NON-MEASURABLE SETS.

$\mathcal{P} \subset \mathcal{R} \subset \mathcal{B}_N \subset \mathcal{Z}_N \subset \mathcal{H}(\mathcal{R}) = \mathcal{P}(\mathcal{R})$   
 $\downarrow$   
 + Borel  $\mu^*$ -me sets.

$x, y \in [0, 1) \quad x \dot{+} y = \begin{cases} x+y & \text{if } x+y < 1 \\ x+y-1 & \text{if } x+y \geq 1. \end{cases}$   
 $E \subset [0, 1) \quad y \in [0, 1)$   
 $E \dot{+} y = \{x \dot{+} y \mid x \in E\}.$

Lemma.  $E \subset [0, 1) \quad y \in [0, 1)$  If  $E$  is measurable then so is  $E \dot{+} y$  and  
 $m_1(E \dot{+} y) = m_1(E).$

Pf.  $E_1 = E \cap [0, 1-y) \quad E_2 = E \cap [1-y, 1).$

$x, y \in [0, 1) \quad x \dot{+} y = \begin{cases} x+y & \text{if } x+y < 1 \\ x+y-1 & \text{if } x+y \geq 1. \end{cases}$   
 $E \subset [0, 1) \quad y \in [0, 1)$   
 $E \dot{+} y = \{x \dot{+} y \mid x \in E\}.$

Lemma.  $E \subset [0, 1) \quad y \in [0, 1)$  If  $E$  is measurable then so is  $E \dot{+} y$  and  
 $m_1(E \dot{+} y) = m_1(E).$

Pf.  $E_1 = E \cap [0, 1-y) \quad E_2 = E \cap [1-y, 1).$   
 $E_1, E_2$  are disjoint.  $E = E_1 \cup E_2$   
 $m_1(E) = m_1(E_1) + m_1(E_2)$

**Non-Measurable Sets:**

We talk a long time about non-measurable sets. So, recall how we construct the Lebesgue measure. We had  $\mathcal{P}$  which is consisting of all finite unions of the half closed intervals and then we constructed a ring note this is just these intervals, ring is finite unions of such intervals on this we had a measure  $\mu$  and then we went to the hereditary  $\sigma$  - ring which is

$H(\mathbb{R})$  which is nothing but the power set  $P(\mathbb{R})$  of the real line  $\mathbb{R}$ . And then we had the  $\mu^*$  measurable sets which are nothing but the Lebesgue measurable sets and then we had the Borel measurable sets, which are here.

I gave you an indirect argument using cardinality that this is a strict inclusion and then we will see in the next chapter specific examples of a set. So, now, we want to show that this is also a strict inclusion, namely there exists subsets of  $\mathbb{R}$  which are not Lebesgue measurable. So, that is what we want to do.

So, before we do that, let us take  $x, y \in [0, 1)$  and you define  $x$  sum  $y$  modulo of one

$$x + {}^0y = x + y \text{ if } x + y < 1,$$

$$x + {}^0y = x + y - 1 \text{ if } x + y \geq 1.$$

So, the answers will come back into  $[0, 1)$ .

So, if  $E \subset [0, 1)$ ,  $y \in [0, 1)$ . If  $E$  is measurable then so is

$$E + {}^0y = \{x + {}^0y \mid x \in E\}.$$

Now, we have the following lemma which is based on the translation invariance of the Lebesgue measures.

**Lemma:** Let  $E \subset [0, 1)$  and  $y \in [0, 1)$ . If  $E$  is measurable then so is  $E + {}^0y$  and

$$m_1(E + {}^0y) = m_1(E).$$

**Proof:** Let  $E_1 = E \cap [0, 1 - y)$ ,  $E_2 = E \cap [1 - y, 1)$ . Then  $E_1$  and  $E_2$  are obviously measurable and disjoint. And

$$m_1(E) = m_1(E_1) + m_2(E_2). \text{ Because of } E = E_1 \cup E_2.$$

$$m_1(E_i + {}^0y) = m_1(E_i) \text{ for } i = 1, 2.$$

Now  $\{E_i + {}^0y\}$  are disjoint if not there exists  $a, b \in [0, 1)$  such that

$$a + y = a + y - 1 \text{ implies that mod of } b - a = 1.$$

which is not possible because  $a$  and  $b$  are strictly less than 1.

So, then therefore, you have

$$E + {}^0y = E_1 + {}^0y \cup E_2 + {}^0y,$$

this is a disjoint union and therefore,  $E + {}^0y$  is measurable and

$$m_1(E + {}^0y) = m_1(E_1) \cup m_1(E_2) = m_1(E).$$

So, this proves the lemma.

So, now, if  $x, y \in [0, 1)$ , we say that  $x \sim y$  if  $x - y \in \mathbb{Q}$ . So, clearly  $\sim$  is an equivalence relation. So,  $[0, 1)$  gets partitioned into equivalence classes.

So,  $P$  equals a set containing exactly one representative from each equivalence class so, if you have  $[0, 1)$  gets partition that means, the disjoint union of equivalence classes takes one representative from each equivalence. So, obviously, this is based on the axiom of choice when you have such a thing that you can find such a set is precisely the statement of the axiom of choice.

(Refer Slide Time: 8:56)

Prop.  $P \subset [0,1)$  defined above is NOT mble.

Pr.  $r_0 = 0, \{r_i\}$  numbering of rationals in  $[0,1)$ .

$P_i = P + r_i, P_0 = P$

$x \in P_i \cap P_j, i \neq j, x = P_i + r_i = P_j + r_j.$

If  $P_i = P_j, r_i \neq r_j = |r_i - r_j| = 1 \times$

$P_i \neq P_j \Rightarrow P_i \cap P_j = \emptyset.$

$\Rightarrow i \neq j, P_i \cap P_j = \emptyset.$

$P$  has one elt from each eq. class,  $\bigcup_{i=0}^{\infty} P_i = [0,1)$ .

$x \in P_i \cap P_j, i \neq j, x = P_i + r_i = P_j + r_j.$

If  $P_i = P_j, r_i \neq r_j = |r_i - r_j| = 1 \times$

$P_i \neq P_j \Rightarrow P_i \cap P_j = \emptyset.$

$\Rightarrow i \neq j, P_i \cap P_j = \emptyset.$

$P$  has one elt from each eq. class,  $\bigcup_{i=0}^{\infty} P_i = [0,1)$ .

If  $P$  mble,  $m_1([0,1)) = 1 = \sum_{i=0}^{\infty} m_1(P_i) = \sum_{i=0}^{\infty} m_1(P).$

$= \begin{cases} +\infty & \text{if } m_1(P) > 0 \\ 0 & \text{if } m_1(P) = 0. \end{cases}$

$\Rightarrow P$  is not mble.

So, we have to use two properties so far, one is translation invariance of Lebesgue measure and the other is the axiom of choice. So, now proposition  $P$  contained in  $[0, 1)$  defined above is not measurable. So, proof, so you said  $r_0 = 0, \{r_i = 0\}$  numbering of rationals in  $[0, 1)$ , it is a countable set so, you can number it, only I put  $r_0 = 0$ .

So, I said  $P_i = P + r_i$ . So, then  $P_0$  is the same as  $P$  because it is 0 and if  $x$  belongs to  $P_i \cap P_j$ , where  $i \neq j$  then  $x = P_i + r_i = x = P_j + r_j$ .

If  $P_i = P_j$  then  $r_i \neq r_j$  and therefore, this equality in place and  $|r_i - r_j| = 1$  and that is not possible, it is a contradiction.

So, this means  $P_i \neq P_j$ , but then  $P_i + r_i = P_j + r_j$ . This implies that  $P_i \sim P_j$  again not possible because these are distinct elements from distinct equivalence classes and therefore this is also not possible.

So, we get that if  $i \neq j$ ,  $P_i \cap P_j = \emptyset$ .

Now, because  $P$  has one element from each equivalence class and we have taken the numbering of all the rationals therefore, we have that

$$\bigcup_{i=0}^{\infty} P_i = [0, 1).$$

So, if  $P$  is measurable,

$$m_1([0, 1)) = 1 = \sum_{i=0}^{\infty} m_1(P_i) = \sum_{i=0}^{\infty} m_1(P) = \begin{cases} +\infty & \text{if } m_1(P) > 0 \\ 0 & \text{if } m_1(P) = 0 \end{cases}$$

So, if this has to converge, then either all of them have to be 0. So, this will be equal to  $+\infty$  if  $m_1(P) > 0$  and 0 if  $m_1(P) = 0$ . So, either  $\infty$  or 0 it cannot be equal to one therefore this is not possible and therefore, you have that  $P$  is not measurable. So, we have explicitly constructed a subset of  $[0, 1)$  which is not measured.

(Refer Slide Time: 13:22)

$\Rightarrow P$  is not measurable.

Let,  $E \subset P$  measurable.  $E_i = E + r_i$ .

$\Rightarrow m_1(E_i) = m_1(E) \forall i$   $E_i$  mutually disjoint.

$\cup E_i \subset [0, 1)$

$\sum m_1(E_i) \leq 1$ .

$m_1(E) \forall i \Rightarrow m_1(E) = 0$ .

Only measurable subsets of  $P$  are subsets of measure zero.

Same true for any  $P_i = P + r_i$ .

Let  $A \subset [0, 1)$  measurable.  $m_1(A) > 0$ .

$E_i = A \cap P_i$ . If  $E_i$  measurable  $\Rightarrow m_1(E_i) = 0$

If all  $E_i$  measurable,  $A = \cup E_i$   $0 < m_1(A) \leq \sum_{i=1}^{\infty} m_1(E_i) = 0$ .  $\times$

$\Rightarrow \exists$  atleast one  $i$  st.  $A \cap P_i = E_i$  is not measurable.

$\Rightarrow A$  has a non-measurable subset.

So, now, let  $E \subset P$ ,  $E$  measurable and you said  $E_i = E + r_i$ .

$\Rightarrow m_1(E_i) = m_1(E)$  for all  $i$ ,  $E_i$  are mutually distinct by the same argument.

Now, you have

$$\cup E_i \subset [0, 1),$$

and therefore, you have

$\sum m_1(E_i) \leq 1$  and this is equal to  $m_1(E)$  for all  $i$  and therefore, this is possible only if

$$m_1(E) = 0.$$

So, only measurable subsets of  $P$  are subsets of measure 0. Same true for any  $P = P_i + r_i$ .  
So, say they will also have all these.

Let  $A \subset [0, 1)$  measurable and  $m_1(A) > 0$ . Now, you said  $E_i = A \cap P_i$ . If  $E_i$  is measurable this implies that  $m_1(E_i) = 0$  because  $E_i$  is a subset of  $P_i$  and we have seen the only measurable subsets of  $P$  or any  $P_i$  are only sets of measure 0 and so, if all  $E_i$  are measurable then

$$A = \cup E_i$$

and therefore,  $0 < m_1(A) \leq \sum_{i=0}^{\infty} m_1(E_i) = 0$ .

So, you have another contradiction therefore, there exists at least one  $i$  such that  $E_i = A \cap P_i$  is not measurable. So, implies  $A$  has a non-measurable subset. Now, you can do this in any interval.

(Refer Slide Time: 17:06)

Can repeat all this in  $[n, n+1)$   $\forall n \in \mathbb{Z}$ .

$A \subset \mathbb{R}, m_1(A) > 0 \Rightarrow A \cap [n, n+1)$  has pos. meas.

for at least one  $n \Rightarrow A$  has a subset which is not measurable.

$\mathcal{P} \subset \mathcal{R} \subset \mathcal{B}_1 \subset \mathcal{L}_1 \subset \mathcal{P}(\mathbb{R})$

NPTEL

17:06

So, you can repeat all this in  $[n, n + 1)$  for all  $n \in \mathbb{Z}$ .

If  $A$  is contained in  $\mathbb{R}$ ,  $m_1(A) > 0$  implies  $A \cap [n, n + 1)$  has to be positive measure for at least one year and implies  $A$  has a subset which is not measurable.

So, every subset of  $\mathbb{R}$  of positive measure has a non measurable subset. So, there are plenty of non measurable subsets and therefore, you have strict inclusion.

So, again let me recall for you, so, you have  $\mathcal{P}$  the set of all intervals then you have  $\mathcal{R}$  the ring and then you have the power set of the real line which headed three  $\sigma$ -ring and then you have  $\mathcal{L}_1$  which is Lebesgue measurable and then you have  $\mathcal{B}_1$  is the caratheodory construction. So, we have shown that this is not true and this also is strictly a thing that we will reinforce with a specific example later on right now. So, with this I will conclude this chapter on the Lebesgue measure. So, before proceeding further we will do some exercises next time.
