $Au_0 \in D(A)$  because  $Au_0 \in D(A^2)$ .

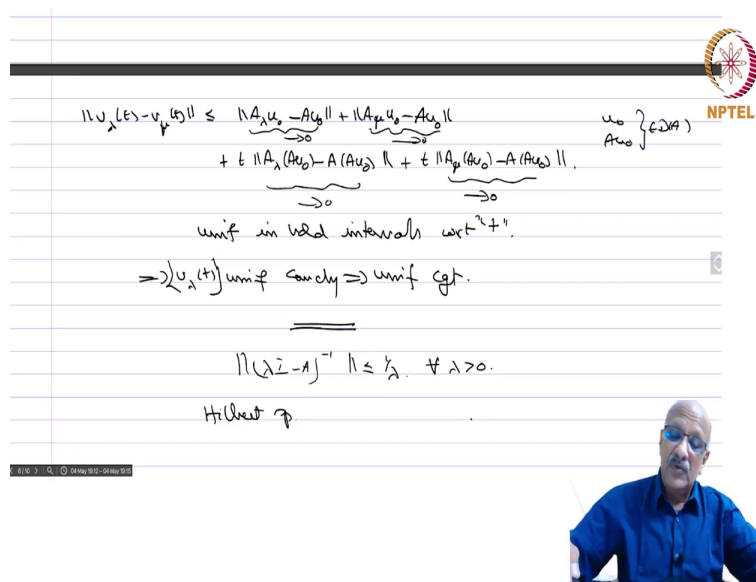

That is why we are using this plus  $t$  of norm of  $A_\mu A(u_0)$  minus  $A$  of  $Au_0$ . I have added and subtracted the whole thing. So now, combine these two. So we have that

$$\|v_\lambda(t) - v_\mu(t)\| \leq \|A_\lambda u_0 - Au_0\| + \|A u_0 - Au_0\| + t\|A_\lambda(Au_0) - A(Au_0)\| + t\|A_\mu(Au_0) - A(Au_0)\|.$$

And then all these terms go to 0 because  $u_0$  is in the domain. So, by early lemma this goes to 0 for the same reason this also goes to 0 as  $\lambda, \mu \rightarrow \infty$  tends to infinity. And then this again goes to 0 and once more because  $Au_0$  so  $u_0, Au_0$  are both in  $D(A)$ . And by the lemma all these goes to 0 and of course uniformly in bounded  $t$  intervals.

If  $t$  is in a bounded interval you can replace this space of capital  $T$  which is fixed. So, independent of  $T$  you can choose  $\lambda, \mu$  sufficiently large and then it will be a Cauchy sequence. So, uniformly Cauchy implies uniformly convergent. And then by whatever we said earlier we have that if the claim is true and because of the closeness the theorem remains proved.

(Refer Slide Time: 24:48)

$$\|u_\lambda(t) - v_\lambda(t)\| \leq \|A_\lambda u_0 - A u_0\| + \|A u_0 - A u_0\|$$

$$+ t \|A_\lambda(A u_0) - A(A u_0)\| + t \|A_\lambda(A u_0) - A(A u_0)\|.$$

$$\xrightarrow{\rightarrow 0} \text{unif in } [0, t] \text{ interval } \text{wrt } t^2.$$

$$\Rightarrow \{u_\lambda(t)\} \text{ unif conv } \Rightarrow \text{unif conv.}$$

$$\|(\lambda I - A)^{-1}\| \leq \frac{1}{\lambda}, \quad \forall \lambda > 0.$$

Hilbert space

So, our next thing we will see is in the context of Hilbert space, the Hille Yosida theorem becomes even more beautiful. So, for what did we need to know for the Hille Yosida theorem we needed to show that  $\lambda I - A$  inverse this was the crucial thing exists and its norm is less than or equal to  $\frac{1}{\lambda}$ . Now, this can be enough to say for all  $\lambda > 0$ . In the case of a Hilbert space we will show that it is enough to check just for  $\lambda = 1$ . Then it will automatically be true for all  $\lambda$  that makes our life even more pleasant. And then we will see some special cases and that will lead to various applications to the standard PDEs which we will then see. So, we have we will stop here.
